The Editor is always glad to receive for examination illustrated articles on subjects of timely interest If the photographs are sharp the articles *short*, and the facts authentic the contributions will receive special attention Accepted articles will be paid for at regular space rates

FACT AND FANCY IN AERONAUTICS

Somebody has said that the successful inventor is usually more or less of an idealist and invariably is possessed of a strong imagination Judging from the wild flights of fancy upon which an epoch making invention serves to launch the innumerable army of magazine writers we might add that in addition to being an imaginative idealist he would seem to be something of a hypnotist as well

As a matter of fact although the inventors of the steam engine the telegraph and the flying machine were necessarily possessed of a creative imagination they were essentially of a practical and conservative turn of mind Stephenson Morse Marconi and the Wright brothers may have found time in the midst of their busy hours to glance at the future and be momentarily thrilled at the thought of its splendid speculative possibilities but in the main they were too conscious of the inherent limitations of their inventions too strongly engrossed in the effort to work out patiently each nearest problem as it arose to indulge in wild prophecy of future accomplishment

The attitude of the Wright brothers during their wonderful demonstration of the possibility of mechanical flight may be referred to as proving the truth of the above observations Although they have created the art at least as far as its practical expression is concerned we doubt if anyone who has spoken or written on the subject of the development of flight has been more reluctant to predict the achievements of the future or more conservative in pointing out the inherent limitations of the art On the other hand it is rarely that the birth of a new invention has brought forth such a flood of preposterous and impossible literature as has appeared during the last few months on the military and commercial future of the dirigible and the aeroplane

Without in the least disparaging the fine achievements of Lebaudy Zeppelin the Wright brothers Curtiss Farman Bleriot and others whose intelligence pluck and perseverance have made aerial flight the sensation of the day we wish to draw attention to the fact that in their present state of development neither the dirigible nor the aeroplane has the slightest practical military value The best that can be said of them is that when certain inherent defects have been overcome they may in a limited degree be put to military use At the present writing this field would seem to lie exclusively in the direction of scouting and the carrying of dispatches

In proof of this we point to the fact that at present both the dirigible and the aeroplane and particularly the latter require both for their starting and landing the provision of a large fairly level field or campus free from the obstruction of trees telegraph poles and wires and buildings In the case of the aeroplane it is even necessary for safe starting and stopping that the surface be free from tall weeds or grass, for should the machine in coming to the ground dip sufficiently for one wing to sweep in among the long grass the contact is sufficient to swing it violently around across its course at the risk of wrecking the chassis or runners Furthermore the well known reluctance of the aeronaut to start into the air in anything stronger than a moderate breeze particularly if the wind be variable is very significant of the present crude condition of the art considered in respect of its commercial or military value We do not hesitate to affirm that there are many years of patient mechanical development and practice in the air ahead of us before we shall see the production of an aeroplane which can arise or alight (as it must necessarily do to be of practical value) with that independence of time place and weather conditions which marks the flight and the coming and going of the birds of the air

Perhaps the most absurd of the military claims made for the airship and aeroplane is that of their ability to sail over hostile territory and destroy cities fortifications and military depots by the expedient of dropping high explosives In view of the great range of modern artillery and the fact that a special type is now being developed to repel airship attack the machine must operate at a height of at least a mile above the earth if it is to be safe from shrapnel and the special shells which will be furnished for its destruction At that height it would be a question of the merest chance if a bomb released from the machine struck the object aimed at There would be no means of determining if the fort magazine etc was in exact vertical alignment at the moment the missile was dropped Allowance would have to be made for the velocity of the wind which velocity could not be known to those who were moving in midair Moreover the direction of the flight of the projectile would be the resultant of the vertical velocity due to gravity and the horizontal velocity of the ship itself Consequently to make a hit the projectile would have to be released before the machine was vertically over the object and at a certain specified distance ahead of the vertical line How would the operator determine the exact moment at which to let go? It is evident that even approximately accurate aiming would be out of the question and the limited amount of ammunition which could be carried even by a large dirigible would render an attempted bombardment the most foolish kind of a farce The 11 inch high explosive shells with which the Japanese bombarded the Russian fleet in Port Arthur failed to inflict vital damage It is now well known that the Russian ships were sunk by the Russians themselves who opened the seacocks and flooded them In the many weeks of bombardment the Japanese hurled hundreds of tons of 11 inch shells on the Russian fortifications fleet and buildings without bringing Port Arthur to capitulation It was the sappers and miners that reduced the fortress The damage that would be inflicted on a beleagured city by a whole fleet of dirigibles could never by any possibility have a decisive effect upon the issues of the war

We repeat that the *present* indications are that the airship and aeroplane of the future even when they have been developed to their ultimate perfection will find their field of usefulness exclusively in the work of scouting and the carrying of dispatches

THE CAPE COD CANAL

The turning of the first sod in the work of cutting the Cape Cod canal on Tuesday June 22nd which took place on the farm on which Commodore Perry of Lake Erie fame was born was an event of more than local significance Great as the value of the canal will be in shortening the sailing distance between New York and Boston and avoiding the perils of navigation around the greatly dreaded Cape Cod the new waterway will ultimately take on a national and military value as forming an important link in that future system of related canals along the Atlantic seaboard which has come to be known as "the inside route" by which it will be possible for shipping to make the voyage from Boston to Norfolk Va in sheltered bays inland waters and reaches of canal without once passing outside the ultimate coast line

The canal will extend for eight miles from Barnstable Bay to Buzzards Bay and at each entrance will be approaches which will bring the total length of the canal up to 12 miles It will have a surface width of from 250 to 300 feet a bottom width of 160 feet a least depth at low water of 25 feet, and a mean high water depth of about 30 feet The canal will be built at sea level and with these generous dimensions it should prove adequate for many years to come for the class of coastwise freight and passenger steamers that will make use of it

The Cape Cod canal will form then the first link in a chain of interior waterways, which because of its commercial and military value is certain of ultimate construction A ship sailing from Boston for Norfolk after leaving the southerly entrance to Cape Cod canal would run through Buzzards Bay into Long Island Sound and thence by way of the East River and New York Bay to the Raritan River From the Raritan it would proceed by canal across New Jersey to the Delaware River and the present canal from the Delaware River to Chesapeake Bay after deepening would carry the ship to deep water in which she could reach Norfolk on a clear course. [illegible] not con[illegible] the [illegible] on the [illegible] ity as the Cape Cod canal. Ultimately, as traffic developed, this section would be widened and deepened to accommodate a larger type of ship

The advantage of the inside route from the military point of view is that it would make it possible to transfer gunboats torpedo boats, and submarines from one fort or harbor to another, without interference by a blockading fleet of the enemy The advocates of the canal claim that the elimination of the dangers of the outside coast route especially at Capes Cod and Hatteras would greatly stimulate the coastwise trade, the increase of which coupled with the reduction in the time of passage would have a marked effect in cheapening the cost of the transportation and reducing railroad rates. It is estimated by the engineers that the Cape Cod canal will be completed in from three to four years at a cost of $12 000,000 The borings along the route have revealed the existence of sand and gravel with some clay and the work of construction will be mainly one of straightforward dredging

THE COPYRIGHT ACT.

The new copyright act about which there has been so much agitation for the past two or three years, is now an accomplished fact the provisions of the act having gone into effect on July 1st, 1909 This new measure cannot be said to be amendatory in any way, for it prescribes an entirely new form of procedure

For a long period of time lawyers when advising their clients with reference to the requirements which should be followed to obtain copyright protection in the United States have emphasized the necessity of complying with the provisions of the copyright act before the subject matter is published The new act completely upsets this long established practice for it provides unqualifiedly for the publication of a book or other such work with the notice of copyright printed thereon as the first step toward procuring the protection desired After the publication of the work, with the notice of the copyright an application for copyright registration must be filed with two copies of the work In cases where the work is not to be reproduced in copies for sale the registration is secured by filing with the application a manuscript or typewritten copy if the subject matter be an oral address a dramatic composition or a similar work and should the subject matter be a drawing sculpture or a similar work a photograph thereof should be filed with the application

When a book of foreign origin is printed in a foreign language it is unnecessary that the book be printed in the United States but this is an exception to the general provision which requires that the printing of a book shall take place within the limits of the United States Books published abroad in the English language may be protected by an *ad interim* copyright but the application must be filed within thirty days of the publication abroad and as the term of the *ad interim* copyright is only thirty days it is necessary to reprint the book in the United States and publish it not later than during the sixty days following the foreign publication

The scope of a copyright registration of a musical composition has been extended to enable the proprietor to prevent others from copying the subject by mechanical means but should the proprietor permit the subject matter to be reproduced by such mechanical means he may be compelled to grant licenses permitting others to use the subject matter on similar means for reproduction, the licensee to pay a reasonable consideration for the grant of the license.

The term of the copyright registration is still twenty eight years but the renewal term has been extended from fourteen years to twenty-eight years

◆

At the First Census but six cities reported a population of approximately 8 000 inhabitants Compared with this number in 1900 there were two hundred and eighty-six cities and towns in the same area having a population of 8,000 or more. In Rhode Island alone, the smallest of all the States, there were more cities of 8 000 inhabitants than there were in the entire United States in 1790 The aggregate population of all cities in the area enumerated in 1790 which in 1900 reported more than 50 000 inhabitants, was [illegible] in 1790, and 10 [illegible] in 1900 Although the total population of the United States increased rapidly from 1790 to 1900, the relative population weight of New York, Philadelphia, Boston, and Baltimore increased even more rapidly. In 1790 their combined population was but little more than 100,000 and formed but [illegible] the population of the Republic; but in [illegible] approximately 6,000 000 or nearly [illegible] in 1790, and formed [illegible] per cent of the [illegible] the Republic. The population in 1900 of [illegible] ally enumerated as comprising these four cities in 1790 was 590 000 or a sixfold increase of inhabitants within the original city limits

ENGINEERING.

The cost of foundations for new buildings in New York runs at times into very high figures. The contract for the foundation work of the new 25-story Municipal Building to be erected at the Brooklyn Bridge entrance has just been let to the Foundation Company for $1,443,147. The caissons must be carried down below the Subway station to rock, which lies in places 80 feet below street level.

The work of constructing the Cape to Cairo Railway is to be started again in the near future. The present end of the line is 370 miles north of Victoria Falls and it is expected to carry the line into the Congo copper district during the present season. The new line will [illegible] an all rail route. A considerable part of the distance will be covered by steamers on the great interior lakes of Africa.

Both Canada and Australia have followed the lead of New Zealand in the decision to contribute to the naval defense of the empire. The federal government of Australia has voted to build one "Dreadnought" for the British navy. The Canadian government will build and man a navy of its own to act as an auxiliary force to the fleet of Great Britain. The plans call for the construction of eight first-class cruisers of the "Cornwall" type of 10 000 tons displacement, ten torpedo-boat destroyers and ten torpedo boats. The fleet will be built in Great Britain and the time and cost of construction are to cover the next five years.

It is well known that the amount of snowfall in the Rocky Mountains determines the flow of water in the leading rivers that head in this range. Consequently the snowfall has an important bearing in determining the volume of the floods which frequently devastate the middle Western States. Many of the most important irrigation ditches moreover depend for their supply upon the annual snowfall. To place it in a position to make an accurate forecast of the amount of water that will be released by the melting snow the United States Weather Bureau has established a series of snow-gaging stations in the Rocky Mountains.

Two self contained motor street cars operating independently of underground or overhead conductors are to receive an important test on some of the branch lines of the Third Avenue Company in New York city. One of these will be of the storage battery type and the other will be driven by a combined gasoline electric engine. The gasoline engine will drive an electric generator whose current will be fed to the motors at the axles. If the experiment is a success several lines whose business would not stand the large initial outlay for trolley construction will be equipped with whichever car of the two types proves more serviceable.

It is stated that the Union Pacific Railway is planning to plant its right of way from the Missouri River to the Pacific with alfalfa. At each edge of the right of way also will be planted a row of pine trees alternating with elms, there being a tree at intervals of every two rods. As the alfalfa becomes green early in the spring and remains so until late in the fall the ornamental effect should be decidedly pleasing. Furthermore it is claimed that the grass and trees will furnish in certain localities a decided protection against snow drifts and washouts. It is stated that the Chicago Milwaukee & St Paul Railroad proposes to do similar planting and grassing between Ottumwa and Kansas City.

In one of a series of articles on English railways in the Railroad Age Gazette the writer W W Turlay states that the most important things we can learn from freight service in England are prompt dispatching and delivery. Small lots of freight are collected by the railroad company's own wagons taken to the station forwarded and delivered during the forenoon of the following day to the consignees by the railway company's wagons. A wholesale merchant in London can have a case of dry goods taken from his warehouse in the afternoon and count on its being delivered to his retail customer in Manchester 183½ miles distant the following morning at rates of from 72 cents for 112 pounds to $1.80 for 336 pounds and for amounts above 336 pounds at the rate of 42 cents per 100 pounds.

A notable step in the preliminary work of selecting the site for a bridge across the Hudson River to be built jointly by the States of New York and New Jersey, was taken when the Governors of the two States recently inspected the two sites which had been selected as the most available, one at 179th Street and the other at 59th Street. A bridge at 59th Street would cost [illegible], and one at 179th Street, $10 000 000. The 59th Street site was favored by the Governor of New Jersey and the 179th Street location by the Governor of New York. A bridge at 59th Street would have the great advantage of providing a direct route from Jersey through 59th Street and over the new Queensboro Bridge to Long Island. Furthermore, it would tap one of the most important business centers [illegible] Island.

AERONAUTICS.

Saturday, June 26th, was the hottest day of the year so far and the fact that about 2 000 people made the ¾ hour journey via subway and trolley car to Morris Park, Westchester and paid $1 each for admission, augurs well for the future exhibitions of flight which the Aeronautic Society proposes to hold at frequent intervals throughout the summer. Last Saturday for the first time New Yorkers had an opportunity to witness a flight by a heavier than air flying machine and great credit is due the energetic officers and members of the Aeronautic Society for having provided this exhibition at a time when the attention of the public is drawn to the subject of flying by Orville Wright's second attempt to fulfill the government requirements of a one hour flight with passenger and a 10 mile cross country speed test at Fort Myer on the outskirts of Washington D C. With the exception of this gentleman Glenn H Curtiss is the only other American aviator who has publicly flown in our country and Saturday was the first time he had ever made an exhibition flight before a large crowd of spectators. On July 4th last he became the first winner of the Scientific American Trophy by making a mile flight across the fields in the aeroplane "June Bug" at his home at Hammondsport N Y. Mr Curtiss was at that time a member of Dr Alex Graham Bell's Aerial Experiment Association and the "June Bug" was the third successful aeroplane which the association had built. His new biplane which he has constructed for the Aeronautic Society is the lightest and fastest aeroplane of this type ever produced and the flights executed with it last Saturday showed it to be an excellent flyer. In a speed test it traveled 46.7 miles an hour. Its small size (29 feet spread) light weight (400 pounds complete) and slight head resistance making it considerably faster than the Wright machine although it has only the same power (25 horse power).

The visitor at Morris Park last Saturday found much that was interesting on exhibition on the lawn in front of the grand stand. There were several aeroplanes not quite completed as well as models and a full size helicopter intended to be worked by foot power by two men. The blades were rotated in this manner but the machine showed no tendency to rise. There was sufficient breeze for some school boys to fly with kites and a score of them had a contest. At about 4 P M Mr Curtiss made his first straight line flight. Starting near one end of the track he flew nearly to the other end and alighted in front of the grand stand. He then turned the machine around and flew back again. Each flight was about a third of a mile in length. Next Mr William H Martin a farmer and civil engineer of Canton O was towed in his glider by a Kissel automobile. This glider is a monoplane with planes beneath it set at a dihedral angle. It is provided with rudders and mounted upon a boat shaped frame on three wheels. The auto towed it too fast and the glider got swaying badly. Then the rope broke and the machine swerved to one side and smashed through the picket fence. Mr Martin who is quite a heavy man was thrown over the fence upon the lawn. Fortunately he received no serious injuries. The society's wind wagon which has a 24 horse-power 4 cylinder air cooled motor and an 8 foot propeller made several sprints around the track at a 30 mile-an hour clip and managed to cast a tire off of one of the steering wheels. It next engaged in a tug-of war with an ancient 2 cylinder Autocar runabout. If it could get a start and jerk the runabout it could pull the latter backward but otherwise the latter was the victor. Two hot air balloons were inflated and sent up with a man and a woman respectively. Both aeronauts made successful parachute jumps and landed on the grounds. Very late in the afternoon Frederick Schneider was shot off by the catapult in his Wright type aeroplane fitted with the Society's motor but even though the propellers were running nicely the machine only traveled 25 or 30 feet beyond the end of the rail the thrust developed by the propellers being insufficient to make it fly.

It was nearly 8 P M before the breeze died down sufficiently to enable Mr Curtiss to make a flight with turns. Most of the spectators remained however and they found it well worth while. Starting again from the end of the track farthest away from the grand stand he flew down past the spectators at a height of 25 feet gracefully circling round the small bend and traveling rapidly up the other side of the course. Then he turned again and alighted at the wide end of the egg-shaped track. The spectators cheered and applauded throughout the entire flight which lasted about 2 minutes. While by no means so noisy and dusty as the first track automobile races used to be this first circular flight above a race track in America was truly spectacular, and without doubt, when it is repeated and prolonged into repeated circlings many more thousands of people will flock to see it. It is probable that on July 5th Mr Curtiss will attempt to set up a record for the Scientific American Trophy.

SCIENCE

Lieut. Shackleton has returned to England. He will lecture before the Royal Geographical Society on his Antarctic discoveries.

Prof. George E Hale of the Mount Wilson Observatory has been honored in France by his fellow scientists. His researches on the sun and on stellar evolution are regarded as authoritative.

The largest order for radium in the history of radio activity was placed jointly by Sir Ernest Cassel and Lord Iveagh. The quantity ordered is 7½ grammes equivalent to about ¼ avoirdupois ounce and the price is $150 000. This quantity of radium is to be donated to the Radium Institute to which attention has already been called in these columns.

A Chinese takin has been mounted in the American Museum of Natural History. The animal was captured in the mountainous regions of China and was presented to the museum by Mason Mitchell former American consul to China. The takin has the characteristics of an antelope and a goat.

It is said that a new supply of radium has been discovered in Portugal by Thomas H V Bower a member of the American Institute of Mechanical Engineers. A certain stream the name of which is not disclosed was reputed to have therapeutic properties. Mr Bower followed the stream to its source and discovered that it ran over a bed of uranium phosphate.

Observations of the height of clouds made by directing a searchlight vertically upward and determining the angular elevation of the illuminated patch of sky from a fixed base station were continued at the astronomical observatory at Vienna during the summer of 1908. The results show that media capable of reflecting light were frequently found to exist at heights greater than 10 kilometers. The column of light could be traced up to an altitude of 17.1 kilometers on May 31st and to 16 kilometers on July 27th. The greatest cloud height was observed at 8 kilometers. The height of the dust or smoke layer over the city was fixed on two occasions at 300 meters and 120 meters respectively. Confirmatory observations were made occasionally from a second station distant 8.3 kilometers from the source of light.

The substances commonly used for impregnating roofing paper and roofing cloth are not permanent in the air. The desideratum is a substance of slight volatility and high boiling point which would be durable when exposed to the air and would resist high temperatures. India rubber fulfills these requirements but it is too expensive for use. A recent German patent describes the preparation of a cheap substitute for India rubber for this purpose. The pitch like residues of petroleum coal tar certain animal substances (wool grease and other fatty matters) and some mineral substances (ozokerite and mineral wax) are exposed at a high temperature to a blast of air and to the oxidizing action of manganese dioxide and sulphuric acid and are subsequently treated with formaldehyde.

A series of experiments has been made by T Koerner in Germany in order to find out what proportion of alcohol can be obtained from wood using the well known process of converting the wood into sugar by hydrolysis and then using the sugar to form alcohol by fermentation. He made tests with sawdust wood pulp and like materials. The matter was treated with dilute sulphuric acid and heated in a digester in which the pressure could reach 10 atmospheres. It is to be noted that all the sugars are not fermentable so that the percentage of alcohol must be obtained directly after the fermentation and is not to be estimated from the amount of sugar. The addition of sulphurous gas which is sometimes recommended is found to be a drawback for the production of alcohol. He finds that the yield of alcohol is low at best. For wood paste it is not more than 12.6 per cent and for dry wood 6 per cent. From the present tests he concludes that it is not commercially practicable to obtain alcohol from wood in the above way.

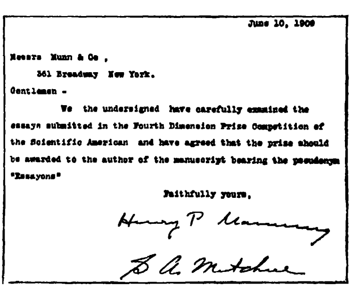
The determination of the characters of fibers composing a fabric by means of combined microscopic and chemical examination is often made impossible by interference with the characteristic reactions by the dyestuffs and metallic salts with which the fabric is loaded. On the other hand the usual methods of removing dyes from specimens are apt to injure or destroy the fabric. In a method proposed by Copetti the dye is discharged by means of hydrofluoric acid. The sample of fabric is steeped five or ten minutes in commercial hydrofluoric acid contained in a leaden vessel. It is then washed in water treated successively with soap 5 per cent hydrochloric acid hypochlorite of lime again with hydrochloric acid and is finally washed and dried. The dye may also be completely removed by treatment with permanganates and sulphurous acid after the hydrofluoric acid bath. This process leaves the fibers intact so that they can be recognized by microscopic examination and other tests.

THE FOURTH DIMENSION SIMPLY EXPLAINED

The Essay that Won the $500 Prize Offered by a Friend of the Scientific American.

BY ESSAYONS (LIEUT-COL GRAHAM DENBY FITCH CORPS OF ENGINEERS U S A)

It is impossible to form a mental picture of the fourth dimension Nevertheless it is not an absurdity but a useful mathematical concept with a well developed geometry involving no contradictions To gain a partial and symbolic idea of its meaning resort must be had to analogy with dimensions of a lower order



June 10, 1909

Messrs Munn & Co ,

361 Broadway New York.

Gentlemen -

We the undersigned have carefully examined the essays submitted in the Fourth Dimension Prize Competition of the Scientific American and have agreed that the prize should be awarded to the author of the manuscript bearing the pseudonym "Essayons"

Faithfully yours,

Henry P Manning

S A Mitchell

An aggregate is said to be one two or three-dimensional according as one two or three numbers are necessary to determine any one of its elements Considering space as an aggregate of points a line is a one dimensional space because to determine the position of any point on it one number giving its distance from some fixed point suffices Similarly a plane is a two-dimensional space and the point aggregate of ordinary space is three dimensional Thus the exact position of any point of the earth is known when its latitude longitude and elevation above sea level are given Now if we have four variable related quantities each capable of assuming independently of the others every possible numerical value we obtain a four-dimensional aggregate Such an aggregate if of points constitutes four-dimensional space

If we connect all points of our space (a 3-space) with an assumed point outside of it then the aggregate of all the points of the connecting lines constitutes a 4 space (hyperspace) Again just as a point moving generates a line just as a line moving outside itself generates a surface and a surface moving outside itself generates a solid so a solid moving outside of our space generates a hypersolid or portion of hyperspace Or hyperspace itself may be conceived as generated by our entire space moving parallel to itself in a direction not contained in itself just as our space may be generated by the similar motion of an unlimited plane which may itself be generated by an unlimited right line Any space is that which forms the boundary between two portions of a higher space and just as every unlimited plane divides our space into two equal infinite parts so every 3 space divides hyperspace into two equal infinite regions between which that space forms a boundary of an infinitely small thickness in the fourth dimension

Two plane figures (say triangles) if in the same plane may partially coalesce but cannot intersect unless in different planes similarly two volumes (say cubes) if in the same 3 space may partially coalesce but cannot intersect unless in different 3 spaces In hyperspace we have the following possible intersections A hypersolid and a 3 space intersect in a solid two 3-spaces in a plane three 3 spaces in a right line four spaces in a point a 3 space and a plane in a right line a 3 space and a right line in a point and two planes in a point If the intersections are at an infinite distance the intersecting elements are said to be parallel and if two 3 spaces are parallel all figures or volumes in one 3 space are at equal distances from the other 3 space In the case of planes there are two kinds of parallelism and parallel planes are either completely or incompletely parallel according as they are in the same or different 3 spaces or as their intersection at infinity is a right line or a point

To a given right line at a given point one can erect in a plane but one perpendicular while in a 3-space one can erect an infinite number of perpendiculars forming together a perpendicular plane and in hyperspace an infinite number of perpendicular planes forming together a 3 space perpendicular to the given right line A 3 space can also be perpendicular to a plane or to another 3 space Planes may be perpendicular in two ways incompletely or completely perpendicular according as they are in the same 3-space or not In the latter case every right line of either plane is perpendicular to every right line of the other

The position of a point in a plane may be determined by its distance from each of 2 perpendicular right lines in our space by its distance from each of 3 mutually perpendicular planes and in hyper space by its distance from each of 4 mutually perpendicular 3-spaces In hyperspace these distances are accordingly measured along 4 mutually perpendicular right lines which taken by twos determine 6 mutually perpendicular planes and taken by threes, determine the above mentioned 4 mutually perpendicular 3 spaces Just as in our space it requires at least 3 points to determine a plane so in hyperspace it requires at least 4 points to determine a 3 space A 3-space may also be determined by 2 non intersecting right lines or by a plane and one point not in it.

Just as portions of our space are bounded by surfaces plane or curved so portions of hyperspace are bounded by hypersurfaces (three-dimensional) i e flat or curved 3-spaces. Hyperspace contains not only an infinite number of flat 3-spaces like ours but also an infinite number of curved 3-spaces or hypersurfaces of different types A hypersphere, for instance, is a closed hypersurface all the points of which are equally distant from its center Five points not in the same 3 space determine it just as 4 points not in the same plane determine a sphere, and 3 points not in the same straight line a circle All of its plane intersections are circles all of its space intersections are spheres A hypersphere of radius R passing through our space would appear as a sphere with a radius gradually increasing from zero to R and then gradually decreasing from R to zero

Graham Denby Fitch

Lieut Col Graham Denby Fitch the winner of the Fourth Dimension Competition is a son of Henry Satterlee Fitch (captain of volunteers during the civil war, served on Gen. Sherman's staff) a grandson of Dr Graham Newell Fitch (U S Senator from Indiana colonel 46th Indiana volunteers during the civil war) and a nephew of Col Charles Denby (U S Minister Plenipotentiary to China for over twelve years) He was born in 1860 in Chicago where his father was then United States district attorney He spent nearly six years at school in Germany and France returning to the United States in 1876 President Hayes gave him an appointment to the U S Military Academy in 1878 He was graduated in 1882 among the "distinguished cadets" standing No 4 in his class. Lieut Fitch after one year's service with the Fifth Artillery at Fort Wadsworth N Y was transferred to the Corps of Engineers After completing the post graduate course at the Engineer School at Willets Point, N Y in 1885 he for the next nine years was on duty in different parts of the country as assistant to various engineer officers in charge of river and harbor improvements. In 1895 Capt Fitch was assigned to duty at Memphis in charge of Mississippi River improvements from Cairo to the mouth of White River In 1897 he was on duty again at Willets Point, N Y commanding Company C Battalion of Engineers, and as instructor of military engineering at the Engineer School During the war with Spain he served throughout the Cuban campaign, first in command of his company later as major of volunteers on Gen Lawton's staff and then in command of the Battalion of Engineers. Since the war he has been stationed in succession at St. Louis as secretary of the Missouri River Commission at Oswego in charge of the harbor improvements on Lake Ontario and at Little Rock in charge of the improvement of the Arkansas White Black, and other rivers In 1906 Major Fitch was assigned to duty at Duluth where he now is, in charge of the harbor improvements on Lake Superior He was promoted to a lieutenant-colonelcy in 1908 Col Fitch has written, aside from his official reports, a technical engineering paper on "Lock and Dam Construction on the Upper White River Arkansas" first printed by the War Department in 1904, and copied somewhat condensed in the issue of Engineering Contracting for May 6th 1908 He has translated for the Military Information Division of the General Staff various papers on military topics from the German French, and Italian Col Fitch is a member of the American Society of Civil Engineers, also of the University Club of New York city

While in our space there are but 5 regular polyhedrons (solids bounded by equal regular polygons) namely the tetrahedron cube, octahedron dodecahedron and icosahedron in hyperspace there are 6 regular hyper-solids (cells) bounded by equal regular polyhedrons. These are C^5 (bounded by 5 tetrahedrons) C^8 (by 8 cubes) C^{16} (by 16 tetrahedrons), C^{24} (by 24 octahedrons) C^{120} (by 120 dodecahedrons) and C^{600} (by 600 tetrahedrons) All of them have been exhaustively studied by mathematicians and models of their projections on our space have been constructed Of these C^8 (or the hyper-cube) is the simplest because though with more bounding solids than C^5 it is right-angled throughout, and therefore the standard form for measuring hyperspace It is generated by a cube moving in the direction perpendicular to our space for a distance equal to one of its sides. In Fig 1 where all dotted lines are supposed to be in hyperspace the initial cube is symbolically represented by $A\ B\ C\ D\ E\ F\ G\ H$ and the final cube by $A'\ B'\ C'\ D'\ E'\ F'\ G'\ H'$ the direction AA' being supposed perpendicular to our space Projecting the edges of a hypercube on our space we get a network model of which Fig 2 is a plane projection The eight bounding cubes are represented in the model by the following projections (1 2 3 4 5 6 7 8) (5 6 7 8 9 10 11 12) (9 10 11 12 13 14 15 16) (13 14 15 16, 1 2, 3 4) (1 5 9 13 2 6 10 14) (2 6 10 14 3 7 11 15), (3 7 11 15 4 8 12 16) (4 8 12 16 5 9 13 1) The form of the hypercube is conditioned by the mutual relations of these cubes that form its boundaries merely as it contains an infinite number of cubes just as a cube contains an infinite number of squares. In generating a hypercube by the motion of a cube, the latter's corners generate edges its edges generate faces (squares) and its faces generate cubes. The resulting number of elements of the hypercube is therefore as follows

	In Initial Cube.	Generated	In Final Cube.	In Hyper Cube.
Corners	8		8	16
Edges	12	8	12	32
Faces (squares)	6	12	6	24
Cubes	1	6	1	8

Each corner is common to 4 mutually perpendicular edges to 6 faces and to 4 cubes; each edge is common to 3 faces and 3 cubes; and each face is common to 2 cubes. Every cube therefore has one face in common with 6 of the 7 others. We might conceive of the hypercube as composed of cubes starting from squares parallel to the faces of the cube and of these cubes all that exist in our space are the parallel squares from which they start.

In a plane the only kind of rotation possible is that about a point, in 3-space rotation can take place about

(Concluded on page [illegible])

Fatty Lubricants

There are cases in which natural fats with or without admixture, still form the best lubricants A good lubricant for swiftly moving and lightly loaded parts of machines is made of equal weights of graphite and tallow, very thoroughly mixed An excellent lubricant for piston rods is made by melting together 40 parts of neutral wool grease and 10 parts of ceresin (a derivative of ozokerite or mineral wax) and add [illegible] to the hot mixture 25 parts of pure mineral oil and 25 parts of graphite. Good results have recently been obtained with "calypsol" which is alleged to be a [illegible] vegetable fat free from acid and of high melting point. A solid lubricant should be light colored homogeneous free from acids alkalies resins and mechanical impurities and should not contain more than 3 per cent of water or more than 10 per cent of lime soap an ingredient which is added to some of these mixtures

◆

Traube has devised a very simple process for purifying crude alcoholic spirits The process consists essentially in adding to the crude spirit a strong solution of ammonium carbonate or ammonium sulphate The mixture separates into two parts and if the temperature and the concentration of the ammonium salt are properly chosen all the impurities are accumulated in the upper portion.

THE MAGNITUDE OF THE COTTON INDUSTRY FROM COTTON BOLL TO FINISHED PRODUCT

THE COTTON INDUSTRY OF THE UNITED STATES.

The Bureau of the Census is constantly issuing bulletins which give the facts relating to various industries without waiting until the decade has been finished Thus the figures for textile manufactures are for the year 1905 The figures relating to manufactures of cotton are most interesting and we have given some of them in graphical form The annual cotton crop (year ending June 30th 190) was 13 565 88 bales representing a gross weight of 6 934 981 731 pounds Of this amount 4 304 848 903 pounds was exported In the same period only 60 508 548 pounds of cotton was imported.

The manufactured articles made in the year 1905 are shown in our comparison The area of Rhode Island is 3 872 000 000 square yards, while the woven cotton goods produced in the United States during the year was 5 070 028 520 square yards This is represented by a cotton boll reproduced in scale with the map of Rhode Island An actual cotton boll was used as the basis of the drawing The figures can be analyzed as follows

Kind	Square yards	Value
Aggregate value		$442 451 218
Woven goods total	5 070 028 520	120 382 307
Plain cloths for printing or converting total	1 818 216 172	80 311 012
Not finer than No 28 warp	812 249 764	32 945 094
Finer than No 28 warp	1 005 966,408	47 365 918
Brown or bleached sheetings and shirtings	1 172 909 182	61 254,376
Ginghams	402 310 132	22 471,867
Ticks denims and stripes	260 375 180	24 707 578
Drills	104 735 703	12 506,063
Twills and sateens	388 142 513	23 701 405
Cottonades	25 702 346	2 098 971
Napped fabrics	340 808 140	20 108 113
Fancy woven fabrics	306 254 085	28 486 342
Corduroy cotton velvet and plush	10 014 536	4 700 573
Duck total	122 001 212	17 005 082
Sail	9 588 510	1 540 745
Other	113 014 093	15 465 247
Bags and bagging	57 067 061	1 651 712
Mosquito and other netting	40 232 018	701 063
Upholstery goods, total	65 502 212	12 111 008
Tapestries (piece goods and curtains)	9 605 000	4 242 508
Lace and lace curtains	53 511 223	7 208 211
Chenille curtains	268 168	93 100
Other including covers	2 207 816	567 785
	Pounds	
Yarns for sale	464 472 753	70 885 387

Twin	6 476 573	1 282 047
Tape and webbing		49 546
Batting and wadding	10 105 850	1 173 343
Waste for sale	217 315 102	10 040 037
Other products of cotton		2 005 801
All other products		11 070 747

In our engraving the circles around the earth represent the distance covered by the different cotton goods manufactured in the United States in the year specified The quantity of some of the goods manufactured is so great that it was necessary to make the strips many yards wide

Some idea of the magnitude of the industry may be obtained when it is stated that there were in the same year 23 155 613 spindles in cotton mills

The capital of the 1 077 establishments was $605 100 164 There were 310 458 wage earners and 6 738 salaried officials clerks etc The total amount of wages paid was $94 377 696 and $9 911 767 for salaries the cost of the materials used was $281 047 648 and our table shows products worth $442 451 218 This is indeed a vast industry and one which has enabled us to successfully compete in the markets of the world

Tetanus and the Glorious Fourth.

BY JOHN B HUBER, A M M D

A wholesome tendency is now making for the elimination of such features of Independence Day as have especially endangered the lives of the young—and this while in no wise suppressive of normal enthusiasm We need not go the length of some who have rather hysterically termed this holiday the Bloody Fourth with its annual holocaust of carnage Nevertheless, it is certainly the part of wisdom and of humanity to plead for less detonating celebrations than have obtained in the past In Continental countries such occasions are commemorated quite adequately and just as heartily as with us by means of fêtes and other rational ceremonies. For adult patriotism oratorical explosions suffice, but these for reasons we need not probe are not sufficiently satisfying to the youth In the legitimate interests of boyhood some reconcilement of patriotism and prophylaxis is essential

The citizen is probably unfamiliar with the extent to which children have died from Independence Day tetanus or lockjaw than which there can be no more painful or cruel death nor is it generally realized how many other children have survived wounds received on that day without having contracted tetanus who have nevertheless been dreadfully maimed or disfigured for life It is related that these celebrations of the last six years show for the whole country a grand total of 29 296 killed and wounded The American Medical Association has taken up the matter and its Journal reports that in 1903 there were 415 cases of Fourth of July tetanus In 1904 105 cases, in 1905 104 cases In 1906 89 cases. In 1907 there were 55 recorded cases These cases were brought about in more than sixty per cent by blank cartridges in about sixteen per cent by giant fire-crackers, in about four per cent by cannon in about five per cent by firearms in about ten per cent from powder etc The decrease in casualties has thus been progressive since 1903 And Baltimore was I believe the pioneer in the agitation which is resulting so beneficently In that community there is now an ordinance providing that no person shall cast throw or fire any squib rocket cracker torpedo grenade or other combustible fireworks or explosive preparation within the city" nor may any such explosives be made in Baltimore There were in consequence but ten accidents on last Independence Day Philadelphia saturated as it nowadays is with worthy and unassailable patriotism, was able for the same day to produce a total of 482 killed and injured Denver, Detroit, Minneapolis, St. Paul, Louisville and Omaha now have ordinances similar to Baltimore s, with the result that no life was sacrificed in any of these cities. In New York, it would seem sundry among our municipal fathers (with interests on the side) have determined that the ideals upon which our republic were founded shall not die for want of fireworks for they will not endure that we shall be surpassed in patriotism

How can we prevent tetanus fatalities arising out of Fourth of July celebrations? The tetanus bacillus is anaerobic, and to this property is certainly due the comparative and the fortunate rarity of the disease—despite the fact that the bacillus is very prevalent in many localities This germ thrives only in wounds closed and thus devoid of oxygen whence the term 'anaerobic" It rarely traverses the site of an injury—rarely enters the blood and lymph channels. The toxins or poisons generated by it are the virulent factor It has its habitat mostly in earth sometimes in putrefying fluids and manure In many localities as in parts of Long Island it is ubiquitous. Tetanus is said to be curiously endemic in a region from one to five miles in extent near Atlantic City N J

The infection generally occurs through the introduction of impregnated dirt into wounds sometimes very slight wounds especially of the face hands and feet Most cases as we have noted come about through the discharge of powder in blank cartridges which consist besides the powder mainly of paper Half the remaining cases are due to the giant fire-cracker (not the small kind) The wound may serve for the introduction of germs accidentally present on the skin—a phenomenon readily understood when we consider the normal state of the average small boy s hand

There may be but a mere burn—something quite superficial yet some part of a wound however slight, may become at once impermeably sealed The bacilli may thus secure an implantation in microscopic pockets or fissures In puncture tetanus the germ may be introduced upon the instrument itself as a dirty or rusty nail or the tine of a pitchfork Blank cartridges may be made of germ harboring material Punctured contused or lacerated wounds are much more dangerous than such as are clean cut as with a dagger or a sharp knife Crushing injuries deep lacerations gunshot wounds wounds beneath the skin the fat or the fascia and especially where dirty clothing has been introduced into torn flesh are most to be feared

Obviously then the toy pistol and the giant firecracker must be forbidden children Practically no cases of tetanus have developed (at least I have not seen a report of any) from Roman candles torpedoes paper caps small fire-crackers or display pieces In order that no undue fear may arise we note that for the 89 cases of tetanus developed in 1906 there were 979 blank-cartridge wounds Thus tetanus by no means follows as a matter of course from wounds incurred on Independence Day

The symptoms of this dreadful disease may not manifest themselves until an incubation period of a fortnight has elapsed after the injury Then may appear rigidity of the neck and jaws difficulty in chewing and swallowing chills high fever asphyxia spasm of various muscles rapid pulse, profuse sweating opisthotonus—dreadful suffering

Immediately a child sustains an injury of the nature we have considered a physician is to be called who will administer an immunizing dose of tetanus antitoxin Such a timely dose will almost surely protect against the development of the symptoms but its efficacy decreases with the time lost in administering it Before the use of this serum, death followed in at least 80 per cent of tetanus cases. All health departments now have this antitoxin available for immediate use upon application The Health Department at Albany has advised the health officers throughout New York State to apply to it for supplies in order that they may be prepared to provide local practitioners without delay Its Bulletin states 'An immunizing dose of antitoxin is an almost certain means of preventing tetanus infection and intoxication, so far as we know, no case of lockjaw has developed in this country among those who have received an immunizing dose of this serum" In any event the secretion of the wound may during the incubation period be scrutinized by the microscopist for the possible presence of the tetanus bacillus its absence after several examinations should greatly allay fear of the disease.

Retirement of Secretary Wilson.

James Wilson Secretary of Agriculture will retire from office in December, and will probably be succeeded by Charles F Scott at present Representative in Congress from the Second District of Kansas and chairman of the House Committee on Agriculture.

Mr Wilson has realized his ambition of serving in the Cabinet for a longer continuous term than any other man He entered the Cabinet in President McKinley's first term He is now nearly seventy-four years of age. To him are due many important improvements in the administration of the Department of Agriculture, and likewise many new lines of research, the results of which have aided farmers throughout the country

◆

The Death of Egbert P. Watson.

Mr Egbert P Watson, formerly a member of the editorial staff of the Scientific American, died at Elizabeth, N J, at the age of seventy four, on June 22nd, 1909 In his professional career as an editor and an engineer, Mr Watson displayed a wide engineering knowledge and keen editorial judgment. After he severed his connection with this paper he founded a periodical of his own called The Mechanical Engineer, and continued its publication for sixteen years.

Mr Watson was an engineer of the old school, that is, his engineering knowledge was acquired mostly by hard work in the shop, although he was an omnivorous reader and well versed in engineering literature Long after he severed his connection with this journal he continued to contribute to its columns occasional engineering articles which were distinguished by the sound and practical information that they conveyed Mr Watson always took pride in the fact that he drove the first bolt in the "Monitor" the civil war ironclad He was a past vice-president of the National Association of Marine Engineers, and was for many years a member of the Marine Engineers' and Architects' Association

◆

Death of Orrin S Wood.

Mr Orrin S Wood, well known in this country as a pioneer telegraph engineer died at Turner, N Y., on June 22nd 1909 at the advanced age of 91 years. Mr Wood had the distinction of superintending the construction of the first telegraph line between New York and Philadelphia in 1845 and of opening the first telegraph office in New York city at Hanover Street and Exchange Place His interest in telegraphy antedates these achievements, however, for in 1844 he became an operator on the original telegraph line between Baltimore and Washington after having studied telegraphy under S F B Morse himself Mr Wood helped to build the Albany Buffalo line and the telegraph line connecting Buffalo, Niagara Falls, Toronto, Montreal and Quebec, besides constructing a telegraph system northwest of Chicago, which now forms part of the Western Union lines.

$100 Prize for a Fire Escape.

At the National Industrial Exposition to be held in Toronto Canada, from August 28th to September 14th fire escapes are to be exhibited under the auspices of the Commercial Traders Association of Canada The association will give a prize of One Hundred Dollars to the inventor of the best fire escape The selection will be made by the Ontario government and in all probability the successful fire escape will be placed in many hotels in the Province of Ontario The conditions of the contest may be obtained by addressing the Commercial Traders' Association of Canada, Toronto Canada.

◆

The Current Supplement.

The wonderful results obtained by the great masters of the art of piano playing can also be obtained to a certain extent by mechanical means in the modern piano player Mr John F Kelly describes in the current Supplement No 1748 the construction of these piano players and shows how they have evolved from crude forms. Mr John A Mathews's paper on the new automobile steels is concluded Among the numerous fads and fancies of the house furnisher of to-day none is more quaint and interesting than the decorative use of the vari-colored bottles and flasks of many shapes and sizes that are relics of one of the oldest enterprises of this country Ada Walker Camehl writes interestingly on this subject, and illustrates her article with pictures of curious bottles. The manufacture of nitrates from the atmosphere by means of the Birkeland Eyde process is set forth by Sam Eyde What a very small telescope will do is excellently described by Arthur Mee Prof C Doelter writes on the influence of radium and ultra violet rays upon the color of minerals. F Hartmann contributes a good technological article on gilding

◆

During Mr Andrew Carnegie's recent visit to Paris he was given an official reception at the University It will be remembered that Mr Carnegie donated a considerable sum to this institution so as to enable it to found a special laboratory for researches upon radium, to be carried on by Mme. Curie. During the reception Mr Carnegie was presented with a medal commemorating his generosity to the University. In a conversation with President Fallières, he made known his intention of establishing an institution such as exists in America and England for rewarding heroic actions, and proposes to donate a million dollars for this purpose.

THE "MICHIGAN"—OUR FIRST "DREADNOUGHT"

The first "Dreadnought" to be completed for the United States navy is the "Michigan," which, with her sister, the "South Carolina," was authorized by Congress March 3rd, 1905 In the act of authorization the displacement of these ships was placed at 16 000 tons, which is that of the Connecticut" and 'Kansas" class. It was intended to provide these vessels with the same armor and armament as the ships of those classes but before the construction was far advanced, it was decided to give them as much as possible of the 'Dreadnought" characteristics and the plans were changed accordingly

The "Michigan," which was built by the New York Ship Building Company, Camden, N J was recently taken to the government course at Rockland, M for her standardization trials, and on June 9th during five runs at maximum speed she averaged just under 19 knots per hour, or to be exact 18 976 knots On the fastest run over the measured mile she reached a speed of 20 01 knots

The accompanying photograph was taken of this fine vessel when she was running at a speed of over 19 knots and it serves to show very clearly the special characteristics of the ship notably her two lattice-work fire-control masts and her main battery of eight 12 inch guns carried in four turrets.

The 'Michigan' is a 'Dreadnought in everything except size and speed the displacement being from 3,000 to 4,000 tons less than that of the typical 'Dreadnought" of to-day and her speed about two knots less In respect of protection and armament, however, she is fully qualified to lie in line of battle with the heaviest ships of the "Dreadnought' type Although she carries but eight 12 inch guns as against ten carried by the British ships, the position of her turrets all of which are on the center line, enables her to deliver the same weight of fire on either broadside namely eight 12 inch guns. Speaking of the penalties paid by the 'Michigan' on account of her small displacement it should be mentioned that it was necessary to cut down her freeboard aft and lower the after two turrets eight feet below the positions at which they are carried on our later "Dreadnoughts" of larger displacement.

The "Michigan" is 450 feet long between perpendiculars, 452 feet 9 inches over all 80 feet 2½ inches in breadth at the water line, and on a mean draft of 24 feet 6 inches has a displacement of 16 000 tons Her full load displacement is 17 617 tons. The speed called for by the contract is 18 5 knots which as we have seen above, was exceeded She is driven by twin screw, reciprocating engines of 16,500 horse-power and she has a maximum bunker capacity of 2,300 tons

The armament consists of eight 45-caliber 12-inch guns mounted in four turrets. The foremost pair are 25½ feet above the water. Back of these are two guns in a single turret, which fire above the roof of the forward turret and are carried at a height of 33½ feet above the water The superstructure occupies about one-third of the vessel's length amidship. It contains the conning tower and two smokestacks, the two military masts and two boat derricks, placed abreast of the smokestacks Within the superstructure and carried on the spar deck is a battery of ten 3 inch guns for torpedo defense and twelve other 3 inch pieces are mounted on the superstructure bridges and elsewhere on points of vantage throughout the ship

Abaft of the superstructure are the remaining two 12-inch gun turrets one mounted on the main deck at a command of about 17½ feet above the sea and ahead of this another turret with its guns carrying at a height of 25½ feet above the water This disposition of main armament gives a broadside of eight 12 inch and a fore and aft fire of four 12 inch

The armor plan of the Michigan shows a water line belt 8 feet wide tapering amidships from 11 inches in thickness at the top to 9 inches at the bottom The belt reduces gradually to a thickness of 4 inches at the ends of the ship Above the main belt and extending from the forward to the after barbette is another belt of armor 10 inches thick at its lower edge 8 inches thick at its upper edge and 8 feet in width The barbettes for the 12 inch turrets are from 10 to 8 inches in thickness The turrets themselves have 12 inches of armor on the sloping port plate and 8 inches on the sides and at the back. The protective deck is 1½ inches in thickness amidship and forward and 3 inches in thickness in its after portion The big guns are manipulated by electric power as are also the ammunition hoists The torpedo equipment consists of two submerged torpedo tubes for the discharge of the new 21 inch turbine driven torpedo

At the present time we have completed or under construction for the United States navy eight Dreadnoughts' The Michigan and South Carolina of 16 000 tons carrying eight 12 inch guns the Delaware' and North Dakota of 20 000 tons carrying ten 12 inch guns the Florida and Utah ' of 21 825 tons mounting ten 12 inch guns and the Wyoming and 'Oklahoma of 26 000 tons each mounting twelve 12 inch guns

◆

A Dirigible Balloon Made in Sections.

A German engineer named Weissenburger has constructed a model of a dirigible balloon which can easily be taken apart for transportation This possibility is of great value as often the transportation of the balloon is made necessary by a premature landing or other cause The model which is about 13 feet long consists of eight sections each of which is in the form of a cylinder with hemispherical ends, and can be collapsed like an umbrella by turning a handle. The convexities of both ends of the section are directed forward, so that when the sections are put together the rear end of one closely embraces the forward end of the next The sections are made entirely alike, so that a damaged section can be replaced by a reserve section Each section possesses its independent gas bag, air ballonet, frame, and points of attachment to the car and steering apparatus, and each section can be used as a small captive balloon for military purposes It is also possible to transform a section quickly into a small dirigible by installing a little motor in its car For this purpose the section is provided with a blower for distending the ballonet and with vertical and horizontal rudders Two sections without frames may be combined to form a larger non rigid airship The car of the entire airship contains as many sections as the balloon so that each partial balloon possesses its own car with the exception that a special division of the car is reserved for the machinery In the estimation of the inventor the sections can be put together by a balloon corps in two hours

◆

Saponification and Pancreatic Juice

In making soap and candles the natural fats are saponified or resolved into their component parts fatty acids and glycerin by various methods including the action of alkalies lime sulphuric acid superheated steam etc

Haller has devised a method of effecting saponification by means of methyl or ethyl alcohol and Connstein and Nicloux have suggested a biological method based on the employment of a diastase which occurs in castor oil beans

Baur has recently proposed the use of the pancreas of animals which contains a soluble ferment capable of resolving fat into fatty acid and glycerin in from one to four days This method has been successfully tested with beef suet and with cocoanut, cotton-seed, maize and palm oils This process if universally adopted in all countries would require 12 000 tons of pancreas annually The abattoirs of the world furnish about two-thirds of this quantity or 8 400 tons In comparison with the employment of the castor bean ferment the pancreatic method effects a more complete saponification which compensates for its greater cost

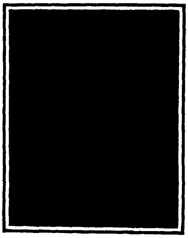
◆

The annual summary of shipbuilding just issued by Lloyd's Register shows that the total output of the world during 1908 (exclusive of warships) appears to have been 1 833 286 tons (1 706 179 steam 127 107 sail) According to the latest returns received by Lloyd's Register the tonnage of all nationalities totally lost broken up etc during the twelve months amounts to about 794 000 tons (557 000 steam 237 000 sail) The net increase of the world's mercantile tonnage at the end of 1908 is thus about 1 039 000 tons Sailing tonnage has been reduced by 110 000 tons while steam tonnage has increased by 1 149 000 tons Of the tonnage launched during 1908 the United Kingdom has acquired over 30½ per cent Of the total merchant tonnage output of the world during 1908 50¾ per cent was launched in the United Kingdom but if only sea going steel steamers of 3 000 tons gross and upward be taken into account thus excluding vessels trading on the North American Lakes—out of the total of 1,1 such steamers of 1 050 741 tons launched in the world over 63 1 3 per cent of the tonnage was launched in the United Kingdom

A MUSEUM TO ILLUSTRATE THE DEVELOPMENT OF MATHEMATICS

BY HERBERT T. WADE

As an interesting and important part of the study of the history of mathematics it is essential to consider the various means that have been employed in the application of this science to every day life. From the times of Babylon to the present day there has been an interesting succession of ingenious and useful devices and instruments of a very practical nature which when considered together are remarkably striking in illustrating the development of what is usually regarded only as a most abstract science. Such a collection has been assembled by Prof. David Eugene Smith of Teachers College, Columbia University, and recently it has been on exhibition in the Educational Museum of that institution. Containing as it does many objects of great interest to the archæologist, metrologist, surveyor and engineer, yet it is in its relation to the historical development of the science of mathematics and its great influence in bringing out this development to the student that the exhibition possesses its highest value. With this end in view Prof. Smith has accumulated a collection of mathematical instruments, weights and measures, sun dials and other devices for time measure, mathematical manuscripts, early printed works, an extensive collection of portraits and autographs of prominent mathematicians and curios gathered from many corners of the world, some of the most interesting and significant of which have been specially photographed for the SCIENTIFIC AMERICAN.



A mediæval astronomer using an astrolabe

Reproduction of a painting from a 15th century work

Astrolabes made by Bernardinus Sabeus of Padua (Italy) 1558 and by an unknown Italian craftsman between 1450 and 1525

One of the most important and fundamental applications of mathematics has been to surveying and astronomy, and just as soon as trigonometry was developed to a point where it was available for practical use there was need of instruments for the measurement of angles and for realizing or imitating the relative movements of the celestial bodies. Now for measuring angles in the early times a device known as a cross staff was used, where a movable transverse piece could be adjusted along the length of a wooden staff so that by sighting from one of its extremities over the end of the cross piece and then laying off the angle thus formed by the line of sight with the staff itself, a rough angular measurement could be made. Various improvements gave the [illegible] staff and the back staff, but the first really serviceable instrument was the quadrant, which was the ancestor of our modern and indispensable sextant. A good specimen of a quadrant of Tyrolean workmanship, and dating back to about 1600, is contained in the collection and is here illustrated. The alidade or movable bar carries two small transverse pieces pierced with sight holes, and is so pivoted that it can be moved over the graduated quarter of a circle, which gives to the instrument its name. The quadrant could be used for measuring both vertical and horizontal angles and naturally lent itself to determining the elevation of the heavenly bodies in astronomy and navigation, so that by the middle of the sixteenth century it was accepted as a necessary nautical instrument as well as used on land wherever trigonometry was applied to surveying. The Italian textbook "L'Uso della Squadra Mobile Opera di Ottavio Fulli. In Trento MDCCLII," a page of which is shown in the illustration, gives the actual directions for the use of the quadrant in measuring the height of the tower by the familiar trigonometrical principles involving the measurement of linear distances, here by pacing, and the determination of angles.

Quadrant of Tyrolean workmanship dating from about 1600

It was the common trigonometric instrument of mediæval times and its use is shown in the accompanying illustration

Using the quadrant to measure the altitude of an inaccessible tower

Reproduction of a plate from an 18th century treatise on the quadrant.

Practically contemporary with the quadrant was the astrolabe, where the entire circle was employed, and where by the use of an alidade and a divided circle or limb the angular distance between two stars could be determined, leading to the deduction of the motions of the planets by the astronomers and astrologers of the middle ages. The use of the instrument is indicated by the accompanying reproduction of a page from an eighteenth century scientific treatise, while

A MUSEUM TO ILLUSTRATE THE DEVELOPMENT OF MATHEMATICS.

A HUGE FILTERED WATER RESERVOIR FOR LONDON

BY THE LONDON CORRESPONDENT OF THE SCIENTIFIC AMERICAN

The maintenance of an adequate water supply for the constantly expanding English metropolis is a problem of supreme importance and one of no little difficulty. The main sources of supply are the River Thames at a point well above tidewater, the river Lea, and wells sunk into the solid chalk. Recently the facilities for supplying water have been appreciably improved by the erection at Honor Oak in the southeastern suburban area, of a huge covered in reservoir, the largest of its type in the world for storing filtered water, the capacity of which when full is 58,000 000 gallons.

The necessity of a new reservoir was recognised as far back as the early nineties. Not until 1898 was work begun by the local water supply company. In that year a large brick making plant was erected on soil eminently suited to brick making. The result of this development was rendered obvious during actual constructional work since the brick material was available on the spot and delays as well as cost of transport were avoided. The saving thus effected may be readily realised when it is considered that upward of 16 000 000 bricks were utilised in the building of the reservoir. At the same time the brick plant offered an economical solution of the problem of disposing of the greater part of the excavated material for the foundation of the reservoir etc which material aggregated 173 000 cubic yards.

After all the water-supply companies of London were subsequently consolidated into the Metropolitan Water Board the undertaking was rapidly completed. The undertaking was designed and carried out under the supervision of Mr J W Restler M.Inst C E the deputy engineer in-chief of the Metropolitan Water Board to whose courtesy we are indebted for the accompanying illustrations and for much information.

Interior, showing principle of dividing the reservoir into bays 21½ feet square

It is the primary purpose of this reservoir to maintain a low pressure supply throughout the metropolitan area on the southeastern side of the Thames. But if occasion should demand it can be dispatched by means of mains under the river to the northern territory. The maximum water level of the reservoir is approximately 144 feet above ordnance datum. The depth of water throughout the greater part of the structure is about 21½ feet but in a part of the north eastern section it reaches a depth of 34 feet.

The reservoir is divided at right angles into four sections each of which is independent of the others so that any one may be emptied when desired for cleaning without interfering with the service suitable appliances being provided for diverting the water from the supply main into one or other sections. The building is erected on a natural clay formation the flooring being of solid concrete forming inverted arches crossing one another at right angles. From the apex of each groining spring piers of solid brick work of cruciform section to carry a brick roof comprising a series of segmental arches running parallel the whole length of the structure with segmental jack arches at right angles carried from pier to pier throughout the series. The reservoir is therefore divided into a series of cells 21 feet 6 inches square from center to center of the brick piers the thickness of the brickwork of the latter being 18 inches with a width across of 4½ feet. Down the centers of the inverted arched floor extend drainage channels communicating in a well near the intersection of the reservoir into the four sections while at the actual point of intersection of the division walls is a circular valve chamber 24 feet in diameter extending from the bottom to the roof of the building and into which lead the mains for supply intercommunication with the four sections and draw off these pipes being of 42 inches diameter and fitted with 36 inch valves operated from a valve house above.

In addition to the brickwork for the arched roofing there is a 6 inch outer covering of concrete finished with clean cement upon which is distributed a thick layer of clay and 6 inches of mold originally cleared from the site so as to present a flat level top surface. At frequent intervals 6 inch air pipes are distributed over the bays for ventilation and admission and escape of air during the respective processes of emptying and filling the reservoir.

The two division walls which run at right angles and divide the reservoir into four sections are cambered back to back with the intervening space filled with concrete. The outer walls are of concrete with brick lining ample precautions having been taken to bond the two thoroughly together. The thickness of the retaining walls varies from 16 feet to [illegible] feet at the base and each bay is provided with a buttress reaching in most cases to the first pier. In those places where the pressure is the greatest the buttresses for the retaining wall are carried back to the fourth bay from its face. Around the outside of these retaining walls a puddled clay wall 3 feet thick is provided the puddle being taken well down into the London clay and rendered thoroughly water tight by careful tamping. This wall is carried up to and connected with the layer of clay extending over the entire roof of the structure. On the northern and parts of the eastern and western portions where the top of the reservoir projects above the natural surface of the ground an earthen embankment is provided which embankment is composed of alternate layers of [illegible] and burnt ballast of [illegible] and 4 inches thickness respectively and with a slope ranging from 2 to 3 to 1.

The reservoir measures 8 4 feet in length between the walls and has a maximum width of 87 feet. The total area covered approximates 14¾ acres the actual water area being a little over 10 acres. The supply is drawn from the 42 inch main which brings the filtered water from the pumping station at Hampton some 17 miles distant. The outlet pipe is of the same diameter. The supply can be augmented from a deep well pumping station which has been erected on the site and from which a large quantity of water can be drawn. This well has a diameter of 11 feet and is sunk for a depth of 300 feet the lower half of which is through chalk. Headings have been driven into the latter in all directions to a total length of 3 400 feet. The water is raised by two sets of three-crank vertical triple-expansion engines coupled to deep well pumps having cylinders of 18 inches bore by a stroke of [illegible] feet. The water thus obtained in addition to being discharged into the adjacent reservoir can be delivered into mains feeding two other reservoirs in the vicinity. The total cost of the enterprise has been $1 200 000.

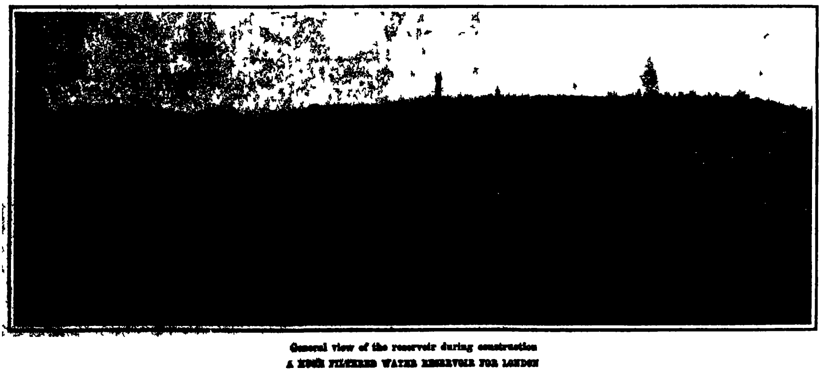
Another Substitute for India Rubber.

A G Inrig has patented in Great Britain and Germany a new process for making a substitute for India rubber. The materials used are animal refuse capable of yielding gelatin, oils, sulphur, bromates and sodium stannate the addition of the last named salt being the distinguishing feature of the process. The proportions recommended are animal refuse 100 parts water [illegible]0 parts oil 20 to 60 parts. These ingredients are stirred together for about an hour and then 1 per cent of potassium bichromate and 1 per cent of sodium stannate are added. The mixture is then heated to about 1[illegible] deg [illegible] and kept at this temperature about [illegible] minutes or until the previously liquid mass becomes pasty in which condition it is poured into molds. A harder and tougher mass is made by adding [illegible]0 per cent of oil 1 per cent of sodium stannate 1 per cent of potassium bichromate and [illegible] 10 per cent of sulphur and heating the mixture to 2[illegible] deg [illegible]



General view of the reservoir during construction

A HUGE FILTERED WATER RESERVOIR FOR LONDON

THE HEAVENS IN JULY.

BY HENRY NORRIS RUSSELL, PH.D.

Hercules, which is the constellation represented in the initial of this sentence, while not as brilliant as some others, is one of the most characteristic figures in the summer sky Its most distinctive configuration is a quadrilateral of third magnitude stars shaped like the keystone of an arch which at our hour of observation is almost exactly overhead, and which can always be easily found since it lies about one-third of the way from Vega toward Arcturus. The rest of the constellation can be easily made out with the aid of the map Several of its individual stars are noteworthy The star α in the hero's head, is one of the reddest of the brighter stars, and shows an especially fine banded spectrum—an evidence of relatively low temperature, and like many such stars, varies irregularly in brightness. It is also double having a green companion, visible with a small telescope ζ is also a fine double, having a companion about 1/20 of its own brightness, which revolves about it in a period of 34 years. When the two are closest, they can hardly be separated by the greatest telescopes but when they are farthest apart (as is nearly the case at present) the comparison can be seen with telescopes of moderate aperture though still too difficult for small ones of three inches or less.

Another interesting system is μ which has a faint companion 30 sec distant which shares in the large proper motion of its primary and is itself double, with a period of about 45 years

Both these last two systems are tolerably near us their distances being about 20 and 30 light years according to the best determinations

Still more interesting to the telescopic observer is the great star cluster (one of the finest in the heavens) which lies almost exactly on the western edge of the "keystone between the stars ζ and η it is clearly visible in a field glass as a spot of light with two small stars near it, but it requires much greater instrumental power to show the individual stars of which the cluster is composed

There are thousands of them, scattered near the edges but condensed to an almost continuous blaze of light at the center—a very impressive spectacle

With an instrument which is not powerful enough to show the separate stars, the cluster is still easily visible and looks nebulous, i e, hazy and without sharp boundaries If it were removed to a dozen times its present distance, it would present this appearance in our largest telescopes.

It is therefore natural to ask, Are not the numerous nebulæ of all sizes and shapes, which can be seen, or better photographed, in all parts of the sky, simply star clusters so distant that the separate stars cannot be seen?

For an answer to this, we must appeal to that clue to many a riddle of the universe, the spectroscope

It is well known that a spectrum showing bright lines is due to glowing gas, while a bright spectrum crossed by dark lines is given by a glowing opaque body surrounded by a gaseous atmosphere—in other words, a star

Now the nebulæ may be divided into two classes. Some, like the great nebula of Orion, are conspicuously green in color, others, like that in Andromeda, are white Those of the former class show a spectrum of bright lines, which proves that they are composed, or rather that the luminous part of them consists of, certain gases—hydrogen, helium, and others not yet identified. This has been known for forty years. But the white nebulæ, among which are to be counted all those remarkable objects, the spiral nebulæ, have till very recently defied investigation. They are so faint that nothing can be done with them visually, and photography demands very long exposures. One or two fairly successful plates, obtained by different observers, showed a continuous spectrum crossed by traces of dark lines, but the matter was still rather uncertain till the publication of some results recently obtained at the *Lick Observatory* by Mr. Fath. Using a specially designed instrument and very long exposures (continued for several successive nights) he has obtained photographs of the spectra of a number of white nebulæ, which are of the highest interest. The results of the earlier observers are confirmed and extended The great nebula of Andromeda, for example, shows a spectrum crossed by dark lines, such as would be given by a cluster of stars most of which were like the sun. Others show lines more like those in the spectrum of Sirius, and others a combination of dark and bright lines, as if they were composed both of stars and of luminous gas.

A number of star clusters, photographed for a test, showed clearly the dark line spectrum predicted by theory It seems therefore probable that these white nebulæ are really star clusters of immense size at enormous distances. It will not do to speak too positively, for a determination of the parallax of the Andromeda nebula by Bohlin places it quite near us, at a distance less than twenty light years—in which case the component "stars" would have to be mere specks like the asteroids in order not to be directly visible It is possible that this nebula may be an ordinary star like the sun, surrounded by foggy matter of some sort which obscures its direct rays, but is itself visible by reflected light, but further investigation is necessary before this question can be settled

However, it seems almost certain that the Milky Way viewed obliquely from a distance of thirty times its own diameter, would appear as a large oval, and probably spiral, nebula, giving a dark-line spectrum. And it is certainly open, to anyone who chooses, to believe that the Andromeda nebula, or others of the sort, are themselves distant galaxies comparable perhaps to our own, whose countless millions of stars betray themselves to our telescopes, even as those of the Milky Way do to our unaided eyes, merely as a spot of light in the sky.

NIGHT SKY: JUNE AND JULY

THE HEAVENS.

South of Hercules is another large constellation, Ophiuchus, represented as a giant carrying a serpent (Serpens). The star α Ophiuchi, which marks his head, is close to α Herculis. His feet are far to the southward, near Scorpio and Sagittarius, both of which are well seen near the southern horizon.

Spica is at a moderate height in the southwest, and Arcturus almost above it. Leo, which contains the bright star Regulus and the far brighter planet Jupiter, is low in the west. Of the remaining zodiacal constellations, Libra is marked by a rather conspicuous pair of stars half way between Spica and Antares, and Capricornus and Aquarius are rising.

The two bright stars in the Milky Way, to the east, are Altair in Aquila and (on the left) Deneb in Cygnus. The still brighter star higher up is Vega, in Lyra.

Ursa Minor and Draco are high up above the pole. Ursa Major is descending in the northwest, and Cepheus and Cassiopeia coming up in the northeast

THE PLANETS.

Mercury is morning star all through the month, and is well observable during the first half of it. He is at his greatest elongation on the 7th, and rises about 3 40 A. M At this time he is on the borders of Taurus and Gemini some distance from any bright star, and so should be easily recognized.

Venus is evening star in Cancer and Leo, setting about 8 40 P M, in the middle of the month On the evening of the 27th she is very near Regulus.

Mars is in Pisces, and rises about 10 P M, in the middle of the month. By its close he is within 50 million miles of the earth and very bright.

Jupiter is evening star in Leo, setting about 10 P M toward the middle of the month

Saturn is in Pisces, east of Mars. He is in quadrature with the sun on the 15th, and is due south at 6 A M

Uranus is in opposition on the 11th. At this time he is in R. A. 19h 23m 5s., declination 22 deg 33 min. south—which places him in Sagittarius, about two-fifths of the way from the bowl of the Milk Dipper toward α and β Capricorni and far from any convenient reference stars for the naked eye. By making a diagram of the stars in this region, with the aid of a field glass, he can be identified by his motion, which is 10s. of R. A. to the west, and 20s. of declination southward, per day

Neptune is in conjunction with the sun on the 9th, and is invisible all through the month.

THE MOON

The moon is full at 7 A. M on the 3rd, in her last quarter at 2 A. M. on the 10th, new at 6 A. M. on the 17th, and in her first quarter at 7 A. M. on the 25th. She is nearest the earth on the 9th, and remotest on the 23rd She is in conjunction with Uranus on the 3rd, Mars on the 8th, Saturn on the 10th, Mercury on the 15th, Neptune on the 16th, Venus on the 19th, Jupiter on the 20th, and Uranus again on the 31st.

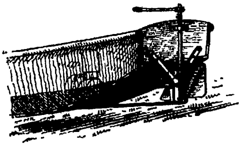
The *Artocarpus integrifolia*, bread-fruit, or Jack-tree growing wild in Java, gave its name to the locality, *Nangko Djadjar* (*Nangko* = bread-fruit tree, *Djadjar* = alley or avenue.) The height of the trunk is about 50 feet. The tree is very straight. This plant is not to be confounded with the other bread-fruit (*A. incisa*) which has the leaves [illegible]; *A. integrifolia* has them entire. The fruits are [illegible] inches long and 12 inches broad; the weight is [illegible] pounds. The flesh of these fruits is [illegible]. The oily seeds are eaten, roasted. The wood is a beautiful yellow in color [illegible] work [illegible]. When struck, the wood [illegible]. Hence bells are made of it, and pieces of the wood are also used by the [illegible] for giving signals. The [illegible]

Handy Man's Workshop

TO INSTALL A MOTOR IN A SMALL BOAT

BY MORRIS RADER

Small marine engines can be bought so reasonably now, that many owners of small craft, skiffs, and canoes would install an engine were it not for the trouble and expense of putting on a skag and shaft log. An easy way to overcome this difficulty is shown in the diagram It has been tried by the writer and is a success.



SHAFT BEARING FOR A SMALL BOAT

A shaft bearing is made of iron in the form of a Y, and fastened to the stern of the boat to support the shaft. A longer piece is fastened to this and to the bottom of the boat to protect the propeller A projection of this in the rear will carry the rudder A small shaft log is fitted inside the boat, with the stuffing box on the inside, which can easily be packed from the inside without removing the boat from the water

* * *

HANDY MAN'S SURVEYING INSTRUMENT

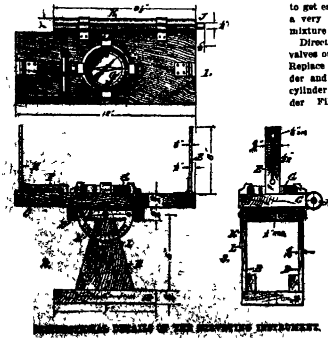
BY AUGUST MERICKER

While the surveying instrument of which a description follows is not very accurate, still if proper care be taken in its construction it will be accurate enough for all ordinary purposes

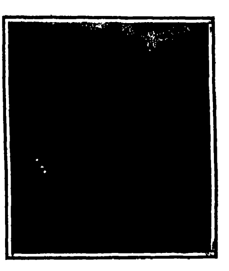
It is built as follows To the base, *A*, of ⅝ inch pine secure the uprights *B*, *B*, of 5/16-inch pine The body, *C*, of ½-inch pine, is hinged to the uprights by a ¼ inch brass rod which passes through a block, *D*, secured to the underside of the board *C* On the body *C* are mounted the two sights *E E* They are made of brass and are hinged so that they can be folded down out of the way when the instrument is being carried The sights must be mounted on the center line of the body Two spirit levels *F* are mounted on the body *C* at right angles to each other The compass *G* is fastened directly over the center of the instrument with four wooden fasteners The position of the N, S, E, and W points can be seen on the drawing

The "telescope," *H*, is mounted on the side of the base and is held in place by the two brass bands. It is made of 1 inch tubing with a ¼ inch piece of brass tubing *J*, fitted in one end for the eyepiece At the other end are two cross hairs. This is used for leveling. The protractor *K* is fastened to the block *D* and is used to measure vertical angles. As the body is moved the protractor turns past the pointer *L* and the number of degrees in the arc it turns can be easily read The instrument is put together with brass screws.

A tripod can be readily made out of three 1¼ inch poles about 4½ feet long, hinged to a top The instrument is fastened to the tripod with a ¼ inch bolt.



[illegible] DETAILS OF THE SURVEYING INSTRUMENT.



THE SURVEYING INSTRUMENT IN USE.

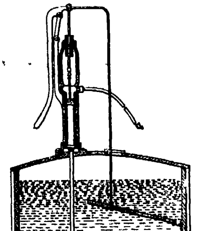
The instrument cost the writer about $2 50 and up to the present has paid for itself several times on small jobs

* * *

A HOME-MADE SPRAY OUTFIT

BY CHARLES A UNGERLIE

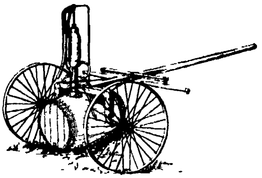
The spray pump described below cost me $11 One of standard make and not so powerful was priced at $45 Any ordinary workman who is handy with tools could put my sprayer together in a day It has proven so valuable to me that I wish to make it known to everybody It was assembled from the following A riding cultivator frame pole and wheels (old scrap iron) a good coal-oil barrel (price $1) a 3 inch cylinder cast iron force pump ($6), a plain brass 2 inch cylinder and valves ($2) a piece of good ⅜ inch hose and a spraying nozzle ($2) Total cost, $11 After putting the above material together I was able to get easily a pressure of 150 pounds per square inch, a very necessary prerequisite to apply the Bordeaux mixture with the right force



SECTION SHOWING ARRANGEMENT OF AGITATOR.

Directions for assembling are as follows Take the valves out of the cylinder of any cast iron force pump Replace these valves with the plain brass 2-inch cylinder and valves Cut off with a hack saw the 3 inch cylinder to the right length to just fill the cast cylinder Fill in the space between cast cylinder and brass cylinder with plaster or cement, being sure that the brass cylinder is in the exact center of the cast cylinder Attach the plunger valve of brass cylinder to the plunger piston of the force pump and couple up the piston to the handle of the pump so as to get a full stroke. As only a small amount of liquid is needed in spraying the object of this reduction of cylinder is to lessen the flow and increase the pressure. The reduction of 3 to 2 halves the flow and doubles the pressure. Mount the pump on the barrel and the barrel on the riding cultivator frame. Make an agitator as follows In the barrel, near the bottom on the end or head of the same, hang with a T-hinge a board made of oak 1 x 6 x 2 feet to swing up and down. Connect the board with the pump plunger by a steel rod so that it will swing up and down with the stroke. The steel rod should enter the barrel through an opening made to pour in the liquid.

I use this machine to spray my hen house with lime and coal oil at the rate of 100 square feet per minute It makes a good job at whitewashing as well and is death to bugs and microbes on my fruit trees.



THE HOME MADE SPRAYER COMPLETE

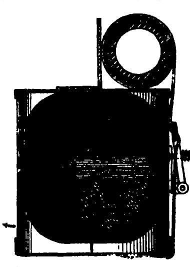
HOW TO MEND GARDEN HOSE.

BY J A SENGSTROM

As the garden hose gets a little old and begins to swell it soon gets out of commission altogether if not attended to.

A simple way to mend it is to wrap the hose with ordinary twine which will make it last a few more seasons As it is no easy matter to wind this cord by hand and get it even and under uniform tension, the writer has for many years used the simple contrivance shown in the accompanying illustration

It consists of an ordinary tin can with a lid into which is put the ball of twine In the center of the bottom make a small hole, through which pass the loose end of the cord Thence let it run down the side of the can through a tension device and to the hose To the cover of the can is soldered a small piece of tin bent to a right angle and forming a guide for the hose. The tension device consists of a short piece of metal with its upper end bent outward forming a fulcrum for a short spring-compressed lever The latter at its lower end has a small hole therein through which the cord is passed A short stove bolt serves to regulate the tension on the lever It will be observed that the cord is pressed against the can by the lever The whole device is now soldered to the tin can



DEVICE FOR WRAPPING GARDEN HOSE

In use the can is turned around the hose, and with the tension properly adjusted the twine will wind around the hose very closely and it will feed the can forward automatically It will make the hose slightly smaller and thus close all the small punctures, through which the water percolates, between the several layers of the canvas By giving the cord a coat or two of some waterproofing it will be found that the hose will last as long again besides it will stand a great deal more pressure than before

* * *

A GOOD SUBSTITUTE FOR LEATHER BELTING

An excellent substitute for leather belting can be made from a piece of ordinary fire hose splitting it up the middle into two parts, i e two belts can be made from one piece of hose The writer has seen this done on more than one occasion with perfect satisfaction

* * *

According to a contemporary the largest transmission line in the world is that of the Niagara Syracuse-Auburn line, which transmits 30 000 horse-power over a distance of 163 miles The line in parts is designed to carry 60,000 horse-power

RECENTLY PATENTED INVENTIONS.

Pertaining to Apparel.

SEPARABLE BUTTON.—E. C. KAAG, New York, N. Y. The aim of this invention is to provide a separable button for use on cuffs, collars, garments, and other articles, and arranged to permit convenient separation of the members and easy assembling thereof to unite the members, without danger of accidental disengagement when the button is in use.

OVERALLS.—W. F. HARBOUR and G. A. KELLOGG, Atlanta, Ga. The object of this invention is to provide simple, inexpensive and easily manufactured overalls, having aprons which can be positioned within the overalls so that the latter become similar to ordinary trousers, and in which the apron can be operatively positioned and attached to the suspenders.

HAIR ORNAMENT.—A. HOCHHEIMER, New York, N. Y. In this instance the invention is an improvement in ornaments for use for the hair, and has in view a device capable of supporting a number of feathers or plumes, and which may be easily applied and secured to the hair at various points and readily detached.

NECKTIE HOLDER.—W. DOWNING, Pawling, N. Y. The improvement has reference to necktie holders provided with a cross bar adapted to be passed through the body of a tie, after the latter has been tied in the preferred form on some suitable object, such as a pencil, a stick of wood, or the like, and after the latter has been withdrawn.

LIFE-BELT.—D. BOOWMAN, Bussum, Netherlands. The invention relates to life belts, the more particular improvement consisting in providing such belts with air compartments adapted to collapse or fold and to normally remain folded, but ready to be spread or inflated at a moment's notice when the belt is to be used.

METHOD OF FORMING TIPS OF SHOE-LACES.—MARY A. BAKKEIN, Watchung, N. J. The object of this invention is to provide a new and improved method for forming tips of shoe laces, in a very simple and economical manner and with a view to render the tip permanent without the use of metallic stiffening, and to allow of giving the tip the same color as that of the body of the shoe lace.

Electrical Devices.

RECEIVER FOR WIRELESS SIGNALING.—H. C. CATLEY, Riverside, Cal. The invention provides an improved wave detector, makes the detector self-registering and self-adjusting within certain limits, provides a number of hand-operated adjustments for increasing sensitiveness of the detector, connects the detector and its parts in a circuit so arranged as to subject the receiver to current changes, and to cause the exaggeration of said changes for the purpose of rendering the indications loud and clear.

ELECTRIC TESTING INSTRUMENT.—H. G. ADDIE, Cresco, Iowa. In this case the invention refers to testing instruments and admits of general use, but applies more particularly to a type of such instruments used for testing fuses and made in neat form to be carried in the pocket and containing its own supply of current for making the test.

Of Interest to Farmers.

BUTTER MEASURER AND CUTTER.—D. F. CURTIN, St. Louis, Mo. The object of the invention is to provide a device by means of which butter may be cut into prints or blocks and conveniently separated from the rest of the butter in the tub or package, the blocks being of predetermined weight, thereby dispensing with the necessity of weighing the butter, as now commonly done.

Of General Interest.

MOUTH AND NOSE PROTECTOR.—B. WOOLF and T. W. RICHARDS, New York, N. Y. By the use of this invention dust and other flying particles or germs are prevented admission to the nose and mouth. The guard is formed of two separate sections flexibly connected together, one adapted to cover the mouth and the other the nose, and used in connection with a support which serves to hold both sections in their proper position.

TAPE GRIP.—I. D. RICHARDSON, Providence, R. I. In its broadest aspect the invention may be defined as consisting of a rigid bar member of substantially one-half of the length of the first and secured to one face thereof, and means including a lever pivoted to said second bar member for clamping the tape between it and the first mentioned bar member.

FLAG AND BANNER SUPPORT.—E. H. B. LINDHORST, San Francisco, Cal. The support is capable of being raised to or lowered from the truck of a flag pole by means of the customary halyards, and is constructed so that the said support will be maintained at right angles to the pole when there is no breeze, and in a breeze will occupy the same position but will wave and turn in conformity with the breeze.

FIRE EXTINGUISHING SYSTEM.—C. T. ROBERTS, Tucson, Ariz. More particularly the invention pertains to sprinkling systems for mine shafts, although it is evident that the system might be utilized equally as well in various other localities. The object is to deliver the water to the system in such a manner as to prevent the burning of the woodwork of the shaft and to prevent the passage of flames from one level to another.

VULCANIZING APPARATUS.—A. E. CONSWELL, Pretty Prairie, Kan., and J. W. PACKARD, Geneva, Neb. This furnace overcomes former difficulties, and automatically controls and regulates the process without attention from the dentist, and when the vulcanizer is brought to proper temperature it closes a sectional oven about the same, so as to maintain even and prolonged heat, and it shuts off the supply of fuel oil, gas, or heating agency, thus saving fuel, time, avoiding mistakes, etc., without attention from the dentist.

PAPERING APPARATUS.—O. O. CARRY, Converse, Ind. More particularly the invention relates to means for smoothing the paper on the wall after it has been hung, and further means for cutting the paper at the base board. An object is to provide an apparatus which may be used in paper hanging to smooth the paper in position, to cut the paper off at the base-board, and to press out the edges.

CONCRETE CONSTRUCTION AND METHOD OF PRODUCING THE SAME.—G. A. M. LILJENCRANTZ, Chicago, Ill. Blocks made by this process may be used in constructing new superstructures over cribs sunk to the proper height, for rebuilding superstructures over old crib work, for new pier work where large blocks should be placed on a pile foundation sawed off at a suitable height, for docks or rivers where the bottom consists of solid rock; for bridge abutments or intermediate piers, for retaining walls, dams, and other heavy structures, where the cross-section and base must be of considerable magnitude and would make the work very expensive if of solid concrete.

AUTOMATIC SPEED-CONTROLLER.—C. F. PALMER, Spokane, Wash. When adjusted the device may remain in position for use as a means of reaching the ground in case of fire, or for other purposes. As a fire escape, the person may cling to the rods, with the assurance that the controller will regulate his descent, by means of the sprocket chains traveling on the sprocket wheels, connected with the mechanism, for regulating the rotation of the cylinders and the rotary pistons which are connected with the sprocket wheels.

Hardware.

LOCK.—W. J. LAMBERT, North Yakima, and E. P. DOPPS, Sunnyside, Wash. One object in this invention is to provide a simple, strong, and durable combination or permutation lock which is inexpensive to manufacture, which can be easily operated, and which it is practically impossible to unlock without destroying the lock, unless the proper combination or permutation is known.

WINDOW FASTENER.—W. AGIN, Chillicothe, Ohio. The device comprises a casing, bolts arranged at right angles to each other and movable through the casing, one being provided with an enlarged portion having a transverse recess, with an inclined inner edge, the other having a cam within the recess and engaging the inclined face of the recess and a spring between the enlarged portion of the bolt and the casing wall, and a latch pivoted to the enlarged portion of the end wall of the casing having a slot through which the latch passes, the latch having a catch for engaging the edge of the slot for retaining bolts in retracted position.

Heating and Lighting.

APPARATUS FOR WATERING COKE-OVENS.—D. B. STAUFT, Scottdale, Pa. The invention is an improvement in appliances of the character disclosed in Letters Patent formerly granted to Mr. Stauft, for watering coke-ovens, the present invention being particularly directed to improvements in the pivotal support of the revolving sprinkler-pipes, and has for a purpose to provide for the adjustment of the tubular pivot and prevent leakage thereabout.

METHOD FOR PREVENTING THE FORMATION OF BOILER-SCALE.—T. BRAMA, Amstetten, Austria-Hungary. The subject-matter of the invention is a method for preventing the formation of boiler scale, or for preventing the formation of incrustation on the walls of steam boilers and other receptacles under pressure. The method differs from chemical and mechanical processes, or those known heretofore, as the feed water is introduced into the boiler without admixture of chemicals and in a definite form in which it prevents formation of scale.

Machines and Mechanical Devices.

EXPANSION CUTTER HEAD FOR BORING BARS.—CHARLES M. BUCK, Huntington, W. Va. The tool is particularly adapted for boring the hubs of car wheels, although it will be found serviceable in many other applications. It is in the form of a mandrel with a boring head in which adjustable cutters are seated. The cutters are separately adjusted so that one pair can be used as roughing cutters and the other as finishing cutters. An illustrated description of this tool appeared in the issue of June 19th, but the title contained a typographical error, making it read "Cutter Head for Boring Brass" instead of "Boring Bars."

NOTE.—Copies of any of these patents will be furnished by Munn & Co. for ten cents each. Please state the name of the patentee, title of the invention, and date of this paper.

Notes and Queries

Kindly write queries on separate sheets when writing about other matters, such as patents, subscriptions, books, etc. This will facilitate answering your questions. Be sure and give full name and address on every sheet.

Full hints to correspondents were printed at the head of this column in the issue of March 18th or will be sent by mail on request.

(12107) A. K. says: 1. Is the direction of an electric current from positive to negative, or the reverse? A. The direction of an electric current is always taken to be from positive to negative. This is, however, entirely conventional. We could as easily do all electrical work and make all calculations on the theory that the current flows from minus to plus. It is simply by agreement that we consider that pole of a battery plus which is at the end of the carbon plate. 2. Are the two ends of an electrode of the same sign? A. One end of a plate in a battery cell is plus and the other minus. An electrode is the end of an electric circuit, and is of the opposite sign from the other end. The zinc in a cell is plus. The end of the circuit attached to the zinc is the minus electrode of that circuit. 3. Does the current of electricity enter an X-ray tube at the anode or cathode? A. The current is considered to enter a Roentgen ray tube at the anode. The cathode rays stream from the cathode, and strike the anode, producing the rays from the anode. 4. What is the effect of X rays upon the skin exposed to them for a time? A. The Roentgen rays are very injurious to one exposed for a long time to them, producing even death.

(12108) P. G. F. says: Can you give me the scientific theory of what causes diamonds to form in the earth, and what kind of mineral do they form out of before they become a diamond? If you cannot give me any information on diamonds, please inform me where I can get the information. A. Carbon exists in three forms—charcoal, graphite, and diamond. Heat and pressure are thought to be the forces necessary to change the substance from one to the other of the higher and harder forms. Some diamonds have been made artificially by placing carbon in powdered form in melted iron. The iron is then suddenly chilled and cooled, with the result that an enormous pressure is brought upon the carbon particles, and upon dissolving the iron away, tiny pieces of carbon are found as hard as a diamond. They are of microscopic size, but are of interest as possibly illustrating how diamonds have resulted under the great heat and tremendous pressure which have existed in the interior of the earth in remote times. The diamonds which are mined in South Africa are found in holes or pipes, which lead down through the rock strata into the interior of the earth, and it is suggested that they have been brought up from an unknown depth in the melted rock. SUPPLEMENT No. 1571, price 10 cents, deals with the genesis of the diamond.

(12109) F. J. says: I note in your issue of May 15th, in reply to query 12084, you say that the number of contacts between the blades on disks *A* and *B* are the same whether one disk is stationary or whether they both revolve in opposite directions at ten thousand R. P. M. I beg to call your attention to the fact that you have not taken into consideration the distance traveled by the circumference of each disk; therefore if disk *A*, with ten blades, revolving at ten thousand R.P.M., comes in contact with one blade of stationary *B* one hundred thousand times in one minute, then if *B* is started revolving in the opposite direction at the same rate of speed, the number of contacts is exactly double, for the reason that each blade has only to move one-half the distance to make the contact when both disks are revolving. This solution is taken from your diagram, which shows that the disks revolve in a direction so that they strike each other. If the disks revolve in such manner that they would mesh together like the cogs of a wheel, your solution would be correct, and there would be no difference as to whether one or both disks were revolving. A. We thank you for your correction, which is certainly just. Our reasoning was based on the rotation of the wheels in opposite directions, as if they were intermeshing gears, and we overlooked the direction of the arrows on the inquirer's sketch.

(12110) C. N. T. says: As I understand it, the Thermos bottle is constructed on the principle that vibrations will not cross a vacuum. If this is correct, how does an incandescent electric light, with a carbon film in a vacuum, give off both light and heat? A. The Thermos bottle is constructed on the principle that heat waves of low radiant energy will not pass through a vacuum. Heat waves of high radiant energy, such as those from a fire or incandescent body, like those from the sun, will pass easily [illegible]

[illegible] of toy aeroplanes, this little [illegible] will be found very timely [illegible] tours.

TROUBLE FINDER CHART FOR AUTOMOBILISTS. By Roger B. Whitman, Technical Director of the New York School of Automobile Engineers. New York: Whitman & Cameron. Price, 50 cents.

This chart, which was originally published in the last Automobile Number of the SCIENTIFIC AMERICAN, is the most complete chart of the kind which has been brought out up to the present time. In supplying it printed in sections as separate cards, the author has made it available in a very handy form for all automobilists. There are about a dozen cards dealing with effects of timing; make-and-break ignition; jump-spark ignition by battery and coil and by low-tension or high-tension magneto and coil; carburetor; compression; fuel-feed system, and care of these; operation and maintenance. Two of the most useful cards give lubrication tables, showing how to oil every part of the car, while most of the other cards give a complete diagnosis of the troubles that may occur with the different organs, so that any novice can easily locate the trouble and make the necessary repair. This chart will be welcomed by all automobilists.

MRS. RORER'S VEGETABLE COOKERY AND MEAT SUBSTITUTES. Philadelphia: Arnold & Co., 1909. 12mo.; [illegible] pages. Price, $1.50 net.

Mrs. Rorer is regarded, and justly so, as being one of the greatest authorities in the world on the subject of cookery, and her views are perhaps more widely quoted than those of any one else in the culinary world. The great value of Mrs. Rorer's books is the extreme accuracy with which she pens her receipts. They seldom, if ever, fail if the directions are properly followed. There is no more acceptable book for the housekeeper than Mrs. Rorer's New Cook Book, which the present volume admirably supplements. It is very often said that we use too much meat in our American cuisine, and in fact "the American breakfast" is looked upon with horror abroad. It appears to be a fact that many persons can perform their work much better if they have no meat in the morning, and much of the hardest traveling in Europe is done with only the continental breakfast of rolls and coffee. Breakfast, however, with the aid of this book can occupy a middle ground between the sodden meat breakfast and the scanty French breakfast. Many of the meat substitutes are admirable. The receipts are very carefully arranged, and the book is well printed and bound. It is one which we can heartily commend to all our readers.

BOX FURNITURE; HOW TO MAKE A HUNDRED USEFUL ARTICLES FOR THE HOME. By Louis Brigham. New York: The Century Company, 1909. 12mo.; 304 pages. Price, $1.[illegible] net.

The author has produced a very remarkable work. It is very curious what can be done with a few old boxes. Here are some of the articles enumerated: Plant box, golf-stick stand, kitchen stool, hanging lantern, coal box, blacking box, clock case, spice box, pipe rack, knick-knack brackets, housewife's handy rack, magazine racks, shoe cupboards, flower stands, wash stands, writing desks, book cases, [illegible] stands, office files, [illegible] tables, [illegible] stands, photographic material stands, [illegible] presses, chafing-dish table, [illegible] rack, wall rack, tea table, window seat, [illegible] wardrobe, sideboard, [illegible] closet, hall [illegible], etc. [illegible] are given. The [illegible] of raw materials are stated. Then follows a detailed description of the construction. We have not seen any book that [illegible]

WIRELESS TELEGRAPHY [illegible]

[illegible] about an [illegible] plane [illegible] A and B (Fig. 3) cannot be made to coincide by any movements in their own plane, but by rotating one of them 180 deg. in the fourth dimension it can be made to coincide with the other. Similarly, two symmetrical volumes (with faces equal but in reverse order) such as the hollow pyramids C and D (Fig. 4) cannot be made to coincide by any movements in our space, but by rotating one of them 180 deg. in hyperspace this can be done. The rotating pyramid disappears from our space, and upon its return after rotating 180 deg. it can be slipped into the other. In our space two movements of rotation will combine into a single resultant rotation, similar to its component rotations except that the direction of the axis is different. In hyperspace however, there is in general no resultant for two rotations. Hence there are two different types of rotation in hyperspace and a body subject to two rotations is in a totally different condition from that which it is in when subject to one only. When subject to one rotation a whole plane of the body is stationary. When subject to the double rotation no part of the body is stationary except the point containing the two planes of rotation and if the two rotations are equal every point in the body except that one describes a circle.

Freedom of movement is greater in hyperspace than in our space. The degrees of freedom of a rigid body in our space are 6 namely 3 translations along and 3 rotations about 3 axes while the fixing of 3 of its points can prevent all movement. In hyperspace however with 3 of its points fixed it could still rotate about the plane passing through those points. A rigid body has 10 possible different movements in hyperspace namely 4 translations along 4 axes and 6 rotations about 6 planes while at least 4 of its points must be fixed to prevent all movement. A material point in our space can be prevented from moving by connecting it rigidly with three fixed points outside in hyperspace it must be rigidly connected with at least 4 points outside.

In hyperspace a sphere if flexible could without stretching or tearing be turned inside out. Two rings of a chain could be separated without breakage. Our knots would be useless. Thus the knot shown in Fig 5 could be unknotted without removing the fastened ends. Just as in our space a point can pass in and out of a circle without touching its circumference, so in hyperspace a body could pass in and out of a sphere (or other inclosed space) without going through the surface surrounding it. In short, all of our space including the interior of the densest solids is open to inspection and manipulation from the fourth dimension, which extends in an unimaginable direction from every point of space.

Has hyperspace a real physical existence? If so, our universe must have a small thickness in the fourth dimension otherwise like the geometrical plane assumed to be without thickness our world too would be a mere abstraction (as in fact some idealistic philosophers have maintained), that is nothing but "a shadow cast by a more real four-dimensional world." The real existence of a small extension in the fourth dimension would, moreover, simplify certain scientific theories. For instance, in our space the greatest number of points whose mutual distances [illegible] are all [illegible] each other, but in hyperspace [illegible] any 5 [illegible] geometrically [illegible] freedom of [illegible] the atoms, it [illegible] space would explain the change of a body producing a right-handed into one producing a left handed polarization of light. Further Prof McKendrick said before the British Association 'It is conceivable that life may be the transmission to dead matter [illegible] of a form of motion *sui generis*. Hyperspace has been brought somewhat in disrepute because spiritualists have assumed its existence in order to give a local habitation to their vagaries. Nevertheless the possibility of its existence has not yet been shown to be inconsistent with any scientific fact and the limitation of space to three dimensions though probably correct is therefore purely empirical.

Of what use then is the conception of hyperspace? For one thing it gives a deeper insight into geometry. Thus a circle considered merely as a one dimensional aggregate of points has very few properties while in a plane it has a center radii tangents etc and in 3 space has further numerous geometrical relations with the sphere cone etc. Similarly the properties of any given line or surface increase in number when investigated in hyperspace. Also just as it requires a 3-space to include certain one dimensional aggregates (the helix for instance) so in hyperspace hitherto unknown lines and surfaces become mathematically possible. Lower spaces are contained in higher (if curved not necessarily the next higher) and just as the comprehension of plane geometry is enlarged by viewing plane figures in 3 space so solid geometry is much illuminated by the geometry of hyperspace. Fields of mathematics hitherto inaccessible to geometry are now elucidated by geometrical representations. Finally this conception effects a complete divorce between geometric space and real space no longer considered necessarily identical and in other ways also enlarges our mental horizon.

◆

A MUSEUM TO ILLUSTRATE THE DEVELOPMENT OF MATHEMATICS

(*Continued from page 10*)

two astrolabes of Italian make and dating back to the fifteenth and sixteenth centuries are illustrated so that it is possible to appreciate their fine workmanship and the accuracy of the division of the circular scales. Then at this time there were various forms of celestial spheres planispheres or armillary spheres where a number of concentric circles were used to illustrate the motion of earth and planets. In the celestial sphere a sixteenth century example of which of Italian workmanship is shown herewith the principal circles of the heavens are represented as well as the polar axis located within meridian and horizon circles at the center of which the observer is supposed to be. With such armillary spheres of which the collection contains a number of specimens the motions of planets and earth could be shown and also direct measurements could be made. Not only are there Italian and German instruments of this kind dating back to the fifteenth and sixteenth centuries and used by such astronomers of that time as Tycho Brahe but there are similar instruments from India Persia and Arabia one of which in modern times was used by Pandit Joshti in the restoration of the ancient observatory of Jaipur India. The similarity of the instruments of Europe and Asia is very striking and interest is heightened by the exhibition with the latter of Hindu and Persian texts explaining their use. Indeed the correspondence between the methods and instruments of peoples remote from one another as brought out in the exhibition is often most impressive and a comparison of a Japanese sphere of the sixteenth and seventeenth centuries with European spheres of the same period shows many points of identity.

Not a few Japanese instruments and manuscripts are included in the collection as for example the surveying com

SPARK COILS
Their Construction Simply Explained
Scientific American Supplement 160 describes the making of a 1½-inch spark coil and condenser.
Scientific American Supplement 1514 tells you how to make a coil for gas-engine ignition.
Scientific American Supplement 1522 explains fully the construction of a jump spark coil and condenser for gas-engine ignition.
Scientific American Supplement 1124 describes the construction of a 6-inch spark coil.
Scientific American Supplement 1087 gives a full account of the making of an alternating current coil giving a 5-inch spark.
Scientific American Supplement 1527 describes a 4-inch spark coil and condenser.
Scientific American Supplement 1402 gives data for the construction of coils of a definite length of spark.
The above-mentioned set of seven papers will be supplied for 70 cents.
Any single copy will be mailed for 10 cts.

PATENTS
INVENTORS are invited to communicate with Munn & Co., 361 Broadway, New York, or 625 F Street, Washington, D. C., in regard to securing valid patent protection for their inventions. Trade-Marks and Copyrights registered. Design Patents and Foreign Patents secured.
We undertake all Patent, Trade-Mark and Copyright Practice, both before the Patent Office and the Courts, and we have special facilities for handling Infringement and other suits in Federal and State jurisdictions.
A Free Opinion as to the probable patentability of an invention will be readily given to any inventor furnishing us with a model or sketch and a brief description of the device in question. All communications are strictly confidential. Our Hand-Book on Patents will be sent free on request.
Every patent secured through us receives special notice in the Scientific American
Ours is the Oldest agency for securing patents; it was established over sixty years ago.

(Continued from page 15)

passes shown in the accompanying illustration. While these particular instruments are comparatively modern, being of the early nineteenth century, yet they antedate the general introduction of western ideas into Japan, so that their makers doubtless derived their inspiration from either Jesuit or Dutch East India Company influences. The manuscript shown in the background is one of a number of Japanese treatises on surveying belonging to Prof. Smith, in which the diagrams, often in color, are most artistically executed.

Returning from the East, our interest is attracted by a small wooden cylinder with vertical slits which was used by the early Italian surveyors. It is known as a *squadra*, and could be mounted on a staff, where by sighting through its slits arranged at angles of 90 deg. and such other convenient angles as might be needed, it was possible to run the boundary lines of land. A common level used in the same fashion as the more modern gunner's quadrant, and placed on the breech of a cannon to determine the elevation, is a small but excellent piece of Italian make, while a German level of the eighteenth century suggests rather more closely modern surveying instruments. This tendency is even more evident in the German surveying instrument of the early nineteenth century, which, lacking the telescope and compass, has almost every essential feature of the modern transit or universal instrument, being designed for the measurement of both horizontal and vertical angles, and showing fine workmanship and accurate division of the circles.

The mathematician is always interested in weights and scales, for aside from the arrangement of various forms of weighing devices, the division of the weights themselves and the relation of the standards and units present many problems. Thus there are many scales and balances which show the various applications and modifications of the lever, and especially in the case of those belonging to primitive people they are valuable in bringing out the development in the art of weighing. The European weights, two nests of which are shown in the photograph with the Bavarian spring balance, were often of beautiful workmanship, and the subdivision was carried out with an accuracy that is most surprising.

The measure of time also finds an important place in the museum, for the calculation of the calendar in all religions was one of chief occupations of mathematicians, but especially in the early Christian church for the computation of Easter. The Buddhist temples of Japan were concerned with calendars quite as much as the Western Church, and their calendar rolls of the sixteenth and seventeenth centuries and other appurtenances show the attention paid to the subject on this side of the world. Accompanying the instruments themselves in most cases throughout the museum are to be found the contemporary authorities in book or manuscript, and while three of the earliest publications on the reform of the calendar by Pope Gregory supply first hand information to the student in this field, there are also Chinese, Japanese, Hindu, Church Latin and other manuscripts in addition to works in the tongues of mediæval and modern Europe for the investigator with such languages at his command. Prof. Smith has collected from East and West representatives of all the important forms of portable sun dials, many of which exhibit artistic merit in their design and construction besides considerable complexity in their arrangement. An interesting sun-dial from Peking is shown in the illustration, where, with its divided circles marked with Japanese characters, its compass and other features, a number of points of interest are presented.

In a museum of mathematics there are of course to be found in plenty compasses, sectors, protractors, diagonal scales and

SENSITIVE LABORATORY BALANCE
By N. Monroe Hopkins. This "built-up" laboratory balance will weigh up to one pound and will turn with a quarter of a postage stamp. The balance can be made by any amateur skilled in the use of tools, and it will work as well as a $125 balance. The article is accompanied by detailed working drawings showing various stages of the work. This article is contained in SCIENTIFIC AMERICAN SUPPLEMENT No. 1184. Price 10 cents. For sale by MUNN & CO., 361 Broadway, New York City, or any bookseller or newsdealer.

LEARN WATCHMAKING
[illegible]

(Continued from page [illegible].)

[illegible] instruments, which, extending from Roman to Renaissance and later times, indicate very clearly the developments in this field, while the specimens of measures of length shown suggest most forcefully the chaotic conditions that but little more than a century ago prevailed in metrology when every nation and almost every town had its individual and peculiar standards quite unlike the others except in having the same names. One of the measures well illustrating this condition is a brass Austrian ell standard of 1782, while the various gagers' scales show the debts that metrology and mensuration owe to the collection of excise taxes.

From the slates and possible abaci of the neolithic age in Egypt to the modern counting arithmometer of the accountant or professional calculator certainly is a far cry, but the steps are marked and are shown in this collection. In the beginning is a squeeze or impression from the Salamis abacus, the earliest one known, then the Chinese swan pan, the Japanese soroban, the Korean bones, the old Japanese sangi, the Russian stchoti, the Armenian abacus and other similar forms, many of which still in use suggest the familiar frame and beads of the primary school. But by such schemes, slide rules and more involved devices artificial calculation has progressed to its present state.

The many readers of the SCIENTIFIC AMERICAN interested in magic squares perhaps will be surprised to learn that in the Yih King, one of the greatest Chinese classics, here shown in written manuscript on silk, is found the first trace of the magic squares attributed to Fuh Hi (B. C. 3322), *the traditional founder of* the nation, as well as of permutations and possibly of binary numerals. Indeed number mysticism as shown in the magic squares and like phenomena turns up in many interesting forms and places, as is shown here by plaster casts of inscriptions from Chittagong, India, and in more modern times in a reproduction of Durer's Melancholia, where is exhibited the oldest magic square known to exist in print. The magic squares by inscriptions and manuscripts may be traced in astrology, while some interesting Pali and Singhalese manuscripts on palm leaves show forms of its expression in India.

A collection of dice would seem hardly in place in an educational museum, but as the historical development of this game, which is one of the oldest if not the oldest of the many number games, can be traced over at least 3 000 years, it lends itself readily to exposition. And it is important further in that its influence in educating people in the use of numbers has been second only to the school. In Prof. Smith's collection we can view dice from Etruscan tombs, from the remains of the Persian invaders from Karnak in Egypt, a divination eikosahedral piece of the Ptolemaic period, long dice of the Roman conquerors of lower Egypt, loaded dice of Rome, dice of Renaissance Europe, and so on to our own times.

The many medals of famous mathematicians here shown of themselves make a unique exhibition, with Newton honored by twelve different medals and others happily [illegible] famous in proportion, and these with the original manuscripts, autographs, and portraits bring to the study of their works much that is personal. And we find the mathematicians of the East represented with those of the West, there being such documents as manuscripts of the work of Bhaskara, the greatest of native Hindu mathematicians, who flourished in the twelfth century, and whose work was influential both in India and the adjacent countries of Ceylon and Persia. There are facsimiles of the Ahmes and [illegible] Egyptian papyri, the former of which is the oldest manuscript extant and [illegible] from about 1700 B. C. [illegible] a treatise of about [illegible] of ideas and [illegible] mathematical science from [illegible] only to be brought

Lambert Model B2 $2 000
The Proven Quality
which buyers of big cars demand is found in the 7 passenger Lambert Model B2 and at a price most buyers would prefer to pay. This handsome, roomy, powerful car has every bit of automobile worth we can put into it. If our price were $3 000 the car wouldn't be any better. It's a *satisfaction* car from motor to tail lamp.
Model B2 has 4 cylinder Rutenber Motor with adjustable fan attached; 35-40 H. P.; speed 1-45 miles per hour; Lambert friction (most efficient) transmission; direct chain drive to each rear wheel; wheel base, 106 inches; 32 × 4 pneumatic quick detachable tires; painted imperial green, striped with carmine; cape extension top with full set storm curtains; liberal equipment of accessories and full tool kit.
Each of our six Lambert models has a full dollar's worth of power, speed, endurance, style and finish for every dollar of the price—and more too, if judged by ordinary standards.

Looms, weft [illegible] mechanism for, [illegible] J. Gabler	925 891
Lunch box, J. J. Bird	925 447
Machine knives and making the same, composite stock for, I. Searle	925 661
Magnet, H. R. Hand	925 971
Mail [illegible] and delivering apparatus, J. Wood	[illegible] 118
Mail handling apparatus, pneumatic, Riggs & Baker	[illegible]
Mail loader, J. R. Modill et al	925 491
Mail receiving and delivering apparatus, A. J. Walk	925 [illegible]
Marble shooter or gun, J. A. Radebaugh	925 944
Marking machine, G. C. Kutz	925 [illegible]
Match box, F. F. Laffer	925 [illegible]
Match box, I. C. Lang	925 [illegible]
Match holder, W. A. Smith	926 029
Match receptacle and igniter, combined, E. Lamprecht	925 924
Measuring glass, A. Kipp	925 [illegible]
Measuring instrument, J. Green	925 [illegible]
Mechanical movement, D. K. Wilson	925 547
Mechanical movement, A. I. Crell	925 [illegible]
Medicament, producing a, W. D. Neel	925 580
Merry-go-round and aquatic, H. N. Riell	925 [illegible]
Metals from ores and other substances, apparatus for recovering, J. Dixon	925 [illegible]
Metals of a highly refractory nature, apparatus for producing homogeneous ductile bodies from, W. von Bolton	925 708
Microphone, H. R. Stuart	925 909
Mines, trap door for, V. A. & H. J. [illegible]	[illegible]
Mine, artificial, W. G. Kahl	925 [illegible]
Mixer. See Mortar mixer.	
Molding apparatus guides, forming, Dawes & Lowe	925 686
Molding apparatus, guiding device, Lawes & Lowe	925 687
Molding hollow articles in metal by means of divided patterns, H. & T. Reform	925 724
Mop, C. H. Davis	925 758
Mop wringer, W. J. Briles	925 [illegible]
Mortar mixer, I. I. Hoskins	925 744
Motor, Barnes & Smith	925 [illegible]
Motor controlling mechanism, I. R. Brown	925 [illegible]
Mower track cleaner, G. Braun	925 [illegible]
Multiple drill, H. K. Hawes	925 474
Music rack, J. C. Dillon	925 [illegible]

Classified Advertisements

Advertising in this column is 75 cents a line. No less than four nor more than ten lines accepted. Count seven words to the line. All orders must be accompanied by a remittance. Further information sent on request

READ THIS COLUMN CAREFULLY.—You will find inquiries for certain classes of articles numbered in consecutive order. If you manufacture these goods write us at once and we will send you the name and address of the party desiring the information. There is no charge for this service. In every case it is necessary to give the number of the inquiry. Where manufacturers do not respond promptly the inquiry may be repeated.

MUNN & CO

BUSINESS OPPORTUNITIES

A LARGE MANUFACTURING COMPANY with exceptionally fine metal and wood working facilities, are interested in securing a good specialty to add to their present line. Owners of ideas, whether wholly developed or not, may find it to their advantage to communicate with us at once. Address Specialty, Box 773, N. Y.

PATENTS FOR SALE

FOR SALE.—Outright or royalty. Shutter hinge. Shutter cannot be blown shut or rattled by strong winds. Does away with the old fashioned turn buckle. United States patent No. [illegible]. Canadian patent No. [illegible]. Non refillable bottle. United States patent No. [illegible]. Simple, cheap and practical. For further information and full particulars address R. Witman, Jr., Wernersville, Pa.

Inquiry No. 8898.—Wanted to buy nickeloid for buttons.

FOR SALE. Patent on gas drop light. Will be issued June 22. Just what the market is looking for. For particulars address C. M. Pitel, Meriden, Conn.

Inquiry No. 8904. Wanted to buy new or second hand machinery for making "bow type," mouse and rat trap springs and wire parts, single machine or full outfit.

FOR SALE

FOR SALE.—Specialty for manufacturers. Dental floss holder, patented May 1909. For further particulars apply direct to inventor T. A. Tubbs, Seattle, Wash., care U. S. Emerson Company.

Inquiry No. 8908.—For a dealer in tapes and cords for Venetian blinds.

FOR SALE by private Treaty, a small collection of First Editions of Early Scientific Works, comprising Luca de Burgo, 1494; Cardan, 1545; Tartaglia, 1556; Vieta, 1591; Euclid, 1570; Gilbert, 1600; Kepler, 1609; Copernicus, 1543, etc. Address Box [illegible], care Willings, 125, Strand, London, W. C., England.

Inquiry No. 8918. For manufacturers of "Wydt's Electro-Catalytic Sparking Plug."

Inquiry No. 8921.—For the manufacturers of gilt paper.

HELP WANTED

LOCAL REPRESENTATIVE WANTED.—Splendid income assured right man to act as our representative after learning our business thoroughly by mail. Former experience unnecessary. All we require is honesty, ability, ambition and willingness to learn a lucrative business. No soliciting or traveling. This is an exceptional opportunity for a man in your section to get into a big paying business without capital and become independent for life. Write at once for full particulars. Address E. R. Marden, Pres., The National Co-operative Real Estate Company, Suite 3[illegible], Marden Building, Washington, D. C.

Inquiry No. 8922.—Wanted the address of Worthington Boiler Co.

PARTNERS WANTED

WANTED PARTNER to invest $10,000 to manufacture a new and successful electric clock, made at small cost, attached to electric light or power circuit. One master clock controls 200 clocks. For office buildings, court houses, etc. Principals only. Address Frank B. Andrews, 419 Superior Ave. N. W., Cleveland, O.

Inquiry No. 8928. For the manufacturers of a steam rotary excavator as described in the Scientific American of December 12 1908, page [illegible]

LISTS OF MANUFACTURERS

COMPLETE LISTS of manufacturers in all lines supplied at short notice at moderate rates. Small and special lists compiled to order at various prices. Estimates should be obtained in advance. Address Munn & Co., List Department, Box 773, New York.

Inquiry No. 8931.—For parties who manufacture the Western Stump Borer for boring stumps.

Inquiry No. 8936.—Wanted machinery used to spin or wrap paper pencils in the manner that paper pencils are made.

A LIST OF 1,500 mining and consulting engineers on cards. A very valuable list for circularizing, etc. Price $15.00. Address Munn & Co., List Department, Box 773, New York.

MISCELLANEOUS

TOBACCO HABIT CURED OR NO COST. Harmless home treatment. Ni-Ko Rem. Co., Wichita, Kansas.

Inquiry No. 8941. For manufacturers of machinery for making fly screens.

Inquiry No. 8947.—Wanted manufacturers of angle bars either malleable steel or sheared.

Inquiry No. 8950.—For the address of the Windsor Mfg. Co., manufacturers of waterproof collars and cuffs.

Inquiry No. 8966. Wanted the address of the Cohendet Motor Co.

Inquiry No. 8969.—Wanted machines that make accordion dress plaiting (steam).

Inquiry No. 8970.—Wanted to buy complete outfit for making meat hooks.

Inquiry No. 8971.—For address of firms interested in fishing reels.

Inquiry No. 8973.—Wanted the address of the builders of moving stair cases.

Inquiry No. 8977. For manufacturers of machinery for manufacturing denatured alcohol.

Inquiry No. 8978. Wanted the address of manufacturers of dry pans or crushers to grind sand for plastering and cement works.

Inquiry No. 8980. For the address of manufacturers of mortars and pestles that are used by druggists.

Inquiry No. 8982. Wanted a machine or process for slitting or laminating the edges of heavy cardboard, impregnating the slit or laminated edge with a waterproof material and compressing the edge after treatment. The object of the process is to produce an edge that shall be waterproof and which shall not fray or split when in use.

Inquiry No. 8984. Wanted the address of the manufacturers of Cypress wash tubs.

Inquiry No. 8986.—Wanted to buy crown and flint glasses for telescope objectives.

Inquiry No. 8987.—Wanted the [illegible] of the Van Winkle, Woods & Rose, and the Weber power motors.

Inquiry No. 8989.—Wanted a machine for making cocoa fiber mats.

Inquiry No. 8990.—For information regarding shoes not made of leather but similar to the same and are as durable.

Inquiry No. 8991.—Wanted to communicate with manufacturers of large straw hats for every-day wear.

Inquiry No. 8992.—Wanted to buy producer gas plants.

Inquiry No. 8994.—For manufacturers of an apparatus to produce very high temperatures.

Inquiry No. 8995. Wanted to buy round and oval glass paper weights, such as are used for mounting photographs.

Inquiry No. 8996.—Wanted addresses of manufacturers of machinery for working orange wood manicure sticks.

Inquiry No. 8997.—Wanted the address of the manufacturers of bread or cake boxes.

Inquiry No. 8998.—Wanted an automatic snap, ball and socket or other device which can be used easily and securely to fasten together the edges of small wooden boxes.

Musical instruments, combined brake and rewinder for automatic, J. Skubic	925,685
Needle, H. M. Sanders	925,953
Nipple, T. W. Miller	926,011
Nose glasses, B. J. Knapp	925,921
Nozzle holder, E. Burns	925,690
Nozzle, hydraulic, W. A. Doble	926,055
Nozzle, syringe, E. T. Pearl	925,718
Nut lock, A. McKinley	925,406
Nut lock, W. E. Hall	925,890
Nut lock, E. M. Lovell	926,027
Nut lock, combination, J. Sharp	925,612
Oil burner, W. S. Robinson	925,841
Oil burner, adjustable downdraft, D. C. Lamb	926,006
Oil switch, H. W. Cheney	926,004
Oiler, fountain, O. O. Anne	925,794
Opera chair, A. R. Milner	925,492
Optical instrument, A. Hahn	926,061
Ore feeder, N. V. Fitts	926,065
Oven door holder or catch, O. P. Monn	925,936
Package, O. R. Tyson	925,535
Packing, casing, C. L. Cook	925,460
Packing, metallic, C. L. Cook	925,459
Pail, A. Cleveland	925,457
Pan. See Automobile under pan.	
Pantograph, H. A. Verbeck	925,669
Paper and wood pulp receptacle, J. W. McCleery	926,038
Paper feeding machine, T. C. Dexter	925,879
Paper package, C. F. Jenkins	925,913
Paper pail, W. G. Haas	925,578
Paper receptacle, H. S. Dill	926,057
Paving block, W. Hanley	926,049
Peanut picker and stemmer, J. T. Benthall	925,983
Penholder, A. W. Pegg	925,719
Percolator, F. S. Peck 925,831	925,836

Shoe ventilator, [illegible]	[illegible]
Shovel. See Snow shovel.	

Practical and Instructive Scientific Books

AGRICULTURE.—The New Agriculture. By T. Byard Collins. 12mo., 374 pages; 106 illustrations. $2.00

A popular outline of the many changes which are revolutionizing the methods of farming, and the habits of farm life. It is one of the most practical treatises on the subject which has ever been issued.

ALCOHOL.—Industrial Alcohol. Its Manufacture and Uses. By John K. Brachvogel. 8vo., 528 pages; 107 illustrations. $4.00

A practical treatise based on Dr. Max Maercker's "Introduction to Distillation," as revised by Drs. Delbruck and Lange, comprising raw material, mashing and yeast preparation, fermentation, distillation, rectification and purification of alcohol, alcoholometry, the value and significance of a tax-free alcohol, methods of denaturing, its utilization for light, heat, and power production, a statistical review, and the United States law.

AMATEUR MECHANICS.—Home Mechanics for Amateurs. By George M. Hopkins. 12mo., 370 pages, 326 illustrations. $1.50

This is a thoroughly practical book by the most noted amateur experimenter in America. It appeals to the boy as well as the more mature amateur. Holidays and evenings can be profitably occupied by making useful articles for the home or in the building of small engines or motors or scientific instruments.

AMUSEMENTS.—The Scientific American Boy. By A. Russell Bond. 12mo, 317 pages, 340 illustrations. $2.00

This is a story of outdoor boy life, suggesting a large number of diversions which, aside from affording entertainment, will stimulate in boys the creative spirit. In each instance complete practical instructions are given for building the various articles.

COMPRESSED AIR.—Compressed Air. Its Production, Uses, and Application. By Gardner D. Hiscox. 8vo, 665 pages, 540 illustrations. $5.00

The most complete book on this subject. It treats on its physical and operative properties, and is written by an expert. Taken as a whole it might be called an encyclopedia of compressed air.

DIES.—Their Construction and Use for the Modern Working of Sheet Metals. By Joseph V. Woodworth. 8vo., 384 pages, 505 illustrations. $3.00

A most useful book, and one which should be in the hands of all engaged in the press working of metals, treating on the designing, constructing, and use of tools, fixtures and devices, together with the manner in which they should be used in the power press, for the cheap and rapid production of sheet metal articles.

ELECTRICITY.—The Standard Handbook for Electrical Engineers. Written and compiled by a Staff of Specialists. Second edition, corrected. 12mo. 1285 pages, 1260 illustrations. Bound in flexible morocco. $4.00

A new pocketbook consisting of twenty sections, each written by a specialist of engineering experience and containing the latest data and information regarding standard electrical practice.

ELECTRICITY.—Electrician's Handy Book. By T. O'Conor Sloane. 761 pages, 556 illustrations. Handsomely bound in red leather, pocket-book style. $3.50

This work is intended for the practising electrician who has to make things go. Although the principles of electricity and magnetism are treated, the greater part of the book is devoted to practical handling of machinery, details of construction, and computations such as will be encountered *in every-day practice.*

GAS ENGINES.—Modern Gas Engines and Producer Gas Plants. By R. E. Mathot. 8vo, 314 pages, 152 illustrations. $2.50

A practical treatise setting forth the principles of gas engines and producer design, the selection and installation of an engine, conditions of perfect operation, producer gas engines and their possibilities, the care of gas engines and producer gas plants, with a chapter on volatile hydrocarbon, and oil engines.

GAS ENGINES.—Gas, Gasoline, and Oil Engines. Including Producer Gas Plants. By Gardner D. Hiscox. 8vo., 442 pages, 351 illustrations. $2.50

A complete book on the subject for gas engine owners, gas engineers, and intending purchasers of gas engines, treating fully on the construction, installation, operation, and maintenance of gas, gasoline, kerosene and crude petroleum engines, with special information on producer and suction gases.

GAS ENGINES.—Gas Engine Construction. By H. V. A. Parsell and A. J. Weed. 8vo., 304 pages, 145 illustrations. $2.50

A practical treatise describing the theory and principles of the action of gas engines of various types, and the design and construction of a half horse-power gas engine, with illustrations of the work in actual progress, together with the dimensioned working drawings giving clearly the sizes of the various details.

HEATING.—Practical Steam and Hot Water Heating and Ventilation. By Alfred G. King. 8vo., 402 pages, 304 illustrations. $3.00

An original and exhaustive treatise, prepared for the use of all engaged in the business of steam, hot water heating, and ventilation. The standard and latest book published. Describes all of the principal systems of steam, hot water, vacuum, vapor, and vacuum-vapor heating, together with the new accelerated systems of hot water circulation, including chapters on up-to-date methods of ventilation.

HYDRAULICS.—Hydraulic Engineering. By Gardner D. Hiscox. 8vo., 315 pages, 305 illustrations. $4.00

A practical work treating on the properties, power, and resources of water for all purposes, including the measurement of streams, the flow of water in pipes or conduits, the horse-power of falling water; turbine and impact water wheels; wave motors, centrifugal, reciprocating, and air-lift pumps, etc.

INDUCTION COILS.—The Design and Construction of Induction Coils. By A. Frederick Collins. 8vo., 295 pages, 160 illustrations. $3.00

This work gives in minute details full practical directions for making eight different sizes of coils, varying from a small one giving a ½-inch spark to a large one giving 12-inch sparks. The dimensions of each and every part down to the smallest screw are given, and the descriptions are written in language easily comprehended.

LATHES.—Modern American Lathe Practice. By Oscar E. Perrigo. 8vo., 424 pages; 314 illustrations. $2.50

A new book describing and illustrating the very latest practice in lathe and boring mill operations, as well as the construction of and latest developments in the manufacture of these important classes of machine tools.

[illegible]

This [illegible] all [illegible] trades are pursued.

MECHANICAL MOVEMENTS.—[illegible] Gardner D. Hiscox. [illegible] 1,300 illustrations. [illegible]

This is a collection of [illegible] inventor, the draftsman, [illegible] mechanical tastes.

MECHANICAL APPLIANCES.—[illegible] Novelties of Construction. By Gardner D. Hiscox. 8vo.; 396 pages; [illegible] illustrations. [illegible]

This book, while complete in itself, is in fact a continuation of the author's "Mechanical Movements, Powers, and Devices." The author presents to the reader information regarding [illegible] conceivable devices for producing motion or accomplishing mechanical results.

SPECIAL OFFER: These two volumes sell for $3 each, but when they are ordered at one time from us, we send them prepaid to any address in the world, on receipt of $5.

PATENTS.—Practical Pointers for Patentees. By F. A. Cresee. 12mo.; 144 pages. $1.00

Containing valuable information and advice on the sale of patents and elucidation of the best methods employed by the most successful inventors in handling their inventions. It gives exactly that information and advice about handling patents that should be possessed by every inventor who would achieve success.

PHYSICS.—Experimental Science. Elementary, Practical, and Experimental Physics. By George M. Hopkins. In two volumes. 8vo.; 1,105 pages; 918 illustrations. Cloth, $5.00. Half morocco, $7.00

This book treats on the various topics of physics in a popular way and describes with rare clearness and in detail the apparatus used, and explains the experiments in full, so that teachers, students, and others interested in physics may readily make the apparatus without great expense and perform the experiments without difficulty.

PLUMBING.—Modern Plumbing Illustrated. By R. M. Starbuck. 392 pages; 10¼ x 7¾. 55 full-page engravings. $4.00

A comprehensive and up-to-date work illustrating and describing the drainage and ventilation of dwellings, apartments, and public buildings, etc. The very latest and most approved methods in all branches of sanitary installation are given.

PUNCHES.—Punches, Dies, and Tools for Manufacturing in Presses. By Joseph V. Woodworth. 8vo.; 482 pages; 702 illustrations. $4.00

This work is a companion volume to the author's other work entitled "Dies, Their Construction and Use." It might well be termed an encyclopedia on die making, punch making, die sinking, and sheet metal working.

RECEIPTS.—The Scientific American Cyclopedia of Receipts, Notes and Queries. Edited by Albert A. Hopkins. Containing 15,000 selected formulas. 8vo.; 734 pages. Cloth, $5.00. Sheep, $6.00. Half morocco, $6.50

Over 15,000 selected receipts are here collected, nearly every branch of the useful arts being represented. The alphabetical arrangement with abundant cross references makes it an easy work to consult. It has been used with equal success by chemists, technologists, and those unfamiliar with the arts, and is a book which is useful in the laboratory, factory, or home.

REFERENCE BOOK.—Scientific American Reference Book. Compiled by Albert A. Hopkins and A. Russell Bond. Containing 50,000 facts. 12mo.; 516 pages; illustrated. $1.50

This book deals with matters of interest to everybody. It contains 50,000 facts, and is much more complete and more exhaustive than anything of the kind which has ever been attempted. It is indispensable to every family and business man. It is a book for every-day reference—more useful than an encyclopedia, because you will find what you want in an instant in a more condensed form.

STEAM ENGINE.—Modern Steam Engineering in Theory and Practice. By Gardner D. Hiscox. 8vo.; 487 pages; 405 illustrations. $3.00

This is a complete and practical work issued for stationary engineers and firemen, dealing with the care and management of boilers, engines, pumps, superheated steam, refrigerating machinery, dynamos, motors, elevators, air compressors, and all other branches with which the modern engineer must be familiar.

TELEPHONE.—Telephone Construction, Installation, Wiring, Operation, and Maintenance. By W. H. Radcliffe and H. C. Cushing, Jr. 16mo.; 171 pages; 125 illustrations. $1.00

A practical book intended for electricians, wiremen, engineers, contractors, architects, and others interested in the installation of telephone exchanges in accordance with standard practice. Intricate mathematics are avoided, and all apparatus, circuits, and systems are thoroughly described. Selected wiring tables, which are very helpful, are also included.

TOOLS.—American Tool Making and Interchangeable Manufacturing. By Joseph V. Woodworth. 8vo.; 535 pages; 601 illustrations. $4.00

A complete practical treatise containing a valuable collection of drawings and descriptions of devices, the results of the author's own experience.

TOOLS.—Modern Machine Shop Tools. By W. H. Vandervoort. 8vo.; 552 pages; 673 illustrations. $4.00

A new and fully illustrated work describing in every detail the construction, operation, and manipulation of both hand and machine tools; being a work of practical instruction in all classes of machine shop practice.

WIRELESS.—[illegible] 12mo.; 272 pages; 156 illustrations. [illegible]

This work is a thoroughly practical treatise [illegible]

Any of the above books will be sent prepaid on receipt of price.

Our complete catalogue of scientific and technical books sent free on application

MUNN & COMPANY, • Publishers, • 361 Broadway, New York

(Concluded from page 17)

back again to Europe by the Arabs, is strikingly illustrated in an Arabic manuscript of the famous mathematician of Alexandria, Euclid, the father of geometry, which dates from about 1300 A D and is thought to be the oldest surviving manuscript of this great work But Euclid went even to China, and Prof Smith has a Chinese translation by Matteo Ricci, written about 1600

With the revival of learning in Europe the Arabic manuscripts were translated into Latin and there are in the collection several editions of the fifteenth and sixteenth centuries. With a brief reference to the casts of the Babylonian mathematical tablets found at Nippur, and original cylinders with mathematical inscriptions in cuneiform characters it is only possible to mention further the material accumulated for the study of the growth of various number systems, especially among the Hindus, Arabs, Greeks Romans, and Chinese This is shown in the reckoning counters, in the money, in strings of beads for ornament and for religious use and in various commonplace articles, where the growth of the realization of numbers and the development of the number sense is typified

It would indeed be harder to find a more impressive or direct way of demonstrating the part that mathematics has played in the development of civilization and knowledge than by a study of Prof Smith's unique collection which appeals with quite as much force to the casual observer as to the student of mathematical science.

◆

Insect Powder

Dalmatian or Persian insect powder consists of the dried and pulverized flowers of two species of chrysanthemum (sub-genus *Pyrethrum*) of which one grows wild in profusion on the snowy mountain slopes of Montenegro and the neighboring districts of Albania Dalmatia, Herzegovina, and Italy The other species is a native of Asia Minor The exportation of pyrethrum powder from Montenegro began in 1865 The price was very high, exceeding one dollar per pound until the cultivation of the plant was commenced in Dalmatia

Extensive plantations were made in California in the eighties, in consequence of which the price of the powder in the United States fell suddenly to about 8 cents per pound It was soon discovered however that the cultivation of pyrethrum in California diminished its potency, and the price of the European product rose in consequence of a renewed demand from America

The best time to pluck the flowers is in the latter part of May when they are just opening and possess greater insecticidal power than in the fully expanded condition The flowers are bought by dealers who dry them obtaining one pound of dried from four pounds of fresh flowers Nine or ten tons of the dried flowers are annually exported from Montenegro Formerly they went almost exclusively to Trieste whence they were distributed to Venice Vienna Budapest and Berlin where they were pulverized In recent years an English firm in Podgoritsa has been endeavoring to capture the entire crop for a firm in New York This firm bought 5 tons in 1906 and 7 tons in 1907 The flowers destined for America go first to London where they are pulverized In consequence of this attempt to corner the market the price has risen from 26 to 49 cents per pound

For some purposes pyrethrum has been largely superseded by naphthalin, but pyrethrum powder is still employed extensively and effectively for the destruction of insects in the house and on the farm The Montenegrin product is the best, probably because of the dry and cloudless summers of Montenegro. Even the stalks of the Montenegrin plants are said to furnish as strong a powder as the flowers produced in other countries—Prometheus.

The Yellowstone and Other Western Trips

A VERY attractive variety of low-fare tours through the West and Northwest may be made this year, including tours through Yellowstone Park, a trip to the Alaska-Yukon-Pacific Exposition at Seattle, through Colorado and California. You will add greatly to the comfort of your journey by *insisting* that your railroad and sleeping car tickets read via the

Chicago
Milwaukee & St. Paul
Railway

A few of the numerous Western trips offered, together with railroad fare from Chicago, are shown below

Yellowstone Park Tours

$44 round trip from Chicago to Yellowstone Park, daily until September 22d Return limit, October 31st Choice of routes Fourteen different tours at various rates are offered through the park Stop-overs

Round Trip to Colorado

$30 round trip from Chicago to Denver, Colorado Springs or Pueblo, daily until September 30th Return limit, October 31st Choice of routes Stop-overs

Alaska-Yukon-Pacific Exposition

$62 round trip from Chicago to Seattle, daily until September 30th Return limit, October 31st Choice of routes Stop-overs

$62 round trip from Chicago to Tacoma, Spokane, Portland, Victoria, Vancouver, Butte and other points Same dates of sale, etc

To CALIFORNIA

$62.50 from Chicago to San Francisco, Los Angeles and San Diego, June 24th to July 10th and July 27th to August 6th

$72.50 round trip, daily until September 30th Return limit, October 31st Choice of routes Stop-overs

$62 for a combination trip through the West, as follows: Chicago to Seattle, via St Paul and Minneapolis, for the Exposition; stop over at Yellowstone Park; *returning* via Portland and through Colorado to Chicago via Omaha or Kansas City You may reverse these routes if desired. Cost of railroad ticket for this trip, **$62**, for the round trip

The Oil for Every Car

The cost of maintaining your automobile and the amount of service it gives you depend to a great extent on the use of the proper oil No matter what the make of your car its type or purpose, the right grade of Vacuum MOBILOIL will give it perfect lubrication at all times and under all conditions.

VACUUM

MOBILOIL

is made in six different grades. One of these grades is prepared especially for the perfect lubrication of your car By the use of this one grade you will save time and trouble and avoid expensive experiment.

Send for booklet listing every automobile made and the grade of MOBILOIL prepared for it. Thereafter you need only match the label on the can; the car will take care of itself The book is from the facts on the science of lubrication ar invaluable Gives track records to date, and other pertinent motor pointers.

MOBILOIL, in barrels and in cans with patent pouring spout, is sold by dealers everywhere Manufactured by

THE ELECTRIC LOCOMOTIVE OF THE FUTURE

The announcement has recently been made that the New Haven Railroad Company is about to extend its electric zone from Stamford to New Haven a distance of over forty miles It is understood that in all its essential features the same system will be employed as that which has now for nearly two years been in successful operation from Stamford to New York, and the announcement is taken to indicate that the bold experiment which the New Haven Company made in equipping its four track trunk line with an alternating current plant and overhead conductors transmitting current at 11 000 volts directly to the locomotives has proved to be thoroughly successful This important extension of the electric zone is particularly significant in view of the fact that contemporaneously with the change of power on the New Haven system the New York Central Road which uses the same terminal station at 42nd Street New York, equipped its own four track road with a direct-current system using 650-volt direct current and that the two roads have been operated side by side under practically identical conditions

Under each system alternating current of high tension is generated at a central power station On the New York Central line it is stepped down and converted into direct current in sub-stations On the New Haven road the transformers are carried upon the locomotives themselves, each of which therefore may be said to act as its own sub-station In the latter case there is the disadvantage that there is a great increase of weight in proportion to the power delivered to the axles This is shown by the fact that, whereas the New York Central locomotives can develop 2,200 horse-power for a weight of 102 tons the New Haven locomotives can develop only 1 000 horse power on 107 tons Consequently, it is necessary to employ two locomotives to make schedule express time with a New Haven express train of from eight to fourteen cars whereas a single New York Central locomotive can haul the same, and indeed an even larger number of cars and maintain the schedule

Because of the fact that the New York Central Company has not as yet extended its electric zone beyond High Bridge which is about seven miles from the 42nd Street terminal no opportunity has been afforded to test the behavior of the locomotives in hauling heavy trains over long distances, and the question has been raised as to whether they will be able to stand up to this service with the same regularity as has been shown by the New Haven locomotives, which have been regularly making the run of 35 miles to Stamford without developing any trouble in the way of overheating of the motors, etc.

Up to the present time neither company has shown any disposition to make public the details of the cost of operation Both have declared that in point of convenience and regularity of service the electric has shown a decided superiority over the steam service and it is conceivable that these advantages are such as to more than offset any increased cost due to the heavy initial outlay It is certainly significant that although the mechanical, electrical and indeed all the physical elements of the installations have been made public with surprising candor, absolutely no definite statement has been given out as to economy of operation It is to be hoped that, in the interests of electrical science and for the furtherance of this most important question of the electrification of steam railroads, the two companies concerned will consent at an early date to publish this eagerly awaited information.

DRYDOCKS FOR OUR BIGGEST BATTLESHIPS.

In raising the displacement of its battleships to 26,000 tons, the United States government has produced a ship which far exceeds the largest contemporary battleships built or building of any foreign navy, not even excluding Great Britain If the new vessels are constructed with a rapidity equal to that of the foreign navies, our navy will possess in the 'Wyoming" and her sister, at the time of their completion, the largest and most powerful battleships afloat.

This extraordinary increase in size brings with it some serious responsibilities, prominent among which is that of the provision of drydocks capable of accommodating these monster vessels, not merely when they are loaded to their full displacement but when, as the result of the terrific wounds which even a victorious 'Dreadnought" of the future is bound to receive the vessel may have sunk some six or seven feet below her maximum draft

The foreign governments, notably Great Britain and Germany are fully alive to the importance of this question Great Britain possesses on her eastern and southern coast eight drydocks which are available for ships of the Dreadnought' class, and four are in course of construction this estimate including both government docks and those owned by private shipyards. On the west coast there are six docks, making eighteen in all, whose depth and entrance width are sufficient to accommodate the largest battleships Germany has under construction or already completed twelve docks of the requisite capacity

In considering our own docking facilities it will be well first of all to state the dimensions of the 26 000-ton 'Wyoming" Her beam will be 93 feet 2½ inches, her draft on full load displacement slightly less than 30 feet and the length 566 feet. At the present time the depth of water over the sills of our largest dry docks would be sufficient to float the 'Wyoming' over the sill on her full load displacement only at high water and even then with but a slight margin to spare The navy yard docks that could accommodate her and their depth of water over sills are Portsmouth, 30 feet, Boston, 30 feet 7½ inches, New York, 33 feet 6 inches League Island Pa. 30 feet Charlestown, 34 feet, Mare Island 30 feet, Puget Sound, 30 feet, and the new Pearl Island dock, 35 feet depth at Hawaii To these must be added two private docks, one at Newport News and another at San Francisco, each with a depth of 30 feet The rest of the naval drydocks, seven in all, are either too narrow or shallow to admit the 'Wyoming" at full load draft The new docks which are now under construction or have lately been completed were originally designed to take a battleship of any size, but the dimensions of our ships have increased so rapidly that it becomes an interesting question as to what clearances of breadth and depth these docks would offer, if any, in docking the "Wyoming"

We understand that the Bureau of Yards and Docks has been endeavoring to keep pace with the work of the Bureau of Construction and Repair and that designs have been modified as far as possible to meet the new conditions The most important consideration is that of depth, since the injuries which a warship must suffer in an engagement will in all probability involve a certain amount of perforation of the hull and starting of seams, at or near the waterline, and the entrance of more or less water, involving a proportionate increase in the draft of the ship In a discussion of this subject, as affecting the British navy, our contemporary, Engineering, estimates that if the boiler rooms of one of the British "Dreadnoughts" of 20 000 tons displacement were flooded, her displacement would be increased about 2,500 tons and about five feet would be added to her draft, and if the engine room and side compartments were also flooded the draft would be increased seven feet above the original draft of 26 feet It is conceded to be possible that even the wings might be also flooded in addition to the engine and boiler rooms and the ship still remain afloat, in which case the displacement would be increased from 20,000 to 32,000 tons and the draft from 26 to 38 feet.

Now at her mean draft our own "Florida" draws 28½ feet, and at full load displacement about 30 feet. It is conceivable that at the close of a fierce engagement with a "Dreadnought" of her own power, whose guns were served by such well-trained crews as are *found in the navies of one or two of the leading naval* powers, the "Florida," even if victorious, might get back into harbor drawing 35 or 36 feet of water In this condition she would be barred from every one of the drydocks which we at present possess, and before she could be docked temporary cofferdams would have to be built and a part of the water pumped out.

It may be said in answer to this that it is useless to give to a drydock a greater depth than that of the entrance channels to the harbor or port in which it is located. The point would be well taken, if it were certain that the existing channel depths would be the depths for all time. As a matter of fact, the entrance channels of all of the important harbors of this country are certain to be continually deepened in response to the demands of navigation. The entrance channel to New York has been deepened from 32 to 40 feet; and in the construction of drydocks, whether for government or private yards, a due regard for the future should lead to the construction of all first-class drydocks with depths over sills and widths at entrances greater than the needs of the hour would seem to call for At the same time it is only just to the Bureau of Yards and Docks to state that our present drydock accommodations are fairly comparable with those of the other leading powers.

THE RAILWAYS OF THE WORLD.

America still continues, by a wide margin, to lead the world in the extent of its railway system. Out of a total of 594,867 miles of railroad in the whole world, 268,058 miles are located in North America. This is but little less than the total for the three continents of Europe, Asia, and Africa, Europe having 199,385 miles, Asia 56,294 miles, and Africa 18,519 miles, a total of 274,198 miles for the Old World. South America has a total of 34,911 miles, and Australasia of 17,700 miles of railroad, which added to the figures for North America, make a grand total for the New World of 320,669 miles.

The above figures form part of a report compiled by the Prussian Ministry of Public Works, for the year 1907, which shows that, compared with the previous year, the largest percentage of increase is that of 998 miles or 5 7 per cent in Africa, followed by 7,637 miles, an increase of 3 per cent, in North America, and 2,917 miles, representing an increase of 1½ per cent in Europe The greatest amount of construction in European countries was that in Russia, where 1 625 miles of new track were built, France was next with 431 miles and Germany built 411 miles. The largest additions in Asia were made in British India, where 909 miles were built, China coming next with 464 miles In South Africa, the largest addition was in British South Africa, where the mileage was increased 5¼ per cent by the addition of 352 miles.

During the decade from 1897 to 1907, there was extraordinary activity in the building of railroads throughout the world, 140,127 miles of new railroad being built in that time representing an increase of 23½ per cent The largest gain was in North America. The statistics of 85 per cent of the railroads owning the total mileage given above show that there is a total capital invested of nearly $42,000,000,000 If the same rate of cost has obtained in the railroads of which statistics were not available, the total outlay on railroads, from their inception to the present time, must be nearly $50,000,000,000 This would represent an investment of about $31.50 for each inhabitant of the globe at the present time.

THE DIRECTIVE SENSE OF BEES.

The directive sense which is possessed by bees is the object of researches made by M. Gaston Bonnier, of Paris, and he seems to prove that bees possess a special sense like that of carrier pigeons. Bees can fly for two miles from the hive and are then able to return after gathering their supply of honey Langstroth and others suppose that vision comes into play and that bees can see for a great distance and can also note objects on the way so as to find their path. Others, with Dadant, suppose that the bees are guided by the sense of smell, and that they can smell flowers at distances of 1½ miles. The author makes experiments to prove that bees can return to the hive without using either sight or odor As to sight, he takes bees to a distance of 1 2 miles from the hive, in a closed box. They always fly back to the hive when released The same is true when their eyes are covered, so that sight is not essential As regards odor, experiments seem to prove that bees perceive odors at only short distances. When a needle dipped in ether is brought near the head of the bee, it shows signs of perceiving the odor, but not so when the needle is placed back of him or near other organs. Besides, when the organs of smell (antennae) are removed entirely, the bees will return to the hive. M Bonnier makes the following experiment: At 600 feet from the hive he places a supply of syrup, and the bees soon find it, proceeding to and fro to the hive. Such bees he marks with green-colored powder. He then places a second supply of syrup at the same distance from the hive, but spaced at 30 feet from the former. Other bees are now engaged in the to and fro movement to this point, but these are not the same individuals as the green marked ones, who are still working on the first supply, and he marks these in red. We thus have two distinct sets of bees, and we see that they can distinguish two directions which form a very acute angle. We seem to have here a special directive sense which does not reside in the antennae, but probably in the cerebral ganglia. Other facts may be cited in evidence of the directive sense of bees.

ENGINEERING.

The important work of deepening the channel to the city of Baltimore has been so far completed, that there is a depth from the city to the sea, if we except the crossing of York's Spit at the mouth of Chesapeake Bay, of 35 feet, and a channel width of 600 feet. Opposite Fort McHenry the channel is to be widened out to provide an anchorage for ocean-going vessels.

The increasing precipitation of the rainy season is having its usual effect of reducing the amount of excavation on the Panama Canal The rainfall in April was 4.36 inches, in May it was 9.82 inches and the excavation fell from 3,454,649 cubic yards in the former to 2,896,095 cubic yards in the latter month There is an increase, however, in the total amount of concrete laid, which was 11,586 cubic yards in May as against 7,978 cubic yards in April

The average speed for the transatlantic passage is now within 0 12 knot of the 26-knot mark On June 21st, the "Mauretania" on her passage to the eastward passed Brow Head at 8 A. M, having made the passage from the Ambrose lightship, Sandy Hook, in 4 days, 17 hours, and 21 minutes The successive day s runs were 588, 606, 609, 608, and 524 miles. The total distance is 2,937 knots, and it was covered at an average hourly speed of 25 88 knots.

The new United States ships of the 'Dreadnought' type, among other novelties of construction will embody three electric passenger elevators. They will have a lift of a little over twenty feet, and they will be used mainly by the watch officers whose duty takes them from fireroom to fireroom The elevators are rendered necessary by the fact that there are no doors between firerooms on the new ships The first elevator to be used in the United States navy was installed on the hospital ship 'Solace" during the Spanish war

The worldwide falling off in business in 1908 made itself felt in the traffic through the Suez Canal During 1908 there passed through the canal 3,795 vessels of 13,633,283 tons net, a decrease of 472 vessels and 1,095,151 tons as compared with 1907 There was an increase in the size of the individual type of vessels, and the average time of passage, seventeen hours and twenty-four minutes, was the best that had been made in any year since the canal was opened

It is understood that a majority both of the Canadian and American Commissioners of the International Waterways Commission will recommend that a dam be built on the Niagara River, opposite Buffalo and Fort Erie, for the purpose of raising the level of Lake Erie. In the autumn of every year there is a fall of about two feet in the level of the lake This reduction of available navigation depth seriously affects the shipping interests, and with the increase in the size of vessels it is becoming a menace to navigation. The estimated cost of the dam is about $5,000,000

The growth in size of steamships and in the cost of labor and the materials of their construction has caused a great increase in the total cost of transatlantic steamships during the past decade Thus the 'Kaiser Wilhelm der Grosse," 1897, cost a little over $2,500 000, the "Oceanic," 1899, $3,000,000, the "Deutschland," 1900, $3,250 000, and the "Kaiser Wilhelm II," 1903, $4 000,000, while the estimated cost of the "Mauretania" is $6,750,000 The most fruitful cause of the increase in cost has been the effort in each ship to outdistance her predecessor in speed This has led to an increase in the engine power from 30,000 in the "Kaiser Wilhelm der Grosse" to 70,000 in the 'Mauretania."

An engineer who has recently made a tour of the waterways of the Middle West, to gather data relative to proposed waterway improvements, informs us that he was astonished to find what a large amount of freighting is done by individual storekeepers and smaller merchants in launches propelled by internal-combustion motors. The country storekeeper, living on the banks of rivers and canals, has found that he can ship his own freight from the wholesale dealer and distribute it to his retail customers by motor boat, at a cost far below that of any other available means of conveyance. There is in this fact a suggestion of future usefulness for abandoned canals in which the draft is limited.

Frequenters of the classic Battery Park at the southern end of Manhattan Island were forcibly reminded of the palmy days of "America" cup racing, when they saw a gang of Park Department riggers hoisting into position a new flagpole, which turned out to be nothing more nor less than the mast of the old cup defender "Constitution." The lower mast is built of steel and is, of course, hollow. Telescoping into this is the wooden topmast. The foot of the mast is bolted to a block of concrete, and the truck of the topmast from which the flag flies is about 165 feet above the sea wall. In the rigging of the mast Herreshoff tried a new system of double crosstrees. Breakages of the [illegible] were frequent, and he subsequently, in the "Reliance," returned to the old system of single crosstrees.

ELECTRICITY.

A novel grounding device is now in the market, which is made up of a number of double convex disks secured to a central rod of a conductive material The disks are non-metallic, but are formed of absorbent material which retains moisture The advantage of this grounding device is that it is not affected by acids or alkalis, so that it provides a permanent ground connection of high capacity When the device is placed in the ground a pailful of strong brine is poured over it and as the earth is filled in over the disks, more salt water is added so as to increase the conductivity of the surrounding earth

The recent agitation in the Southern States in favor of electric headlights on locomotives has led to the design of several very efficient turbo-generator sets of such design that they can be placed directly on the locomotive boiler and be driven by steam taken from the boiler A very compact outfit of this type was exhibited at the recent Master Car Builders and Master Mechanics' conventions in Atlantic City The turbine is of the impulse type, consisting of a single wheel, provided with re-entrant paths for the steam which receives nearly its total expansion at the nozzles. One model shown was directly connected to the headlight It supplied a current of 25 amperes at a tension of 30 volts.

A miner standing at the bottom of a shaft 2 500 feet below the surface of the ground in the Clear Creek district, Idaho, can carry on a telephonic conversation with Chicago, says the Electrical Review and Western Electrician However only a miner can telephone in such surroundings owing to the noise of the drills and other machinery in operation all about. The telephone instruments used in the mine are of special construction to protect them from dampness There is a regular telephone system connecting over one hundred mines in the Idaho Springs district all of which mines are tapped by an underground railway through which the telephone wires run

The first electric locomotive for the Detroit River tunnel has been completed This locomotive has a weight of 199 000 pounds It is of the articulated type It is provided with four motors each adapted to develop a tractive effort of 9 000 pounds at 12 miles per hour The maximum speed of the locomotive is 35 miles per hour It is provided with the multiple-unit type of control, the motors being so arranged that they may be operated four in series, four in parallel or two in series and two in parallel The system of control makes it possible to start a train so gradually that the motion is almost imperceptible This locomotive is one of six which have been ordered for the tunnel, and is designed for use in hauling both passenger and freight trains

As a substitute for large condensers using paper, glass, or mica for the dielectric, an electrolytic condenser has been devised which consists of aluminium electrodes immersed preferably in ammonium borate. Magnesium or tantalum electrodes can be used but aluminium is preferred because it is cheaper The current acting upon the metal causes it to be coated with a thin layer of oxide but this oxide is very porous, and in the pores a gas is formed which serves as a dielectric between the metal and the electrolyte. The resistance of this gaseous dielectric increases with the tension up to a certain critical point Experiments have been made with various electrolytes and it was found that the critical tension with sulphate of soda was 40 volts, permanganate of potassium 112 volts, bichromate of potassium 122 volts silicate of soda 415 volts, citrate of ammonia 470 volts borate of soda 460 volts, and citric acid 535 volts. The best effect was that of ammonium borate with a critical tension of 403 volts. There was quite a loss of current with tensions above 90 volts

One of the principal problems considered by the International Meteorological Conference in London last week was the question of wireless marine weather reports. Prof Willis L. Moore, representing the United States, urged the necessity of adopting regulations that will compel a ship beyond a certain tonnage to carry wireless instruments and operators and to take at noon Greenwich time a daily observation of the weather Observations received by a ship would be transmitted to other vessels so that by means of such relays the weather conditions over the entire ocean would in a few minutes reach the central meteorological offices in the United States England, France, Germany, and other interested nations. Forecasts could then be made and distributed to the vessels by wireless telegraphy It is believed that a universal system such as this would be a great factor in saving life and property both on land and at sea. The conference has adopted an international weather signal code. Heretofore American vessels have used flags by day and lights by night to convey storm warnings while other nations have used balls and cones. Now any one will be able to read the weather signals, no matter what his nationality may be.

SCIENCE.

According to a recent report of the biological survey of the Department of Agriculture, rats destroy annually $100 000,000 worth of American grain It is estimated that one rat will eat 60 cents worth of grain in a year while of oatmeal it will consume $1 80 worth Rat proof construction especially the use of concrete foundations is urged as well as some rational method of disposing of garbage and storing food

Prof. John A Brashear of Allegheny calls attention to a peculiarity of the solar eclipse of June 17th For a few seconds it was an annular eclipse then a total eclipse and finally an annular eclipse again Although we have records of annular eclipses for four hundred years and of total eclipses for thousands of years Prof Brashear maintains that this is perhaps the first occurrence of the kind

The excavation of the Menelaon, the reputed tomb of Menelaus and Helen has brought to light some interesting Mycenæan relics among them traces of frescoes fragments of pottery bronze and lead votive offerings beads double-headed axes terra-cotta objects and the like The Menelaon itself was probably built about 5 B C in other words, six hundred years later than the traditional period of Menelaus.

Dr William Tell Kudlich has brought to the notice of the Health Board of Hoboken N J a plan for exterminating the mosquito which consists in planting mosquito-ridden tracts with azolla The plant is a native of Africa It in a short time covers marshy land with a layer three inches thick thus both suffocating mosquito larva and preventing the living insects from depositing their eggs in the water The plant is said to have been used with some success in the German colonies of Africa

In a process recently patented in Germany for the regeneration of vulcanized India rubber fragments of old rubber are mixed with from one-tenth to one-fifth their weight of anilin and the mixture is heated until it becomes fluid The special advantage of the process is the comparatively small quantity of solvent required The regenerated rubber is said to be little inferior to new rubber in elasticity and other properties It can be vulcanized in the usual way and can afterward be regenerated again by the new process.

The danger of explosion of mixtures of air and combustible dust is well known Explosions of this character occur in flour mills and frequently in coal mines Mixtures of air and aluminium powder are very liable to explosion The combustion of aluminium powder produces a very high temperature On this fact is based the process of autogenous welding of iron rails which is known as aluminothermy Recently in a factory near Nuremberg where a metallic surface is given to paper by means of aluminium powder the breaking of the globe of an inclosed arc lamp (Liliput) caused an explosion which killed two men and wounded several others

Experiments were recently made in France on various preservatives of wood including carbonileum Avenarius carbonileum Lyon gas tar, microsol lysol antimony antigermine and hydrofluoric acid It was found that for spruce beech poplar oak, and Aleppo pine exposed to the atmosphere the best preservatives are certainly the carbonileums gas tar and microsol The other substances examined produced absolutely no effect These same preservatives (carbonileum gas tar and microsol) are also most efficacious for the preservation of wood in the confined hot air of mines Antimony and hydrofluoric acid are less effective

Formol has been recommended as a fly poison by several writers who have studied its action and the best method of using it It is necessary in order to obtain good results that the formol shall be swallowed by the insect hence the flies must be attracted to the poison by mixing with it an appetizing food and by spreading the mixture over a large surface Honey has given poor results The best mixture is that of formol with milk The best results are obtained by using a solution containing 15 per cent of the formaline of commerce 20 per cent of milk and 65 per cent of water, placed in large flat vessels Most of the dead flies fall not within the vessels but around them sometimes at a great distance

An international agreement is reported between England France and the United States upon a unit of candle-power of luminous intensity to be known as the international candle No change is made in France which adheres to the *bougie decimale* nominally one-twentieth of the violle or molten platinum standard, but actually 0 104 carcel In England whatever small change may have been actually involved is covered by specifications of the national pentane flame standard by reference to the amount of moisture in the air of the photometer room In America a reduction of 1 6 per cent in the standard of candle-power maintained at the Bureau of Standards will be involved a change capable of being observed only by trained photometrists.

THE GUAYULE RUBBER INDUSTRY

BY J E KIRKWOOD

The increasing demand for rubber in the various manufactures of the present time makes the business of its production one of the most important of modern enterprises Not only is the natural source of the supply eagerly sought and carefully guarded but efforts for the cultivation of rubber bearing plants are receiving attention in many parts of the world

The rubber of commerce is derived from a number of different plants in fact there are many plants of more or less importance from the standpoint of the quantity and quality of the article they produce Among those less generally known is a Mexican plant called *guayule* (pronounced *wy lee*) which is identified botanically as *Parthenium argentatum*

The guayule is a desert plant It thrives in those regions of relatively little rain throughout the northern half of Mexico and the neighboring areas of Texas It is a small shrub tree-like and rarely attains a height of four feet or a stem diameter of more than three inches Its leaves are small and of a silvery gray color whence its specific name *argentatum* The plant produces small yellowish green flower heads consisting of many minute florets only five of which in each head are capable of producing seeds and each of these only one

Most of the rubber of commerce is produced by plants having a milky juice or latex as it is called in which the gum is found The trees are tapped by cutting into or through the bark and the latex is collected as it flows down In the guayule plant no latex is produced and it must be subjected to an entirely different process to extract the rubber This article occurs in the form of minute microscopic granules deposited throughout the tissues of the stem branches and roots but especially in the bark of these organs If one will take a very thin section of the stem or branch and examine it under a lens he may see much of the tissue densely crowded with small dark colored granules In these granules deposited within the living cell is the source of the rubber to separate which requires a special process

Methods of extraction of guayule rubber differ Some obtain the rubber by trituration of the plant and a subsequent more or less mechanical process others by means of solvents separate the gum from tissues after grinding them But the details of the process are kept secret the public not being admitted to the factories which are surrounded by high walls with armed guards at the gates However several processes are described by Dr F Altamirano* in the Boletin de la Secretaria de Fomento of Mexico One of the methods consists in first crushing the plants by grinding them in a machine in which they are tumbled among hard stones until thoroughly pulverized and the gummy substance collects in lumps with a certain amount of woody tissue To isolate the gum this material is then boiled over steam in an iron vessel with a double bottom and the woody particles afterward strained out After this operation the mass is thrown into a tank of cold water again it is strained and boiled anew with caustic soda until the woody particles are fully separated and the gum is precipitated by chloride of calcium

Extra large guayule bush

The process of extraction of guayule rubber involves therefore the immediate destruction of the plant. The natives employed to collect the plants uproot them and take no pains to spare any part The bushes are then packed on the backs of burros and carried to some place for baling and shipment The cheapness of labor makes it feasible to transport the plants for considerable distance by pack train or wagon. Sometimes the load is carried for as much as forty miles from where the plant is gathered to the railway station such distances usually by wagon The cheapness of labor makes such operations profitable the wages of a peon being about thirty seven cents a day Mexican currency

The manufacture of rubber from guayule is an industry of only recent development The production of gum from this plant has been known from the middle of the eighteenth century The Indians were accustomed to make rubber balls by chewing out the gum from the bark If one takes a mouthful of the bark and thoroughly masticates it rejecting the fibrous particles he may soon obtain a small mass of rubber the size of a pea The rubber thus obtained is soft and sticky adhering to the skin as it is manipulated between the thumb and finger

For some time no effort was made to manufacture this rubber on a large scale In 1890 a German chemist first attempted to extract it in commercial quantities but a paying basis was not reached until some years later In 1905 according to consular reports the guayule rubber shipment from Durango amounted to $125 478 From Torreon in 1906 rubber was shipped to the value of $917 571 During the year ending in June 1908 there was shipped from the Durango consular district alone guayule rubber to the value of two and a quarter millions Since then the business has increased and is one of Mexico s most important industries at the present time Extensive tracts of land and millions of capital are involved in the enterprise The Continental Mexican Rubber Company of New York in addition to their large factory at Torreon acquired possession of the old Hacienda de Cedros in the northern part of the State of Zacatecas consisting of 2 500 000 acres valued especially for the growth of guayule which it supports The Madero brothers of Barras

(*Concluded on page 26*)

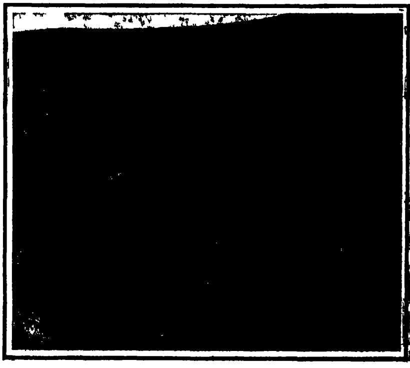
The guayule bush in the desert.



Bales of guayule ready for shipment.

Packing guayule into bales.

THE GUAYULE RUBBER INDUSTRY.

THE STANDARD ELECTRICAL CELL—ITS USE AND ITS PRACTICAL VALUE.

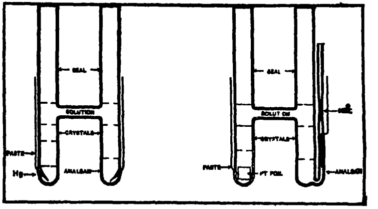
BY HERBERT T WADE

One of the most important lines of research in the field of electricity in recent years has had to do with the study of the standard cell from which is obtained a certain definite and constant electromotive force Indeed the standard cell practically underlies all measurements of electromotive force or difference of potential and its study and investigation have interested workers at the great national physical laboratories especially since the Clark cell was adopted as the standard of electromotive force in the definition of the volt by the Chicago Electrical Congress of 1893 To-day not only methods and results are compared by these national laboratories and bureaus but the very cells themselves are interchanged and a surprising degree of uniformity obtained on their comparison Now the standard cell in electrical measurements has the same function that a standard measure such as a scale or gage has in the shop and it must be used in the fundamental testing of a direct reading voltmeter and in other forms of laboratory work where accuracy in electrical measurement is essential While there are electrical units on the absolute system logically derived and inter-related and such practical units as the ampere volt and ohm yet it is just as difficult to reproduce and apply these units as it would be an inch or foot without recourse to some concrete standard

To realize the fundamental definitions and then to construct standards is a task requiring the most refined physical work but once the units are realized or known in terms of certain standards which may be reproduced readily and used in the laboratory accuracy of measurement follows without difficulty The standard cell enables us to define the volt as one of the fundamental units in addition to its general utility for electrical testing Various physicists and the investigators at the U S National Bureau of Standards have made a careful study of various types of these cells and it is their opinion that the standard cell has preponderating advantages over the coulometer as a fundamental standard However aside from this matter of defining the fundamental unit the present condition of the standard cell and its construction and testing present much that is of interest

The first standard cell or rather a constant cell in terms of which electromotive force was measured was the Daniell cell where zinc in a porous jar containing zinc-sulphate solution served as the anode while the cathode was copper in a solution of copper sulphate This cell was and is very useful as a constant source of current as in telegraphy having an E M F of about 1 1 volts but as a standard it was supplanted by the Clark cell devised by Latimer Clark in 1873

In its original form the Clark cell consisted of a test tube containing a mercury electrode covered with a paste made of mercurious sulphate zinc sulphate crystals and solution while above to form the second electrode was a rod of zinc in a saturated zinc sulphate solution and in contact with an excess of zinc sulphate crystals With an E M F taken as 1 434 volts at 15 deg C the Clark cell found wide usefulness and various improvements in the materials and form of construction resulted especially the evolution of the H type containing vessel and the substitution of zinc amalgam for the zinc rod due to Lord Rayleigh In 1893 the Chicago Electrical Congress adopted the Clark cell as a standard of electromotive force, and while international specifications for its construction never were prepared yet in the United States and in other countries legal specifications for making the cells were promulgated and the E M F was started at 1 434 volts at 15 deg C In the United States type a glass vessel in the shape of an inverted Y was prescribed in one limb of which was pure mercury and in the other an amalgam of zinc and mercury On the mercury was a layer of mercury and zinc sulphate paste above which as well as above the zinc amalgam was a layer of neutral zinc sulphate crystals and over all was a solution of zinc sulphate Somewhat different types of construction were adopted in different countries and in Germany the value of 1 4328 volts was adopted for the E M F which is nearer correct than the United States legal value Mention here should be made of the Weston cell brought out in 1892 which since has been widely used and studied both independently and in connection with the Clark cell In the Weston cell cadmium and cadmium sulphate replace the zinc and zinc sulphate of the Clark cell and the change of the E M F with temperature is so small as to be practically negligible For this and other points of advantage the Weston cell with its E M F of 1 1025 volts immediately found a place in the testing laboratory



Figs 1 and 2 Sectional views of standard cells

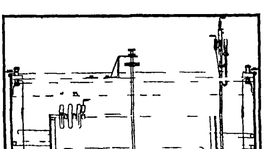


Fig. 3 —Sectional view of comparing bath.

Now while both of these cells could be made with ordinarily chemically pure" materials of sufficient accuracy for most ordinary work yet their permanence and durability as well as the limits of accuracy and reproducibility became a matter for investigation and this has continued with all the refinements possible in modern physical work The purity of the chemicals used has been determined beyond question and electrolytic and other methods have been used to obtain materials of absolute purity and uniformity even the size of the grain of the mercurious sulphate having received attention

The form of cell now made by the United States National Bureau of Standards is shown in the accompanying illustration Fig 1 a half-size diagram The size does not affect the E M F of the cell but it does determine its polarization and its power to assume quickly the temperature of its surroundings The lead wires are of platinum sealed into the tube and within are coated with a thin layer of glass to nearly the end Cracking at the point of sealing has always been a weak point with the Clark cell and this arrangement reduces the danger though the form of vessel serves equally well for the Clark and Weston cells

The Reichsanstalt or German Imperial Testing Laboratory recommends the form shown in Fig 2 in which the platinum terminal of the amalgam limb is sealed into a side tube into which the amalgam is sucked up while still liquid In a portable type of cell a piece of amalgamated platinum foil as shown in Fig 2 at the bottom of the left limb is welded to the platinum lead wire and replaces the mercury This type also has been extensively used by the Bureau of Standards The preparation of the chemicals and the construction of these cells involves the most painstaking care and the following of most detailed directions and of equal importance is their testing In the Clark cell especially the variation of the E M F with temperature requires special temperature regulating apparatus which enables the temperature of the oil bath in which the cells are placed to be maintained constant to within 0 01 deg C This is installed in a basement room of the Bureau of Standards where the temperature for the greater part of the year can be controlled automatically within 1 deg or 2 deg The illustration and diagram show the arrangement of the comparing baths and the regulating device which controls the temperature The various cells to be tested are immersed in the kerosene baths and their E M F is measured by the potentiometer method using a very accurate potentiometer of 10 000 ohms resistance and a sensitive galvanometer so that a difference of 0 00001 volt is plainly indicated on the scale In this arrangement a storage battery arranged across the terminals of the potentiometer provides a constant fall of potential Now by adjusting the coils of the potentiometer points can be found where there is no deflection of the galvanometer showing that the fall of potential of the standard cell is the same as that over a certain proportional part of the resistance of the potentiometer Both Clark and Weston cells thus were checked against each other and as a result of a large number of experiments and observations it was found that taking care that the mercurious sulphate was pure the remaining material of requisite quality could be obtained readily so that both types of cells are reproducible to within 2 or 3 parts in 100 000 These cells properly constructed gen

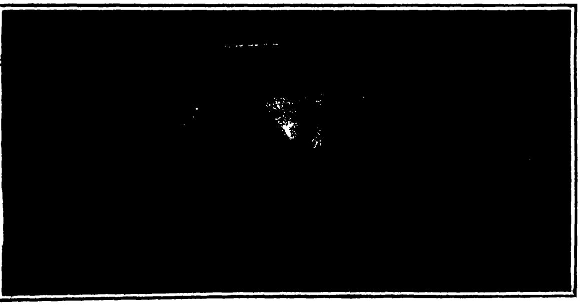

Fig 5 —Laboratory for studying standard cells.

THE STANDARD ELECTRICAL CELL—ITS USE AND ITS PRACTICAL VALUE.

erally reach a constant value within a few days and their E M F can be depended on within the above limits for at least a year

The investigators at Washington have studied not only their own cells made in various ways but also those of other investigators particularly those of the Reichsanstalt the National Physical Laboratory of Great Britain and the Laboratoire Centrale d Electricité comparison with the cells of these institutions having been made both in Europe and in Washington The conclusion was reached that standard cells could be set up by different investigators which will agree to within a few parts in 100 000 and that they can be constructed and carried considerable distances even on shipboard if ordinary precautions are observed

In the present condition of the standard cell the national laboratories can secure the desired accuracy and reproducibility and this extending in turn to the secondary standards must have its effect on electrical measurements If it is not feasible for the national laboratories and bureaus to construct these standard cells for ordinary testing or manufacturing laboratories it has been suggested that they might supply the materials of the requisite purity and thus obtain substantial harmony as the mere following of the specifications is not difficult while testing and certification by the Bureau would be a sufficient guarantee of accuracy The Weston cell which undoubtedly will be selected as an international standard of E M F at the coming congress though possibly without a legal numerical definition of its voltage to supplant the Clark cell of the present definition has now been demonstrated as a convenient standard and one easily reproducible with exactness It is for these reasons that many physicists especially those in America wish that the volt as defined by the standard cell should form with the ohm the two fundamental electrical units

◆

THE GUAYULE RUBBER INDUSTRY

(Concluded from page 24)

are said to own or control 3 000 000 acres of guayule lands and there are other large interests besides these

The rate of consumption of guayule is a subject of interest and importance With several well equipped factories in active operation working at least a part of the time both night and day the inroad upon the supply is a matter demanding consideration Although the acreage above cited seems large the fact is that only parts favored situations of these large holdings actually produce the plant the foothills especially of limestone formation A single factory may consume 30 000 tons of guayule shrub in a year or approximately 10 tons a day This may represent the growth on anywhere from [illegible] to 100 acres of land The number of plants on an acre and the weight of the individual plant vary so much that no constant figures can be given One may find on guayule lands a stand of from 1 000 to [illegible]000 plants to the acre and the plants weigh anywhere up to 15 pounds (very large) probably the majority of the plants taken weigh dry from 1 to 1 pounds Thus on an acre we should find from 1 000 to 8 000 pounds of the shrub If we call the average yield two tons per acre we may estimate the area harvested at fifty acres for one day's consumption at a large factory

While the fact is patent that the supply of guayule is decreasing and must ultimately be exhausted the opinions of experts place the date some at ten some at twenty years hence Large factories running steadily at Parras Torreon Saltillo and elsewhere using the product of no less than 100 acres every day the activities of the camps which the traveler may see in a dozen places in a day's journey the bales of the shrub piled high by the siding awaiting shipment all point to the speedily approaching day when the factories must shut down for want of material

This menace to the business interests involved has not been overlooked or ignored To provide a continuous crop upon which the business could depend is an idea that has appealed not only to the members of interested corporations but also to private land holders who appreciate the income prospective from such an enterprise Experiments here and there have been tried and various opinions have taken form as to the prospect The most notable of these experiments was that conducted at the instance of the Continental Mexican Rubber Company who recently established an elaborate department of investigation at Cedros Mexico and spent much money in forwarding the work Although less than a year was allowed for this large task the time sufficed to show some insuperable obstacles to the cultivation of the plant on anything like an economic scale

In the first place the slow production of seeds and the care required in their planting and the rearing of young plants make the procedure unprofitable from an economic standpoint With a possible germination rate of 10 per cent of the seed sown the failure through one cause or another of the young seedlings to pass the initial stages of development the ranks of the young plants again depleted by pest or parasite, the loss by accidents or in the process of transplanting, and a few subsequent vicissitudes both possible and probable make it doubtful whether one can count on as much as 1 per cent of the seed sown to mature plants even under the most favorable conditions Cuttings mostly fail to grow except from portions of the roots or stems having part of the root system in connection with them and only under certain conditions of irrigation even then as in the case of seedlings the cost of the operation exceeds its value Irrigation is quite essential to the starting either of seeds or cuttings and in the subsequent growth the rapidity of development depends upon the quantity of water supplied

But the rapidity of development is in inverse ratio to the formation of rubber in the tissues Plants grown under irrigation grow rapidly and attain in four years a weight of six pounds or more but the rubber content in such plants is practically *nil* while in native desert grown plants it is about 10 per cent of the dry weight If however water is withheld as under desert conditions the plants grow very slowly and it is doubtful whether a crop could be matured much under twenty years Of course rubber is present in desert grown plants at an age much less than this but it is a question at what age plants may be most profitably taken though certainly not in less than ten years

Reforestation by natural processes must be very slow and as in the case of the lumber forests of the North the second growth is never equal to the first A guayule seed in the desert has about one chance in ten thousand of coming up and thereafter danger from drought disease and accident make its hold upon life exceedingly uncertain The only hope of prolonging the business seems to be in so harvesting the plants that the roots are left in the ground from these new shoots will arise and in a few years possibly yield another crop worth the taking How long this process can be kept up profitably is at present unknown However the guayule rubber industry seems destined to have its day and pass out

The above statements are issued only after much observation and experiment the details of which are soon to be published in a book under the joint authorship of the investigators

◆

A 5 000 TON TESTING MACHINE

After the Quebec Bridge fell into the river it was found that the special member which gave way had failed under a load far below that which theoretically it should have carried The steel of which the bridge was built was of excellent quality and in the compression member which doubled up under its load there was sufficient steel for the purpose if it had only been assembled and braced together in the proper manner to develop its full strength The engineers who built the bridge believed that the box like form in which the plates of the bottom chord had been assembled and latticed together represented the strongest form of construction They believed that the latticing was quite sufficient to hold the deep webs or plates of the chord in true line and prevent just that very buckling which brought about the fall of the bridge

If we take a one inch cube of steel of the same quality say as that in the Quebec Bridge and subject it to compression in a testing machine it will begin to give way at a certain maximum load which represents the ultimate compressive strength of the material If we take another piece of the same steel one inch square and six inches long and subject it to compression in the direction of its longer axis failure will take place under a load less than that which was necessary to destroy the one inch cube Similarly if we take another specimen one inch square but twelve inches long there will be a still further decrease in the comparative compressive strength of the specimen As the length of the successive bars tested increases there will be a rapid decrease in their resistance failure taking place not as in the case of the cube by the actual crushing of the material but by the bending or bowing of the specimen away from its longitudinal axis If however as the length of the specimens is increased sufficient bracing be applied to prevent their bending from the straight line they will carry the same maximum load or nearly so as the first specimen measuring one inch on every side

Now in designing steel compression members, whether in the form of columns to support the walls of buildings or of posts or chords for steel bridges, an effort is made to so tie together the angles, plates etc of which they are composed that the steel will stand a compressive stress as near as possible to that which is necessary to crush a one-inch cube of the same steel Formulæ have been drawn up based upon tests to destruction of built up members of comparatively small size which are used in designing the big compression members that are too large to be placed in any existing testing machine All of the large bridges which have been built in this country during the past few years including the Quebec Bridge, have been designed by these formulæ which were formerly believed to give closely accurate results. Consequently, when the failure occurred at Quebec, it is not putting the case too strongly to say that it produced positive consternation among bridge builders, not only here but throughout the whole world. And although subsequent investigation of the bridge proved that it was overweight and that the latticing which failed was lighter and more openly distributed than in the judgment of many eminent engineers would be considered safe practice it is still a fact that if the commonly accepted theory of latticing was correct the bridge should not have gone down Hence there has risen a demand among bridge engineers for the construction of a machine large enough to take the biggest compression members and test them to absolute destruction It has come to be understood that only by this means will it be possible to draw up formulæ which will be absolutely reliable in the design of compression members of unusual size

Largely as the result of the agitation of this subject the United States Geological Survey is having built a mammoth testing machine which will have the large capacity of 5 000 tons. This powerful plant, which forms the subject of our front page engraving is now under construction for the Structural Materials Testing Laboratories of the Geological Survey by Olsen & Company of Philadelphia. The main purpose for which the machine is being built is the testing of large blocks of stone used for building purposes by the United States government It was also desired to obtain data regarding the strength of columns of brick concrete and structural steel Originally designed to take members 25 feet in length the machine is now being built to accommodate specimens up to 65 feet in length It will have a total weight of over 200 tons and its height above its foundation will be 80 feet. With a view to exhibiting its great proportions our artist has shown how the machine would appear if it were erected at the corner of Broadway and Vesey Street adjoining the southeast corner of the old Astor House which is shown in the illustration Although the machine has a total compression capacity of 5 000 tons it will not be capable of crushing to destruction a chord section of the Quebec Bridge or of the recently opened Queensboro Bridge in this city The drawings of these two sections have been introduced into the picture merely to show their huge proportions The Quebec Bridge section is shown adjoining St Paul's Churchyard and the Queensboro Bridge section is shown within the testing machine whose length is sufficient to include it

During the present Congress a bill was introduced but failed to pass authorizing the construction of a testing machine by A H Emery who built the celebrated 400 ton testing machine at Watertown Arsenal from which such great benefits have been derived This huge machine which will have a capacity in compression of 11 000 tons and in tension of 5 500 tons will be able to handle specimens one hundred feet in length Its total length will be 153 feet it will be 25 feet in width its weight will be about 3 500 tons and its cost would be $1 750 000 Had such a machine been in existence during the design and construction of the Quebec Bridge it is safe to say that the catastrophe would never have occurred

Returning now to the 5 000-ton Olsen machine as herewith illustrated the base contains a hydraulic cylinder or ram of 2 000 square inches cross-sectional area upon which is placed the lower platform From the four corners of the base extend four huge vertical screws each 13½ inches in diameter and 72 feet 2 inches in length At their upper extremities they pass through a massive upper head and are provided with four nuts which are operated simultaneously by means of gearing The maximum clearance between the upper and lower heads is 65 feet and the heads are each six feet square After the member to be tested has been placed on the lower head the upper head is brought down to a snug bearing on the top of the member and the pressure is then applied by means of a triple plunger pump connected to the main hydraulic cylinder in the base of the machine below the lower head, which to secure an even distribution of pressure, is provided with a ball-and socket bearing The determination of the pressure which is being applied to the member tested is arrived at by means of a set of standard levers upon which is weighed 1/80 of the total load on the main cylinder, the reduction being secured by means of a piston and diaphragm. The weighing beam is balanced by means of an automatically operated weight, and it is provided with a device by which counterweights of one million pounds each may be successively applied The machine will stand upon a foundation of concrete eight feet below the floor line, and the top of the machine will be about seventy two feet above the floor. The main hydraulic cylinder is fifty inches in diameter, and each of the 13½-inch main screws will weigh over twenty tons. The contract calls for an accuracy of at least one-third of one per cent for any load over fifty tons and up to the full capacity of 5,000 tons.

THE FOURTH DIMENSION SIMPLY EXPLAINED

THE FIRST HONORABLE MENTION ESSAY IN THE FOURTH DIMENSION COMPETITION

BY "[illegible]" (EDWARD H. CUTLER, NEWTON, MASS.)

[It was one of the conditions of the Fourth Dimension Competition that the editor of the SCIENTIFIC AMERICAN reserved the right to publish those essays which were considered worthy of honorable mention In accordance with that condition, the essay which in the opinion of the judges, Profs. S. A. Mitchell and H. P Manning, was deemed worthy of first place in the honorable mention class is here printed Prof Manning does not dissent for the most part from the conclusions of the author of the essay, but believes that the author has not quite fairly treated the arguments of the "fourth dimensionists." Prof. Manning will later offer some detailed criticism on this point.—ED.]

The fourth dimension has no real existence in the sense in which the external world that we know by means of our senses has real existence. It is a philosophical and metaphysical conception, whose actual existence cannot be demonstrated by observation or by logical reasoning. The existence of the fourth dimension is regarded by some as in a high degree probable, and as furnishing a basis for metaphysical investigation, and a means of explaining some physical phenomena, the occurrence of which, however, is not universally admitted. It may also, like any supposition, true or false, be made the hypothesis for mathematical speculations, which are comprehensible, however, by the very small and select number only who are endowed by nature with the ability to cope with original investigation in the domain of the higher mathematics.

The word "dimension" is more readily explained than defined. All more or less clearly conceive of space as extending indefinitely or infinitely in every direction, and of extension in space there are three "dimensions"—length, breadth, and thickness. Or, in another point of view, having three fixed points from which to reckon measurement, by three dimensions or measurements we can fix exactly the position of any point in space Thus, if the three fixed points be the center of the earth, one of the poles, and some other point on the surface, as the location of the Royal Astronomical Observatory at Greenwich the length of the line drawn from the center of the earth to the point in question in space, as a star, however remote, and the latitude and longitude of the point in which the line from the center intersects the surface, will be three dimensions, which fix exactly the position of the point in space, or of the star Or again, starting from any point in space, we may reach any other point by proceeding successively in three directions at right angles with one another Thus, moving from the starting point, first the proper distance east or west, then from the point arrived at the proper distance north or south, and finally the proper distance up or down, we reach the second point in question

In all the ways in which the meaning of the word is thus illustrated we see that we can have no fewer and no more than three dimensions, but the believers in a fourth dimension infer its existence from analogy in one of the following deductive processes

(1) Conceive, we are bidden of a space of but one dimension. A being in such a space would be limited to a straight line, which he would conceive as extending infinitely in both directions. His only possible movement would be along this line, and if he encountered another being, neither could pass the *other* If he is really within a space like ours, although his perception is confined to one direction only, and a being in our space should lift one of the two beings, and place him on the other side of the first, the latter would lose sight of the other as soon as the lifting took place, and the movement by which the change of position had been effected would be utterly unintelligible to him

Conceive of a space of but two dimensions like the flat surface of a table. Beings in such a space could move around one another, but one of them completely surrounded by others would be imprisoned by them. If, as before, the two-dimension space is within our space, and really depends on the limitation of the perceptive faculties of the beings in question the imprisoned being could be lifted by a being in our space, and set down outside of the beings surrounding him The latter would lose sight of him during this movement, and could not understand how it had been effected

From these suppositions of one-dimension space and two-dimension space, the inference is drawn that there may be a fourth dimension in our space, and that our ignorance of it arises only from the limitation of our perceptive faculties.

These suppositions, however, involve a fatal confusion of mathematical with physical conceptions. Mathematical lines and plane figures do not, like matter, occupy space, and they present no obstruction to the movements of one another They may freely intersect, or pass through one another, or coincide wholly or in part with one another If these [illegible] beings in one or two-dimensional space [illegible] obstruction to their movements, it must be [illegible] occupy space, and therefore are really in three-dimension space, however little they extend except in one or two directions. A line or a plane surface can be conceived only with space around it in every direction. The supposition of a one-dimension or a two-dimension space is therefore impossible except as a mathematical abstraction, and furnishes no basis for belief in a fourth dimension.

(2) The straight line, a one-dimension magnitude ends in points, the square a two-dimension magnitude, is bounded by straight lines, one-dimension magnitudes, the cube a three-dimension magnitude is bounded by squares, two-dimension magnitudes It is inferred by analogy that three-dimension magnitudes bound four-dimension magnitudes, although the latter are not known by us. Thus the "four-dimensional cube" receives a name, the 'tessaract," and is said to be bounded by cubes

But there is no such analogy as is here assumed All lines end in points, although some lines, like circular arcs, require two-dimensional space, and others, like a corkscrew curve, three-dimensional Nor are all two-dimensional figures bounded by straight lines The bounding lines *of circles and ellipses, for example*, require two-dimensional space, as much as the figures themselves. Still further, solids like spheres or egg-shaped bodies are bounded by three-dimension surfaces. There is, therefore, no regular progression which would lead us to suppose the existence of magnitudes bounded by solids. In fact such a supposition is inconceivable. The only possible boundary of a solid is a surface, whatever be the number of the dimensions of space.

(3) *In the series of the successive powers of a* number, a, a^2, a^3, a^4, a^n, a may be represented graphically by a straight line, of which a denotes the length, a^2, by a square, of which a denotes the length of a side, a^3, by a cube, of which a denotes the length of an edge. It is inferred that if we keep on there must be a magnitude corresponding with a^4, and so *on indefinitely up to* a^n Such magnitudes are incompatible with three-dimension space, and suggest for their possible existence 'spaces of higher order"

To those who have some elementary knowledge of analytical geometry or even of the use of graphs in algebra the origin of the conception of spaces of higher order may be presented in a different way As an equation containing two "variables" may be considered as representing the locus of a series of points in a plane so an equation with three variables is the locus of points in space, referred to three rectangular axes. But since, as shown above, in explaining the word 'dimension," three dimensions or co-ordinates fix definitely and exactly the position of a point equations with more than three variables transcend the scope of our geometry, and require for analogous interpretation spaces of more than three dimensions.

There is no objection to the hypothesis of spaces of a "higher order" as a purely mathematical conception, but this abstract supposition has no bearing on the number of dimensions of actual space as we know it.

(4) If we connect by a straight line the upper extremities of a capital V, we form what is called an isosceles triangle If we connect the middle point of our line with the bottom point of the V we have divided the *triangle into two* triangles which are plainly equal If we were confined to the two-dimensional surface of which the triangles are a portion we could never move them about so as to apply one to the other, and prove them equal by coincidence Not being under this restriction but being in three-dimension space, we turn one of the triangles a half *revolution on one of its sides* and then the two figures may be made to coincide Now there are many symmetrical solids for instance the two hands, which *can never be brought into identical shape* We cannot prove the left hand equal to the right by putting on the left the right hand glove But if we turn the right hand glove inside out it will fit the left hand Just as we can prove two-dimensional figures equal by availing ourselves of the possibilities presented by three-dimensional space it is inferred that in four-dimensional space, not only the glove, but the hand within it, might be turned inside out and made identical in shape with the other hand No explanation is offered of the way in which an additional dimension would render such a eversion possible, and if we could admit that it would do this we are not shown why the actual existence of a fourth dimension follows. Some four-dimension enthusiasts appear to believe that symmetrical forms in organic bodies could not originate without a fourth dimension, but no reason is given *for this belief*

The four numbered sections above include virtually all the lines of thought along which the effort is made to substantiate the existence of a fourth dimension Metaphysical considerations are sometimes added of the uncertainty and possible inaccuracy of our conception of space, but with no suggestion for correcting this inaccuracy, and *no argument* for the belief in a fourth dimension Admit that the mind must itself contribute an *a priori* element to all knowledge, and that the truth of things is not limited by the phenomenal apprehension of them it does not follow that this apprehension is to be assumed without demonstration to be false or incomplete In an investigation like the present one it is unnecessary to consider whether our conception of the *non ego* is subjective or objective we must accept the world of matter and of mind in which we live as our perceptions present it *to* us, and as it is generally conceived. No observation has ever discovered the existence of a fourth dimension in space and it may safely be said that there is no reason for believing in its existence

The theory of spaces of a higher order as developed in section (3) above is entirely legitimate as an abstract mathematical conception but furnishes no basis for the supposition of a fourth dimension in our space It virtually assumes space as we know it to be three-dimensional yet *from* a suggestion arising from this theory apparently (for no other origin for the assumption is to be found) the four dimensionists *have made* space as we know it a space of the highest order for the same analogies and inferences on which they depend would lead us to a fifth a sixth an nth dimension A fourth dimension belongs (or rather four dimensions belong) to the theoretical four-dimension space, but mathematics furnishes no basis for ascribing to our space more or fewer than three dimensions.

The confusion of thought of the four-dimensionists characterizes their writings on the subject The most thorough-going devotee of the fourth dimension asserts "There is nothing mysterious at all about it From every particle of matter there is a new direction, not connected with any of those which we know, but independent of all the paths we can draw in space and at right angles to them all" It would seem indisputable that a direction at right angles with *all* the paths or lines that we can draw in space from any point would produce lines coinciding with all the lines drawn from the point and therefore giving no 'new direction ' But we do not need to be convinced that there is no 'direction' from which we are cut off, and in which we cannot direct our perceptions.

The attempted analogies described in section (1) above are those on which the four-dimensionists chiefly depend, and they rely upon them to show that *a fourth dimension* would explain *how a body may* become invisible They assert that a body would disappear on 'entering the fourth dimension This expression is manifestly unintelligible Every body extends constantly in all the dimensions of space we cannot think of it as entering the dimension of length breadth or of thickness or of entering the fourth dimension if there were one But the disappearances produced as in section (1) depend wholly on removal from the limited perceptive faculties of the supposed observers but our normal perceptions are unrestricted in direction and extend to every point in space, unless cut off by distance or by an interposed physical obstruction If all the particles of a body moved in the new direction' of the imaginary fourth dimension the body would still retain its length breadth and thickness and would still remain within the range of our perceptions.

The assertion is made on the authority of eminent mathematicians that in space of four dimensions *there would be no obstruction to entering or emerging* from space shut in on every side as a tightly shut box or room and the fourth dimension is relied upon to explain supposed mysterious occurrences of such entrance or emergence The modification of physical laws in spaces of a higher order those of unusual mathematical ability alone can be expected *to understand* and in the special instance in question no explanation is vouchsafed Until such explanation is given, those who can make no claims to exceptional mathematical talent will be unable to believe it possible, in space of the fourth, or of any order to extract the contents of an egg or to pass an object within the egg and at the same time leave intact the continuous material structure that we call the shell But whatever may be possible in theoretical spaces of higher order we need not accept an unintelligible fourth dimension to aid in the explanation of something equally unintelligible

It may be said in conclusion that the only 'explanation of the fourth dimension *that can* reasonably be given, is to say that in the sense in which the expression is used, the fourth dimension is absolutely non-existent. It could have meaning only to designate the dimension in addition to the three that we know belonging to the imaginary mathematical hypothesis of four-dimension space The fourth dimension" has no relation *to the* actual universe in which our sensations and perceptions are exercised and belongs to that realm of thought to be entered only by the select *few* whose exceptional genius includes the development of the mathematical magination.

CARVING STATUES BY MEANS OF PHOTOGRAPHY

BY J. HAMMOND SMITH

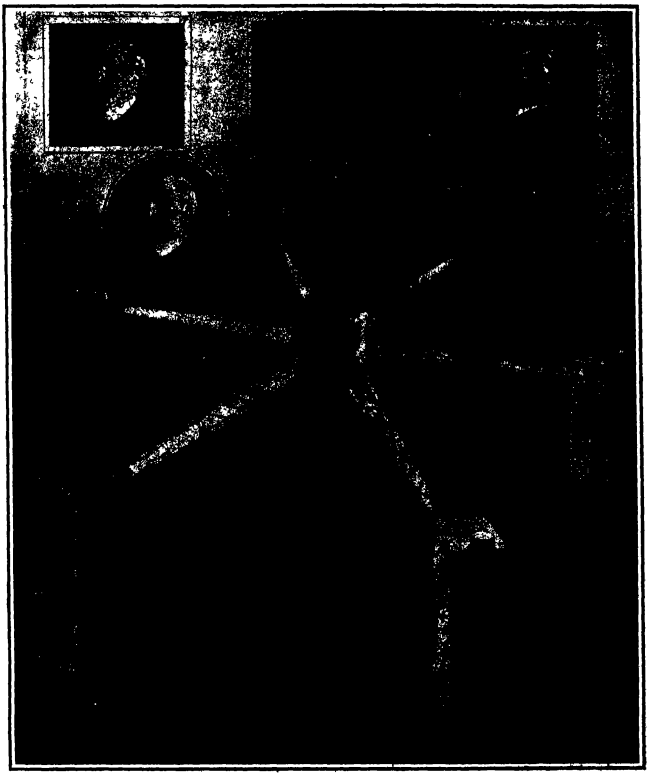
The device illustrated is intended for use in the production of all kinds of statuary, where it is possible to use the original as a model, or where it is possible to arrange a model after the original idea. Its principal use is in copying from life and existing statuary. It is especially useful where a likeness may be desired and where variation of relative sizes of the statue from the model may be necessary. For instance, a man may be used as a model and his exact likeness produced in a statue of any reasonable size, smaller or larger than the man himself.

The device is composed of combined cameras and projecting lanterns, which I call camera-projectors. These camera-projectors are located in suitable positions about and at variable distances from a common center where the model is located. In the illustration the camera-projectors are located in a horizontal plane about the central bust. These instruments are adjustable along radial lines. Other adjustable camera-projectors with their optical axes passing through the center may be located at any desirable points.

The plates on which the contours and dimensions are recorded, as well as the plates for the illumination of the finished statue, are obtained photographically as follows: Screens like the one shown in positive at the top of the engraving are placed in a number of the camera-projectors. Then all extraneous light is shut out and these used as lanterns to project images of the screen on the model, which is located at the center. The other camera-projectors are then used as cameras, in which photographic plates are exposed. Thus photographs of the model while illuminated with the screens are obtained. The screens are then removed from the lanterns, and the model illuminated by the lanterns or from some outside source, as flash light or daylight, and other photographs of the model still in the same position are taken, to be used in the illumination of the finished statue. These plates may be stored away in small space for any length of time and then brought out for the production of the statue of the model and its illumination.

The method of producing the statue, after the photographs have been taken, is as follows: After the plates have been developed and dried they are returned to their respective positions in the camera-projectors. Then the instruments are used only as projecting lanterns, and generally only two at a time. If the statue is to be smaller than the model, the instruments must be moved nearer the center; but if it is to be larger than the model, the instruments must be moved farther away from the center, the distance depending on the size of the statue desired.

The statue is built up or carved out by locating points by the intersection of light beams from the lantern with corresponding beams of the same marks or symbols of the screen, coming from the camera, which is now being used as a lantern. When the photographs were taken, certain marks on the screen were projected on the model by the lantern. These marks were photographed on the plates of the cameras. When these plates are developed, and replaced in the camera, and the camera used as a lantern, the same marks will be projected on a surface located in the same position as the model when the photographs were taken. Therefore if both instruments are used as lanterns, the two projections must coincide on a surface located as the model formerly was. For instance, suppose lantern 2 projects the letter *O* of its screen on the model. The letter *O* is reflected to camera 3, and the impression on the photographic plate is the letter *O*. Now with camera 3 used as a lantern, and with the developed negative in the same place as when the photograph was taken, an image in white, of the letter *O*, will be projected from 3, and will exactly cover the image in black of the letter *O* projected from 2. But it will be noticed that these two images will coincide only when the model, or a statue of the model, occupies the same position and space as was formerly occupied by the model when the photographs were taken. If this part of the surface of the statue is too far from the center, the black image of the letter *O* from 2 will appear to the right of the white image of the letter projected from 3. But if the surface is too near the center, the black image will appear on the left and the white image on the right. Therefore, in making the statue, corresponding images projected from the two instruments must be made to coincide, by building up or carving out the material of the statue. Lights of different colors may be used in the projecting instruments to heighten the contrast of the two images.



The dimensions of the model are recorded photographically on a plate or screen. The plate or screen is used to project these dimensions on a block of wood or stone. The sculptor carves away enough material so that the images projected from two cameras coincide.

CARVING STATUES BY MEANS OF PHOTOGRAPHY.

A set of negative plates (the original plates) may be used in all instruments in making statuary, or a complete set of positive plates may be used. In either case the black markings from either projection will be superimposed by the white markings from the other projection. The positive plates are found most convenient to use, on account of the positive image of the model thus obtained.

The finished statuary may be illuminated by simply using the camera-projectors as projecting lanterns, using slides made from the second set of negatives exposed while photographing the model. Instead of projecting the image of the model on a flat surface, as is ordinarily done, producing a flat picture, the image is projected on the statue at just the proper angle and distance to enhance the likeness of the statue to the original model. Thus a projected picture and a statue, both of which bear likeness to the original model, are combined, producing a likeness which cannot be attained by picture or statue alone. When a statue is to be illuminated in this way, a number of small projecting lanterns must be installed in the exhibit place, at the proper angle and distance with respect to the statue, to produce the proper illumination. These projecting lanterns must have the same optical arrangement as the standard camera-projectors used in making the statuary. They may be mounted in ornamental pendants, pedestals, walls, or columns.

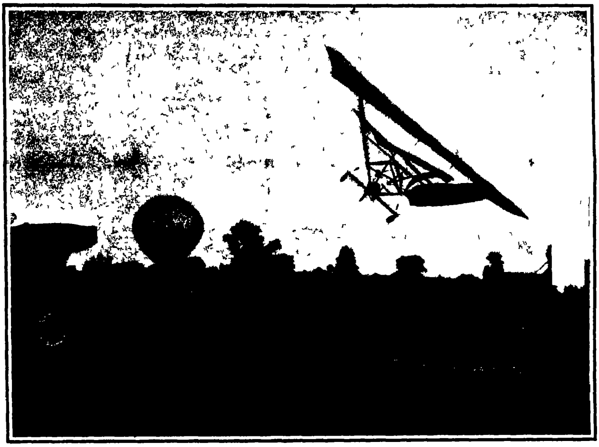
With the artificial illumination of the statue, which is a part of the system, a most natural and lifelike appearance is obtained. Thus two distinct effects are produced by the statuary, one effect in daylight as ordinary statuary, and another and entirely different effect when the illumination is produced artificially.

THE FIRST FLIGHT EXHIBITION AND TOURNAMENT OF THE AERONAUTIC SOCIETY

As noted in our last issue, the first opportunity to witness aeroplane flights in the vicinity of New York city was given the public on June 26th at Morris Park. Several very successful flights were made that day by Mr. Glenn H. Curtiss with the new biplane he has built for the Society, the longest of these being almost a complete circuit of the Morris Park race track in about 1½ minute. A half dozen other new aeroplanes, built by members of the Society, were exhibited, and one of these was shot off the catapult in an effort at flight.

Next to Curtiss's flights the most sensational feature was a towed flight in a glider made by Mr William H Martin of Canton, Ohio One of our illustrations shows this flight, while the other shows the flight made by Curtiss The glider was towed at too high a speed by the Kissel car employed for this purpose, the result being that it swayed violently, from side to side, tipping up as shown in the photograph, and finally crashing into the fence when the tow rope broke Fortunately, save for a sprained wrist, Mr Martin was uninjured He has repaired his glider and expects to try it again at the next meet on July 5th At the same time Mr Curtiss will attempt to set up a record for 1909 for the SCIENTIFIC AMERICAN Trophy—a record which, if unsurpassed this year, will entitle him to be declared the winner for the second time, and make it necessary for him to win it only once more to become the permanent holder

The fact that even those most skilled in the art will not attempt flight with an aeroplane as yet except under the most favorable conditions, was brought out by the failure of the Wright brothers to try their machine for the first time late in the afternoon of June 28th at Fort Myer, because a light breeze sprang up at the last moment. Congress had adjourned specially so that its members could witness a flight, and most of its members had been present at the Fort Myer parade ground all the afternoon, waiting in the broiling sun. It was a terrifically hot day, and when the breeze came it was welcomed by the spectators, but not by the Wrights, who refused to attempt a flight with their new machine save in an absolute calm The following two days only short flights of a few hundred yards were made, the engine developing insufficient power to make turns. Some damage was also sustained in alighting



Copyright 1909 by Edwin Levick

The Martin glider towed by an automobile at Morris Park.

The photograph shows the glider tilted to one side and swaying badly owing to the high speed at which it was being towed The rope broke and the glider crashed through the fence just after the picture was taken

The photograph was taken just before making the turn during the first circular flight on June 26th

THE FIRST FLIGHT EXHIBITION AND TOURNAMENT OF THE AERONAUTIC SOCIETY

The Current Supplement.

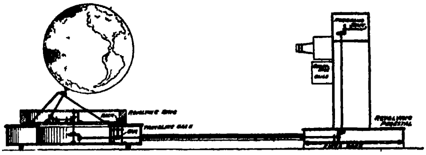
The opening article of the current SUPPLEMENT, No. 1749, gives a description of a novel railway testing machine. Col Sir Frederic L Nathan contributes an authoritative paper on guncotton and its manufacture Marine producer gas power is a subject very much in the engineering eye at present and is discussed by Mr C L. Straub Roger B Whitman of the New York School of Automobile Engineers has prepared a handy testing chart for automobilists which tells the chauffeur what to do when the engine stops A description is published of the casting of a colossal statue for the monument to King Victor Emmanuel II Wilhelm Krebs writes on how the earth looks from the moon supplementing his explanation with excellent drawings. S Frank Aaron contributes an instructive article *on cocoons* The sea carbon dioxide, and the duration of human life on the earth is the subject of an interesting article by J C Greggory

Ingenious men are continually contriving new kinds of shoes, new suspenders and hundreds of different kinds of braces but so far no one has taken up the idea of making a hat which will hold on the head and not blow off and at the same time not bind the head all around like a constricting band Some one ought to invent a hat which will prevent baldness Hundreds of remedies are on the market which are advertised as sure hair restoratives *but not one of* them will bring back one hair once the hair follicle is atrophied and functionless nor will any of these remedies prevent the falling of hair unless the habits of the sufferers are changed At best these remedies are merely skin irritants which promote a slightly increased flow of blood to the scalp Dandruff cures are mostly fakes The only good accomplished by these medicaments is the scalp massage indulged in while applying them, and the practitioner should make a fight against their use.—Dr T O Cobb, in the N Y Med Jour

A HUGE PLANETARIUM.

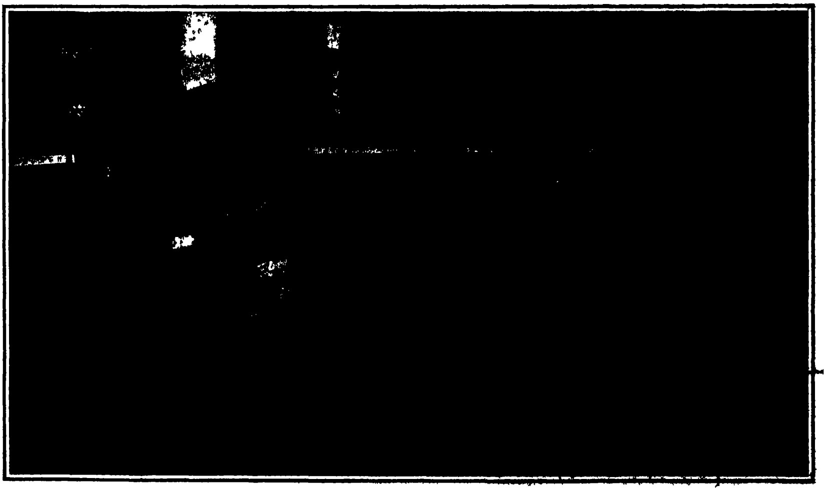
BY GEORGE SHERWOOD HODGINS

A wonderful object lesson on the movements of the earth may be had by any visitor at the American Museum of Natural History in New York. The relations of the earth and sun are represented by a model erected under the supervision of Dr H C Bumpus director of the museum The mechanical details have been very carefully worked out by Mr H F Beers an expert mechanician on the museum staff The globe representing the earth is about four feet in diameter made of paper and turning on its axis once in 24 hours The sun is represented by an electrically lighted stereopticon lamp of 3000 candle power which throws a divergent beam of white light upon the side of the globe turned toward it The lamp is placed on a revolving stand in the center of the hall and the 92 700 000 miles which separate earth and sun are here reduced to a distance of about 14 feet



Section through the planetarium

The light hollow paper sphere showing land and sea is carried on a steel shaft supported by an iron frame which rests upon a revolving wooden ring This ring, turning on a ball race rests on a traveling base mounted on castors which roll upon the floor The motive power for the miniature world is a Howard steeple clock such as is used in churches The clock is inclosed in a glass case the pendulum swinging in a cabinet below The cabinet stands on a circular wooden pedestal and like the revolving wooden ring below the globe the pedestal rotates on a ball race The clock cabinet also carries the stereopticon lamp so that lamp and clock rotate together on the fixed base The work done by the clock is probably less than that which would be required in moving the eight hands of a tower clock The minute hand shaft is not used and this clock steadily turns only the shaft usually employed to drive the hour hands As the globe is required to revolve but once in 24 hours a pair of gear wheels is interposed so that the hour hand shaft moves as it would for a clock having 24 hours shown on the dial.



THE GREAT PLANETARIUM OF THE AMERICAN MUSEUM OF NATURAL HISTORY.

No dial is used however and the slowly driven hour hand shaft terminates in a 45 deg bevel gear, just behind the lamp This bevel wheel meshes with a similar gear on the upper end of a vertical shaft which shaft therefore turns in unison with the hour hand shaft of the clock At the bottom of the vertical shaft a pair of 45 deg bevel gears transmit similar motion to a long horizontal shaft laid in the hollow of a 4 inch channel iron which connects the revolving pedestal of the clock with the traveling base below the globe In the center of the traveling base a third pair of 45-deg bevel gears give the motion of the horizontal shaft to a short upright shaft, and a fourth pair of 45-deg bevel gears at the top of the upright shaft transfer the motion to a short horizontal shaft All these shafts are carried on bicycle ball bearings The connection between the short horizontal shaft and the axis of the globe is made by a pair of specially cut bevel gears so that while the axis of the globe receives its motion from the clock, through the intermediate shafts and gears the specially cut bevel wheels preserve an angle of 23 deg 27 min from the vertical for the axis of the globe The complementary angle 66 deg 33 min at which the axis of our earth is inclined to the ecliptic or plane of its orbit about the sun is thus maintained The axis of the globe is placed like that of the earth so that it points toward the pole-star in the heavens The globe is therefore made to turn upon its axis once in 24 hours and with the same axial tilt as that of our planet and with its poles directed as are those of Mother Earth

The divergent beam of light from the lamp bathes one-half of the globe in bright light while the other is enveloped in the comparative gloom of the hall Thus the recurrence of day and night is made plain to the beholder The equator of the globe is divided into twenty four spaces with fractional divisions for half and quarter hours, and the shadow from a wire in front of the lens of the lamp draws a meridianal line upon the globe This shows the advance of high noon in the center of the illuminated surface, as the globe turns continuously from west to east, as does the earth During the time the earth is making one complete revolution on its axis, it is swinging on in its vast journey around the sun. The rate of this motion has been calculated by astronomers as about 18 miles a second

If the earth did not revolve around the sun, one complete axial revolution would be made in 23 hours and 56 minutes. In other words, the meridian passing through New York would be back again under the central beam of light from the sun in 4 minutes short of 24 hours and the corresponding meridian on the globe would coincide with the shadow line from the lens, in just that time. The earth, however, has in one day been carried forward more than a million miles in its path around the sun, and the meridian of New York is therefore behind the central beam from the sun by about 4 320 miles and 4 minutes more are required to bring this meridian under the central beam, indicated by the shadow line, and so completes one revolution which we call day and night. The period of 24 hours is called the solar day while the shorter period is the sidereal day

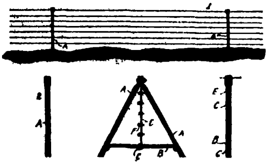
The constantly north-pointing direction of the earth's axis is also represented and maintained by the globe through a cleverly devised arrangement. On the underside of the revolving wooden ring below the globe a circular rack is fastened, and a suitably proportioned spur wheel gears with the rack. On the long horizontal shaft in the channel iron there is fixed a cam or dog, which revolves with the long shaft. The cam has one tooth, which engages with the spur wheel at every revolution of the long shaft The contact of cam and spur wheel gearing with the rack moves the wooden ring which supports the globe the distance necessary to preserve the position of the axis of the globe always pointing north

The requisite movement of the traveling base is made each day by the museum attendants The advance of the base represents the orbital motion of the earth in one day On the model this amounts to 2 inches All round the planetarium there is a protecting handrail On the inner face of the handrail a series of divisions is marked off each corresponding to a day The whole circle of the handrail approximately indicates the earth's path around the sun The top of the handrail is divided into 360 spaces representing the degrees of a circle. If there were only 360 days in the year, the divisions for days and degrees would correspond There are 365 days in the year and 360 deg in a circle The divisions representing the days are each smaller than the space occupied by a degree This slight discrepancy between each of them increases as the circle of the handrail is followed round At the end of the year the accumulated difference is practically equal to a quarter of a division representing a day, and thus the spectator has ocular demonstration of what leap year means, by the adding of one day to every fourth year.

Patent Department

PORTABLE METAL FENCE.

The growing scarcity of timber demands economy in its use, and the employment of substitutes for wood wherever possible. This is one of the reasons why wooden fences are giving way to metal constructions. Other and more potent reasons are because the metal fence is stronger, less liable to deteriorate, less cumbersome, and generally more ornate One of the latest constructions, which is very interesting, is pictured in the accompanying engraving This fence is unique in that it is portable. The fence posts are built up into an A-shaped form consisting of two side members *A* of metal tubing, which are flattened at their upper ends and bolted together, while their lower ends are spread apart by a member *B* A central plate *C* is fastened between the upper ends of the members *A* and is secured to the member *B* by means of a wire This plate *C* is provided with a number of openings *E* to receive the eyebolts *F* The fence wire is strung through these eyebolts, the uppermost wire resting on top of the plate *C* in the slot formed between the members *A* If desired, the eyebolts *F* may be dispensed with, and the wires can then be strung through the apertures *E* As the posts are merely set on the ground and not imbedded in it they may be moved to any desired position The inventor of this fence has called our attention to the fact that the ground on each side of an ordinary fixed fence becomes a breeding place for weeds, briers, and undesirable grasses, whose seeds ripen and are spread broadcast over the adjoining land The portable fence however may be moved to one side when the field is being plowed so that every foot of land may be cultivated Mr Calvin Wilson of 1004 Park Avenue Richmond, Va has secured a patent on this portable fence



PORTABLE METAL FENCE.

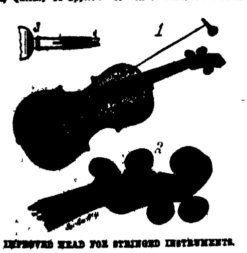
IMPROVED HEAD FOR STRINGED MUSICAL INSTRUMENTS.

The object of the improved head for stringed musical instruments which is pictured in the accompanying engraving is to enable the player to string the instrument when necessary without loss of time The pegs on which the strings are tightened may be removed from or replaced in the head without detaching the string and in case of a string breaking a new string may quickly be applied It will be observed that the head is in the form of a box with holes passing through the sides to receive the pegs, but notches are cut through the sides leading to alternate holes. The string is knotted at one end in the usual manner so that it may be readily caught in the tailpiece while the opposite end is fitted into a slot in the peg and is wound thereon The peg is seated in the head by inserting its inner end into the hole and lowering it bodily through the notch into the opposite hole. The string is then tightened until it has been properly tuned. Thereupon the peg is jammed into the hole so as to prevent it from turning It is the object of the inventor to provide a number of pegs each wrapped with a string so that in case of a string breaking the old peg may be lifted out of the head and the new string and peg inserted in its place. In this way the operation of replacing a string will consume a minimum time and will not seriously interrupt the playing, particularly in an orchestral production The actual time consumed in taking out a broken string, putting in a new one, and tuning it is 15 seconds. The operation can be performed in the dark The holes and the notches for the pegs are tapered to correspond with the taper of the peg so that when the latter is tightened to a sufficient degree and jammed into the hole it will be held in place with the requisite friction The construction does not limit the head to any particular form It may be made plain as in Fig 1 or with the usual fancy scroll as indicated in Fig 2 Mr Arthur S Leslie, of Sapperton, British Columbia Canada, is the inventor of this new form of head for musical instruments



IMPROVED HEAD FOR STRINGED INSTRUMENTS.

◆

New Use of Paper.

Germany manufactures annually 425 000 tons of paper, England 260 000 tons France 190 000 tons Austria 155 000 tons and Italy 120 000 tons. But the United States makes and uses more paper than all Europe, the annual production amounting to 1 330 000 tons. A French journal mentions the following novel uses of paper in America

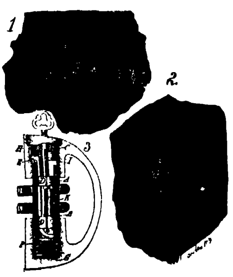
Roofs of paper and compressed wood pulp have proven successful A Chicago firm makes paper garments which are so light flexible and convenient that they are largely used in hospitals The paper is made of the bark of the paper mulberry tree and is tub-sized and finely craped Several sheets are superposed and sewn together The garments have narrow woolen bindings buttons, buttonholes and other fastenings Paper cigars are made by steeping paper pulp for ten days in a decoction of cigar clippings passing it between cylinders and rolling the sheets into the form of a cigar

Paper bottles and grain bags are made in Philadelphia. A recent invention is the paper horseshoe which according to the inventor is more durable as well as lighter than the iron shoe and eliminates all danger of injury to the hoof as it is attached not by nails but by cement Two German engineers have invented a sort of reinforced paper composed of paper pulp canvas linen and raw silk reinforced with steel wire The new material is light waterproof fireproof and suitable for the construction of vessels including warships automobiles and other vehicles for railways, street pavements and many other uses

◆

PADLOCK WITH INCASED BOLT

A padlock as commonly made offers but slight security against thieves. The lock itself may be of most elaborate construction so that it is well nigh impossible to pick it but that matters little when the door can be opened without touching the lock merely by filing or sawing off one of the screw eyes through which the bolt is passed The weakness of the padlock lies in the fact that the screw eyes and bolt are unprotected This weakness is very cleverly overcome in the lock herewith illustrated by having the casing of the lock extend over the bolt and screw eyes, completely inclosing them The casing is made in two forms, one for double doors which is of hemispheroidal shape (Fig 1) and the other for single doors, which has the form of a section of a sphere (Fig 2) The screw eyes with the bolt passing through them are shown in section in Fig 3 It will be observed that the casing fits very snugly against the doors and its form is such as to offer very little grip for a tool, should anyone attempt to force the lock The locking mechanism is contained in the bolt as shown in sectional view, Fig 3 The bolt comprises a cylindrical barrel *A* into which is fitted the sleeve *B*, the latter being formed with a head *C* through which the key is inserted Within the sleeve are the tumblers and locking dog mounted in a pair of heads *D* which are secured to a central stem The locking dog *E* is fulcrumed in the lower head *D*, and is provided with a curved extension against which the plate *F* is pressed by the coil spring *G* The spring *G* causes the upper end of the dog *E* to project through an opening in sleeve *B* and barrel *A* and to enter a recess in the casing of the lock, thereby retaining the bolt in the locked position To unlock the bolt it is necessary to turn the heads *D* within the sleeve *B*, so that the dog will be brought into register with the slot indicated by dotted lines at *H* and the spring *G* will then force out the sleeve with the mechanism it contains to the position shown in Fig 1 The bolt may then be drawn out by taking hold of the projecting sleeve The tumblers *I*, which are mounted to slide in heads *D*, enter bayonet slots in the sleeve *B*, and normally prevent the dog from turning until they have been forced down against the pressure of springs *K* sufficiently to enter the lateral extensions of the bayonet slots The barrel of the key is slotted so as to press the several tumblers to exactly the required extent. Then when the key is turned the tumblers and dog will be turned Any number of combinations may be had by changing the depth of the bayonet slots. If one so desires, he may change the combination of his own lock by taking out the tumblers from their seats within the heads *D* and transposing them from one position to another Of course in such a case a new key would be required so as to depress the tumblers to the proper degree The inventor of this improved padlock is Mr Raffaele Feola, 40 Stuyvesant Street, New York city



PADLOCK WITH INCASED BOLT

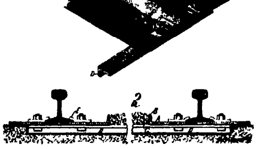
METAL RAIL BASE AND CROSS TIE FOR RAILWAY TRACKS.

Time was when railroad tracks consisted of wooden rails faced with a strip of sheet metal Such construction seems absurd to us now No doubt the time will come when our present track construction in which the rails are secured to wooden ties will seem as absurd The objections to wooden ties are many and have so often been referred to in these columns that it is not necessary to enumerate them now A substitute for the wooden tie construction is illustrated in the accompanying engraving The rails are laid on metal base plates indicated at *A* Each base plate is provided with a flange along its inner edge which is denoted by the letter *B* It will be observed that these base plates extend longitudinally under the rails and form a continuous support for them At frequent intervals the base plates are connected by means of cross ties *C* which are also provided with a flange along one edge This flange extends downward as indicated at *D* and is imbedded in the ballast of the roadbed so as to provide an anchor for the tie The rails are secured to the base plates and ties by means of clamps *E* which are fastened in place with bolts The upturned flanges *B* of the base plates afford abutments against which the ballast is packed Thus they guard against lateral movement or distortion of the track while the flanges *D* of the ties prevent longitudinal movement or creeping The flanges *D* also serve as guard rails to catch and retain the wheels of a derailed train or car The base plate provides a smooth surface for the derailed car obviating injury or shock which results from a car bumping over the ordinary ties The continuous bearing for the rails provided by the base plates prevents low joints with the resultant hammering which soon wears out the track Messrs Murray A Temple and Harry C Temple of Berlin Heights Ohio have just secured a patent on this tie construction



METAL RAIL BASE AND CROSS TIE FOR RAILWAY TRACKS

RECENTLY PATENTED INVENTIONS.

Electrical Devices.

AIR DRIER FOR STATIC ELECTRIC MACHINES.—M. R. Farrar, Greensboro, N. C. This drier for such static machines as the Holtz or Wimshurst type is designed with a special reference for this use and combined with the machine as an integral part thereof, whereby the moisture is eliminated from the air within the casing by condensation and congelation on a refrigerating receptacle over which the body of air from the casing is continuously circulated in an endless cycle by means of a fan.

Of Interest to Farmers.

AUTOMATIC COTTON TRAMPER.—R. H. Campbell, Blooming Grove, Texas. The aim in this invention is to produce a tramper having means for controlling the feeding of the lint through the same, so that when the compressing plunger is in its withdrawn position the feeding operation proceeds, but when the plunger is advancing the feeding operation ceases.

TRACK-CLEARER FOR MOWERS.—G. Braun, Duncan, Neb. The improvement has in view a device which will effectually throw the grass as it is cut from the standing grass completely within the swath cut by the mower and have a space on the outer side of the swath clear of cut grass in which the horse can walk and follow in the succeeding cut.

PEANUT PICKER AND STEMMER.—J. T. Benthall, Suffolk, Va. In this device the vines are fed into a hopper, are seized by disk fingers and become partially wedged in the throats between the fingers and the teeth. The portion wedged the tightest will draw the vine through the other throats, stripping the nuts and passing the vine to the next pair of disks. The nuts and leaves fall on a screen, the leaves and vine being blown out while the nuts pass to the stemming device, which removes the stems, and the nuts then pass into a conveyer, the trash being blown away.

Of General Interest.

FLOAT FOR LOGS.—W. I. Pierpont, Jr., Savannah, Ga. In operation the fastening pin or spike may be driven into the log or timber and the buoy body be then secured upon the pin, and when the log has reached its destination the float, including its fastening pin, may be withdrawn from the log, thus avoiding the use of any nails or other metallic fastening which may be broken off in the logs and injure saws or other tools used in working the logs.

SYSTEM FOR MINE VENTILATION.—D. Belloni, Edri, Ia. Mr. Belloni's invention relates to improvements in means for ventilating mines. It is especially applicable to the ventilation of coal mines in which noxious gases are liable to accumulate, but it is also applicable to any mine in which the removal of foul air is desirable.

COMPOSITION OF MATTER.—C. A. Goldsmith, York, Pa. The invention is a composition of matter designed for use in the treatment of smoking tobacco, and tobacco for use in making cigars, and the object is to provide a liquid for treating the tobacco for removing therefrom the musty odor and cellar smells and other foreign odors sometimes found in tobacco.

BOX.—P. H. Kraetsch, Astoria, Ore. The object of the invention is to provide a box provided with a plurality of compartments, for containing postcards, each of the compartments being independently removable from the box. The cards may be inspected without removing them from the tray, a notch permitting the lowermost card to be lifted from the bottom of the tray.

SIPHON.—S. J. Graham and A. F. Fowler, Trout Lake, British Columbia, Canada. The discharge leg of the siphon is provided with a valve such as to prevent the suction of air into the leg through its discharge end, but permits the passage of a fluid in the opposite direction, and an air pump having a connection with the siphon for exhausting the air therefrom. In connection with the siphon is a vent opening having a manually-operated valve by which the flow of the liquid may be easily controlled.

WINDOW.—I. Chevrenad, Omaha, Neb. By releasing a locking pin either of the window sashes may be rotated in its groove, whereby to open the top or bottom of the window, or to reverse the position of the sashes. In assembling the window the casement being in position, the front or upper sash is put in place and the parting strip is inserted and the lower sash is put in place. The inside rim is then placed in position and the annular ring or stop is secured in place by screws.

DOOR HANGER.—G. L. Schuyler, New York, N. Y. The invention is an improvement in door hangers and tracks for sliding doors, primarily such as include free and lineally movable roller bearings between the track and hanger, and has in view a hanger and track by which the door may have an increased travel over doors supported on tracks and hangers of the same working length as hitherto constructed.

ROLLER.—H. R. Derby, Jerseyville, Ill. The roller is suitable for pulverizing and smoothing the ground, the pulverizing taking place when the roller is moved one direction and smoothing when moved in the opposite direction. These two operations are performed by a single roller constructed with a series of disks independently revoluble, each disk having an approximately central rib with teeth projecting from each face of the rib, having radial or pulverizing faces at one side and rounded or inclined smoothing faces at the opposite side.

MOLD FOR MAKING FLUTED COLUMNS.—J. P. Archdeacon, Boston, Mass. The inventor provides a mold for making fluted columns of cement, plaster or other plastic material, the mold being arranged to permit of building the column at the intended place on a building or in a shop, and giving it the desired tapering form and producing the flutes on the exterior surface with gradually less depth and width according to the taper of the column.

LOCK FOR TOY BANKS.—C. Hansen, San Antonio, Texas. The invention relates to toy banks, and has for its object to provide a bank with a door to which is secured a receptacle which is adapted to contain camphor, menthol, or other similar substance which will gradually decrease in size when exposed to the air, there being a supported bolt on which there is a plate which is adapted to press against the contents of the box, and means provide for a pawl to slip off a bar when the door will be found to be unlocked.

FOLDABLE DISPLAY TRAY FOR MERCHANDISE.—F. R. Faulk and T. Beatt, Allegheny, Pa. The purpose here is to provide a construction used for exposure of seed packages or other merchandise in a prominent manner and that adapt the trays for close assembling in a suitable receptacle when the trays are not in use, or are to be shipped to different localities where the goods held in the trays are to be exposed for sale.

Household Utilities.

FIRE LIGHTING DEVICE.—J. Fero, Bellingham, Wash. The object here is to provide details of construction for a fire lighter which is controlled by the ordinary alarm mechanism of a portable alarm clock, and that will ignite fuel in the fire pot of a stove or range when the alarm is put in motion at the instant of time for which it was set.

Machines and Mechanical Devices.

COMPUTER.—C. A. Pitkin, Montpelier, Vt. The invention relates more particularly to that type of computer in which there are provided two relatively movable members, one of which carries a series of multipliers and the other of which carries a series of multiplicands and for each of the latter a series of products resulting from the use of each of the several multipliers.

EXHIBITING DEVICE.—E. W. Livermore, Bellingham, Wash. The object of this invention is to produce a device which is especially adapted for use in exhibiting fishes. The construction is such that the mounted fish will be presented to view within a glass jar and under water so that they resemble closely their natural appearance in life.

Prime Movers and Their Accessories.

ELASTIC FLUID TURBINE.—J. P. Nikonow, Evansville, Ind. The invention relates to turbines of the general kind used in connection with elastic fluids such as steam, compressed air or gases of combustion, the more particular purpose being to produce a device of this type having its parts so shaped and arranged as to be easily assembled, and in its complete form offering particular advantages as to replacement and interchangeability of parts.

Railways and Their Accessories.

RAILROAD TIE.—F. A. Buell, Norfolk, Va. The invention is an improvement particularly in metal ties. It provides a construction whereby rails may be securely held from spreading and will be cushioned, and the cushion will have its elasticity entirely confined within the tie and the rail can rise and fall without displacing the tie, thus permitting the rebound of the track without loosening the tie in its ballast or other seat.

RAILROAD-TRACK.—F. A. Buell, Norfolk, Va. The invention is an improvement in railroad tracks, particularly in the ties and the cushioning and fastening devices. The cushioning block of wood is confined in a recess and a metal cap which confines the cushion in the recess projects into the recess so that no portion of the cushion block is exposed and the elasticity of the block wholly available or fully utilized.

Pertaining to Vehicles.

WIND SHIELD.—J. B. Sprague, Norwalk, Ohio. The invention more particularly relates to improvements in the frame which supports the transparent section. One object is to provide improved means for connecting the lower portion of the frame with the dashboard or filler-board interposed between the wind shield and dashboard.

NOTE.—Copies of any of these patents will be furnished by Munn & Co. for ten cents each. Please state the name of the patentee, title of the invention, and date of this paper.

NEW BOOKS, ETC.

FACTORY ORGANIZATION AND COSTS. By J. Lee Nicholson. New York: Kohl Technical Publishing Company, 1909. Quarto, 410 pp. Price, $12.50.

This work is intended primarily as a handbook for manufacturers who are interested in modern methods of organization in systems of accounting, as a book of reference, and also as a text-book on cost accountings for the student. It requires a fully qualified accountant—be he private or certified—or a business engineer to deal with this most important subject. The author has a splendid grasp of the theory and technique of cost accounting. Critical examination of this book shows that not a single germane item of any description has been neglected or slighted in any way. The forms are given on a good scale, making it easy to compile forms adapted to the individual needs of the cost specialist. The book is beautifully gotten up and is a credit to both author and publisher. There are also chapters relating to office appliances, which are very full. If large concerns were aware of the savings that could be effected with the use of this machinery, they would not hesitate an hour to put in the necessary equipment. Many a firm has gone to the wall for the lack of statistics which an adding machine would have helped to turn out in a few days. One section of the book which strikes us as being particularly valuable is the distribution of indirect expenses, which is the bugbear of any one who attempts to analyze accounts.

EFFECTIVE MAGAZINE ADVERTISING. 508 Essays, About 111 Advertisements. Edited, with an Introduction to the Science of Advertising Copy, by Francis Bellamy. New York: Mitchell Kennerley, 1909. Large 8vo., 861 pages. Price, $5.

A couple of years ago Everybody's Magazine offered a series of prizes, ten in number, of $25 each, for the ten best essays in answer to the pertinent question, "Which is the most effective advertisement in this November issue of Everybody's Magazine?—and why?" The aim of this offer was to gain information which would be of value to the science of advertising in general and to the art of magazine advertising copy in particular. The people who are influenced by advertising are the only criterions of effective copy. The mere subjective theory on the part of the copy artificer is valueless, unless proved by the effect on the magazine reading public. In other words, the advertisements were "tried on the dog," and the "dog" responded in the 500 essays which are herewith presented, which were in turn selected out of some 900 essays. This book is a clarification of the advertising pages in the issue. The selected advertisements are well printed, and are accompanied by excellent essays written by individuals. It is remarkable to see what a hold advertising has on the American people, and it is little wonder that advertisers continue to spend their millions in periodical publicity when they can see that their efforts are appreciated by such a highly intelligent audience of readers and buyers. The book is a very novel one, and we can heartily commend it to all who are interested in any way in buying or selling advertising space.

HANDBUCH FÜR HEER UND FLOTTE. Enzyklopädie der Kriegswissenschaften und verwandter Gebiete. Herausgegeben von Georg von Alten, Generalleutnant z. D. Vollständig in 108 Lieferungen reichillustrierten Textes mit farbigen Beilagen, Karten, Plänen, Gefechtsskizzen etc. Deutsches Verlagshaus Bong & Co., 1909.

The last four installments of this handbook are primarily distinguished by the insertion of longer essays, which discuss the handling of troops. The essays are to be found under the headings *Angriff* (attack), *Angriff und Verteidigung* (attack and defense), and *Armeereserve* (army reserve). The author of these essays is a military instructor of repute, and evidently an authority. Many authors of note have covered important topics. Count von Beck, an Austrian general of infantry, has prepared an excellent biography of Archduke Albrecht of Austria, and has interestingly traced the career of this officer. The stirring events of 1866 are tactfully and yet ably discussed. General von Verny du Vernois outlines the generalship of Alexander the Great. The articles on "Algeria," "Tunis," "Arabia," and "Argentine Republic" ably discuss the military geography and military history of these foreign countries. The importance of the age of men, animals, and warships in their relation to military science is well brought out. Among the novel articles that deserve mention are those on "Amsterdam," "Anchor," "Antwerp." Under "Armament" an excellent discussion of the army and of warships will be found.

THE LIFE OF A FOSSIL HUNTER. By Charles H. Sternberg. New York: Henry Holt & Co., 1909. 12mo., 286 pages. Price, $1.60 net.

This is one of the "American Nature Series." This is a new and attractive series, the first volumes of which have already been published. The author is the oldest and best known of the explorers in the palæontological field, and he has contributed some of the finest specimens from Kansas, Texas, Oregon, and other places, which adorn the museums of America and Europe. It is a most interesting Monograph, bubbling full of adventure and representing a life of self-sacrifice worthy of record and recognition by all lovers of nature. It is handsomely bound and printed.

THE BIOGRAPHY OF A SILVER FOX. By Ernest Thompson Seton. With 100 illustrations by the author. New York: The Century Company, 1909.

Although Mr. Thompson Seton has been branded by a faunal naturalist now in foreign parts as a "nature fakir," it cannot be denied that he writes with sincerity and with charm. This little story of "the monogamy of the better class fox," to quote the author's words, may be regarded as a graceful narrative of animal life, the kind of narrative that has made Mr. Seton deservedly famous.

INDEX OF INVENTIONS

For which Letters Patent of the United States were Issued for the Week Ending June 29, 1909,

AND EACH BEARING THAT DATE

[See note at end of list about copies of these patents.]

Abrasive materials, flexible support for, C. H. Walties	[illegible]
Acetylene generator, J. H. Ross	926,610
Adding and listing machine, L. S. Crandall	926,219
Adding and subtracting machine, Brown & Burke	926,166
Adding machine, J. C. Vincent	926,151
Advertising device, automobile, Heales & Neall	926,188
Advertising device for paints, calcimines, etc., H. W. Pearson	926,498
Aerodrome, H. A. Orme	926,503
Aim recording apparatus, J. R. Rollitho	926,541
Air compressor, Lampman & Kittelberger	926,194
Air inlet, fresh, Levy & Young	926,708
Animal trap, T. H. Huggins	926,419
Apparel hanger, F. N. Kershaw	[illegible]
Ash pan and burner combined, J. F. Williams	926,581
Automobile top, folding or collapsible, H. M. Hoelscher	926,118
Automobile turn table, W. T. Coleman	[illegible]
Awning socket, J. Kennedy	926,190
Axles, spring buckle for securing springs to, P. Daimler	926,176
Barometric condenser, E. G. Helander	[illegible]
Barrel, W. W. Lytle	[illegible]
Barrel, D. Hughes	[illegible]
Barrel, Thomas & Pelegrin	[illegible]
Barrel, double-walled, A. H. Handlan, Jr.	[illegible]
Barrel hooping machine, J. Henry	[illegible]
Battery. See Storage battery.	
Battery plate, bifunctional storage, A. O. Tate	926,710
Battery plates, making, G. J. Miller	926,278
Bearing, ball, K. Schmidt	[illegible]
Bed and mattress therefor, convertible, L. B. Jeffcott	926,421
Bed, folding, L. B. Jeffcott	926,420
Bed, folding, J. Ranko	[illegible]
Bed pan, J. M. Crater	926,109
Bell ringer, A. O. Van Dervort	926,444
Belt fastener, F. O. Stenzel	926,616
Billiard tables, construction and mounting of, Terrey & Warren	926,516
Bin. See Grain bin.	
Block mold, J. D. Barber	[illegible]
Block signal for trolley systems, automatic, P. N. Pecci	[illegible]
Boat, sheet metal, G. H. Hyde	[illegible]
Boats, means for automatically releasing ships', R. Archibald	[illegible]
Boll weevil trap, J. M. & P. J. Coco	[illegible]
Bolt cutter, T. A. Hall	[illegible]
Boots and shoes, eyelet for, J. F. Chalk	[illegible]
Bottle capping machine, G. Kirkegaard	[illegible]
Bottle filling and capping machine, G. Kirkegaard	[illegible]
Bottle holder, E. O. D. Legg	[illegible]
Bottle, non-refillable, T. W. Leonard	[illegible]
Bottle or receptacle, collapsible, L. P. Brown	[illegible]
Bottle stopper, H. Goldstein	[illegible]
Bottle, etc., stoppering device, Jones & Braun	926,571
Bottle support and stopper puller, M. A. Gould	[illegible]
Bottling device, F. W. Dafoe	[illegible]
Box, J. Coleman	[illegible]
Box or carton, C. G. Palmer	[illegible]
Boxes, machine for applying fastening devices to, C. O. Mason	[illegible]
Bracelet, expansible, J. Bagnall	[illegible]
Braiding machines, movable racer of, W. N. Edwards	926,106
Brake apparatus, limit stop, A. Sundh	[illegible]
Brake beam, E. I. Dodds	[illegible]
Brake head, E. I. Dodds	[illegible]
Brake mechanism, A. Larson	[illegible]
Brake mechanism, G. E. Titcomb	[illegible]
Brush bank and connection, W. B. Blowers	[illegible]
Bucket, turbine, C. H. Rateel	[illegible]
Buckle, C. O. Anderson	[illegible]
Buggy top support, W. C. Putnam	[illegible]
Bulkhead doors, mechanism for operating water tight, H. M. Gleason	[illegible]
Buoy, acetylene gas, E. M. Dixon	[illegible]
Button, C. P. Talley	[illegible]
Button hook or fastener, E. B. Bayliss	[illegible]
Cabinet, card, C. E. Meleney	[illegible]
[illegible], H. D. Robinson	[illegible]
Camera, magazine plate holder for [illegible]	[illegible]
[illegible]	[illegible]
[illegible]	[illegible]

Cost of Industrial Insurance Further Reduced Voluntarily

By

The Prudential

Industrial policies now being issued have Increased Benefits, averaging over 10% and will

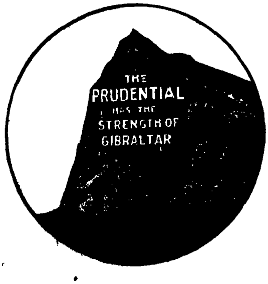
Give Many Millions of Dollars

of Life Insurance more than the old rates would have provided.

Over 20 Million Dollars

Extra Life Insurance has also been added voluntarily to Industrial Policies issued since January 1st, 1907, and in force July 1st, 1909, with no increase in Premiums.

This is the Greatest Benefit to Policyholders Ever Granted by The Prudential, Giving More Life Insurance for the Money than any similar Policy Ever Before Issued.



THE PRUDENTIAL HAS THE STRENGTH OF GIBRALTAR

You want the Best in Life Insurance at the Lowest Cost

Classified Advertisements

Advertising in this column is 75 cents a line. No less than four nor more than ten lines accepted. Count seven words to the line. All orders must be accompanied by a remittance. Further information sent on request.

READ THIS COLUMN CAREFULLY.—You will find inquiries for certain classes of articles numbered in consecutive order. If you manufacture these goods write us at once and we will send you the name and address of the party desiring the information. There is no charge for this service. In every case it is necessary to give the number of the inquiry. Where manufacturers do not respond promptly the inquiry may be repeated.

MUNN & CO.

PATENTS FOR SALE

FOR SALE. U. S. and Canadian patent No. 912,191. Adjustable standard and improved bolster for wagons. A leader. Manufacturers and wagon companies address C. M. Shotwell, Box 422, Kemmerer, Wyoming.

Inquiry No. 8868.—Wanted to buy nickeloid for buttons.

FOR SALE.—Patent No. 917,891. Rotary engine, compound expansion, continuous drive, reversible, cheap to manufacture, other advantages. For full particulars address Patentee, 3 Dorchester St., Montreal, Canada.

Inquiry No. 8901. Wanted to buy new or second hand machinery for making "bow type" mouse and rat trap springs and wire parts, single machine or full outfit.

FOR SALE

FOR SALE.—Specialty for manufacturers. Dental floss holder, patented May 1909. For further particulars apply direct to inventor, T. A. Tubbs, Seattle, Wash., care U. S. Emerson Company.

Inquiry No. 8908. For a dealer in tapes and cords for Venetian blinds.

PARTNERS WANTED

CAPITALIST OR PARTNER WANTED by the inventor of patent leak stopper for ocean ships. The object is to secure capital to pay for foreign patents. A grand opportunity. Address O. F., Box 773, New York.

Inquiry No. 8918. For manufacturers of "Wydt's Electro-Catalytic Sparking Plug."

HELP WANTED

MECHANICAL ENGINEER wanted for charge of designing and drafting office for large engineering works. Give experience. Address Canada Foundry Company, Ltd., 212 King St. West, Toronto, Canada.

WANTED—MISCELLANEOUS

ENAMEL PREPARATION for certain conditions for utilization on steel iron. Must be as represented. Send correspondence and samples prepaid to William R. Renick, 1217 Chestnut Street, Philadelphia, Pa.

Inquiry No. 8921. For the manufacturers of gilt paper.

WANTED. Customer heavy oak and Southern pine shavings. The Wm. J. Oliver Mfg. Co., Knoxville, Tenn.

Inquiry No. 8922.—Wanted the address of Worthington Boiler Co.

LISTS OF MANUFACTURERS

COMPLETE LISTS of manufacturers in all lines supplied at short notice at moderate rates. Small and special lists compiled to order at various prices. Estimates should be obtained in advance. Address Munn & Co., List Department, Box 773, New York.

Inquiry No. 8928. For the manufacturers of a steam rotary excavator as described in the Scientific American of December 19, 1908, page 447.

Inquiry No. 8931.—For parties who manufacture the Western Stump Borer for boring stumps.

Inquiry No. 8936.—Wanted machinery used to spin or wrap paper pencils in the manner that paper pencils are made.

A LIST OF 1,500 mining and consulting engineers on cards. A very valuable list for circularizing, etc. Price $15.00. Address Munn & Co., List Department, Box 773, New York.

Inquiry No. 8941. For manufacturers of machinery for making fly screens.

Inquiry No. 8957. Wanted manufacturers of angle bars either malleable steel or sheared.

Inquiry No. 8960. *For the address of the Windsor Mfg. Co., manufacturers of waterproof collars and cuffs.*

Inquiry No. 8966. Wanted the address of the Cubendet Motor Co.

Inquiry No. 8969.—Wanted machines that make accordion dress plaiting (steam).

Inquiry No. 8973. Wanted to buy complete outfit for making meat hooks.

Inquiry No. 8974. For address of firms interested in fishing reels.

Inquiry No. 8975.—Wanted the address of the builders of moving stair cases.

Inquiry No. 8977. For manufacturers of machinery for manufacturing denatured alcohol.

Inquiry No. 8978. Wanted the address of manufacturers of dry pans or crushers to grind sand for plastering and cement works.

Inquiry No. 8980. For the address of manufacturers of mortars and pestles that are used by druggists.

Inquiry No. 8982. Wanted a machine or process for slitting or laminating the edges of heavy cardboard, impregnating the slit or laminated edge with a waterproof material and compressing the edge after treatment. The object of the process is to produce an edge that shall be waterproof and which shall not fray or split when in use.

Inquiry No. 8984. Wanted the address of the manufacturers of Cypress wash tubs.

Inquiry No. 8986.—Wanted to buy crown and flint glasses for telescope objectives.

Inquiry No. 8987. Wanted the manufacturers of the Van Winkle Wood Y Sons, and the Weber power meters.

Inquiry No. 8989. Wanted a machine for making cocoa fiber mats.

Inquiry No. 8990. For information regarding shoes not made of leather but similar to the same and are as durable.

Inquiry No. 8991.—Wanted to communicate with manufacturers of large straw hats for every-day wear.

Inquiry No. 8993. Wanted to buy producer gas plants.

Inquiry No. 8994. For manufacturers of an apparatus to produce very high temperatures.

Inquiry No. 8995. *Wanted to buy round and oval glass paper weights, such as are used for mounting photographs.*

Inquiry No. 8996. Wanted addresses of manufacturers of machinery for working orange wood manicure sticks.

Inquiry No. 8997. Wanted the address of the manufacturers of bread or cake boxes.

Inquiry No. 8998. Wanted an automatic snap, ball and socket or other device which can be used easily and securely to fasten together the edges of small wooden boxes.

Inquiry No. 8999. For manufacturers of combined clothes and clothes pin receptacle.

Inquiry No. 9000. Wanted a combined appliance for holding hats, coats and umbrellas safely and securely.

And we can prove it. Anyone can operate it. Makes 6 finished button photographs a minute. Price of Camera-Scope, with supplies for making [illegible] pictures (enough to pay for the complete outfit) $25.00. Extra buttons $1 per hundred; extra frames $1.50 per gross. Be independent and make money for yourself. Write today.

W. S. MOUNTFORD, 100 Maiden Lane, New York, N.Y.

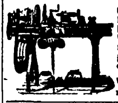
RUBBER STAMP MAKING.—THIS article describes a simple method of making rubber stamps with inexpensive apparatus. A thoroughly practical article written by an amateur who has had experience in rubber stamp making. One illustration. Contained in SUPPLEMENT 1110. Price 10 cents. For sale by Munn & Co. and all newsdealers.

Pipe Cutting and Threading Machine

For Either Hand or Power

This machine is the regular hand machine supplied with a power base, pinion, countershaft, etc., and can be worked as an ordinary power machine or taken from its base for use as a hand machine. Pipe ¼ in. to 15 in. diameter handled easily in small room. Illustrated catalogue—price list free on application.

THE CURTIS & CURTIS CO 6 Garden St., Bridgeport, Conn.



FOR GUNSMITHS, TOOL MAKERS, EXPERIMENTAL & REPAIR WORK, ETC

From 9-in. to 13-in. swing. Arranged for Steam or Foot Power, Velocipede or Stand-up Treadle. Send for Lathe Catalog.

Concrete Reinforced Concrete —AND— Concrete Building Blocks

Scientific American Supplement 1543 contains an article on Concrete, by Brysson Cunningham. The article clearly describes the proper composition and mixture of concrete and gives results of elaborate tests.

Scientific American Supplement 1538 gives the proportion of gravel and sand to be used in concrete.

Scientific American Supplements 1567, 1568, 1569, 1570, and 1571 contain an elaborate discussion by Lieut. Henry J. Jones of the various systems of reinforcing concrete, concrete construction, and their applications. These articles constitute a splendid text book on the subject of reinforced concrete. Nothing better has been published.

Scientific American Supplement 997 contains an article by Spencer Newberry in which practical notes on the proper preparation of concrete are given.

Scientific American Supplements 1568 and 1569 present a helpful account of the making of concrete blocks by Spencer Newberry.

Scientific American Supplement 1564 gives a critical review of the engineering value of reinforced concrete.

Scientific American Supplements 1547 and 1548 give a resume in which the various systems of reinforced concrete construction are discussed and illustrated.

Scientific American Supplement 1534 contains an article by Lewis A. Hicks, in which the merits and defects of reinforced concrete are analyzed.

Scientific American Supplement 1551 contains the principles of reinforced concrete with some practical illustrations by Walter Loring Webb.

Scientific American Supplement 1573 contains an article by Louis H. Gibson on the principles of success in concrete block manufacture, illustrated.

Scientific American Supplement 1574 discusses steel for reinforced concrete.

Scientific American Supplements 1575, 1576, and 1577 contain a paper by Philip L. Wormley, Jr., on cement mortar and concrete, their preparation and use for farm purposes. The paper exhaustively discusses the making of mortar and concrete, depositing of concrete, facing concrete, wood forms, concrete sidewalks, details of construction of reinforced concrete posts.

Each number of the Supplement costs 10 cents.

A set of papers containing all the articles here mentioned will be mailed for $1.80. Order from your newsdealer or from

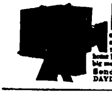
A printed copy of the specification and drawing of any patent in the foregoing list, or any patent in print issued since 1863, will be furnished from this office for 10 cents, provided the name and number of the patent desired and the date be given. Address Munn & Co., 361 Broadway, New York.

Canadian patents may now be obtained by the inventors for any of the inventions named in the foregoing list. For terms and further particulars address Munn & Co., 361 Broadway, New York.

The New Express Electric Blue Printer
OPERATING ON AN ENTIRELY NEW PRINCIPLE
Makes Blue Prints at 2 to 16 Running Feet Per Minute.
Handles two separate sets of Tracings, making two sets of Blue Prints or one set Blue Prints and one set Sepia Prints or Negatives at the same time. Four times the production of any other machine with greatest economy of Current. Lowest price continuous machine on the market. Write for circulars and lists of
Automatic Blue Print Washing and Drying Machines and Blue Print Coating and Measuring Machinery
WILLIAMS, BROWN & EARLE, Dept. 6, 918 Chestnut St., Philadelphia, Pa.



Have Fun and Make Money
operating a Daydark Photo Post Card Machine. 3 Photo Postal Cards of any object made and delivered on the spot in 10 minutes. No experience required—no dark room necessary. All work done in the machine in open day. Establish a profitable business at home by opening a Daydark Postal Parlor and big money maker on the street, at fairs, etc. Make Good Money.
Send at once for free catalog and sample post card showing fine work the machine does.
DAYDARK SPECIALTY COMPANY 904 A Temple Bldg. St. Louis, Mo.

Schools and Colleges
Rose Polytechnic Institute, Terre Haute, Indiana
A College of Engineering. Courses in Mechanical, Electrical, Civil and Chemical Engineering and Architecture. Extensive Shops, well equipped Laboratories in all departments. Expenses low. Twenty-sixth year. For Catalogue containing full information and professional register of alumni, address C. L. MEES, President.
Bliss Electrical School
20 Takoma Ave., Washington, D. C.
Offers a theoretical and practical course in ELECTRICITY, complete in one year. Students actually construct Dynamos, Motors, etc., and are trained for good positions in electrical industries. 17th year opens September 22. Send for Catalog.

YES MEN THERE IS A BETTER WAY

Try Our Way FREE

Give us your honest judgment on the **NEVER FAIL Perfect Stropper**. It has cost us five years to perfect it and the money was well spent because it has revolutionized the stropping problem.

You want one if this is true
Let US take the risk

We know that if we can prove to every Scientific American reader who shaves himself as he should do, that the **NEVER FAIL** will give a keener finer edge than he ever saw before **and will do it in four seconds** he will fight before he gives it up. Just send in the coupon below and the **NEVER FAIL** will go to you for ten days **Free Trial**, charges prepaid.

Then if you can't say with perfect truth: Never before have I enjoyed such shaves, SEND THE STROPPER RIGHT BACK

No. 1 For Safety Blades.
State in coupon what kind of blade you use

Turn your daily shaving task into a real pleasure. You can't go on scraping painfully at your face with ordinary razor edges and preserve that healthful well groomed look with which every gentleman should begin the day.

The **NEVER FAIL Perfect Stropper** is made for ordinary blades and every form of safety including the Clauss—whether single or double edged. Just tell us the style of blade you use, we will send the stropper wanted.

Every user of safety razors knows that mighty few—if any—of his blades are actually fit to use until they are stropped. The **NEVER FAIL** will make every one of them good for from 50 to 150 perfect shaves, so it pays for itself in money as well as time saved.

Send no money but send the coupon today
Don't miss one NEVER FAIL shave

Be sure to state in the coupon the kind of blade you use.

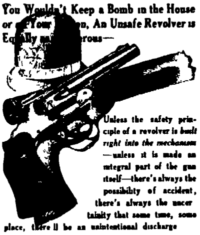
You Wouldn't Keep a Bomb in the House or [illegible] Your [illegible]n, An Unsafe Revolver is Equally dangerous—



Unless the safety principle of a revolver is *built right into the mechanism*—unless it is made an integral part of the gun itself—there's always the possibility of accident, there's always the uncertainty that some time, some place, there'll be an unintentional discharge

BUT IT'S DIFFERENT WITH THE

Hopkins & Allen TRIPLE ACTION SAFETY POLICE Revolver

You can see and feel the difference the minute you get this weapon in your hands. The Triple Action is the safety principle. It's the real and only *in built safety principle* just as the Hopkins & Allen Safety Police is the only triple action weapon in existence. Go to your dealer. Have him show you a Hopkins & Allen Triple Action Safety Police. You'll understand at a glance the advantages of its exclusive safety action.

Here's What the Triple Action Means The instant you pull the trigger the hammer [illegible], then first drives at the firing pin straight and hard; the second lifts the firing pin; the instant the shot is fired the third movement instantly lifts the hammer up and above the firing pin, *away above it*, out of all possible contact with the firing pin. There it lodges securely, safely—firm, fixed and immovable against a wall of solid steel. The weapon will not, cannot fire again unless you actually pull the trigger.

The New Army Grip gives a strong, firm hold and adds to the effectiveness of the revolver. 32 and 38 calibre, 4 inch barrel, nickeled finish, $9.50; blued finish, $10.00. For sale at all good hardware and sporting goods stores, but if your dealer does not have it, we will send one to you post-paid on receipt of price.

Send for our 1909 Gun Guide and Catalogue which also shows our other lines—the most complete range of high-grade, low price firearms made anywhere in the world. Write for it today. IT'S FREE.

LONGER DAYLIGHT.

There are a great many things to be said in favor of and a few against the proposal to advance the clock by one hour during the summer months Although the suggested change is startling there is in it nothing of the ludicrous or farcical as some of its critics have suggested The principal object of the movement is to apportion a larger part of the period of daylight to evening rest and recreation than is now possible in latitudes embraced by the United States Under present conditions the close of the working day is so near sunset that by the time the evening meal is over twilight has commenced and the stretch of remaining daylight is too short for any lengthy outdoor sports or pastimes of the kind which require daylight for their exercise

Those of us who have spent part of the summer months in northern latitudes where the later sunset and longer duration of twilight combine to make the summer evenings the most lengthy and delightful period of recreation understand perfectly well the motive and force of the arguments which have led to the present widespread movement in favor of what has popularly come to be known as a longer daylight day The evening is the ideal time for outdoor recreation The mind and body are relieved of the stress of the day s occupation and the cooler temperature which is a consideration even in the northern latitudes becomes of double importance in the more southerly regions where temperatures during the day run up to 90 or even 100 in the shade

The proposed arrangement as advocated by the National Daylight Association in this country is that from and after 2 o clock in the morning of the first day of May in each year until 2 o clock on the morning of the first day of October the standard time shall be one hour in advance of the standard time now in use This result is to be secured by advancing the hands of the clock one hour on May 1st and moving them back one hour on October 1st The change would involve a shortening of the hours of sleep only on the last day of April Subsequently through the summer months people would get up and retire by the clock as usual and the regular schedule of railroads factories and all social institutions would be maintained as before The only perceptible difference would be that instead of the twilight ending at from 9 to 9 30 it would last from 10 to 10 30 according to the latitude and the public would have the benefit of two or three hours of daylight after the evening meal instead of one or two hours as under the present arrangement

We cannot quite agree with the circular of the Daylight Association that no adjustment of railroad schedules would be necessary Some adjustment would obviously be needed on the two days which marked the opening and close of the longer daylight season but with those two exceptions regular schedules could be maintained without interruption during the 150 days or more of the late spring summer and early fall months

At the present time there is a bill before the British Parliament which provides for a change similar to that related above That the matter is being seriously regarded in that country is shown by the fact that it has the indorsement of the Education Committee of the London County Council of over one hundred municipal corporations and town councils of the National Convention of Royal Burghs of Scotland representing about two hundred towns and of one hundred and thirty chambers of commerce associations and clubs A similar bill is now before the Canadian Parliament and the report of the special committee to whom it was referred says that in view of the almost unanimous support in favor of the bill and that its object can be so easily attained, they consider that it should be put in force as soon as possible It is probable that a similar bill which has already received wide journalistic indorsement will be introduced in France.

SUBURBAN TRAFFIC IN LONDON AND NEW YORK.

Geographically considered the ideal conditions for the rapid inflow and outflow of the population of a great city to and from its business center are that the city shall be located inland and that the traffic movement shall not be obstructed by any natural topographical features such as are presented by the sea or wide and deep rivers or estuaries Judged by this standard London Paris and Berlin are admirably located whereas New York is at a great disadvantage In a diagram accompanying the last report of the London Traffic Branch of the Board of Trade the density of railway traffic and its distribution on the various suburban railways are very lucidly shown The diagram was drawn from statistics of the railroad companies of the number of passengers who entered the business center of London in the month of October 1907 from all stations within thirty miles of the city It includes the number of trips taken to the city by the season ticket holders The figures show that of the 9 743 669 persons who entered within a four mile radius of Charing Cross by railway in this month 8 071 78[illegible] or about 83 per cent came from localities not exceeding ten miles from Charing Cross 8 5 per cent entered from distances between ten and twelve miles and less than 8 5 per cent from distances lying between twelve and thirty miles from Charing Cross

An analysis of the table shows that 2 232 201 passengers came from the first zone which is from four to six miles distant from Charing Cross and that they averaged 35 784 passengers to the square mile that 3 406 588 passengers came from the six to eight mile zone and that the average was 39 7[illegible]9 passengers per square mile that 2 432 996 came from the eight to ten mile zone and averaged 21 512 passengers to the square mile From the ten to twelve mile zone the travel consisted of 843 780 passengers who averaged 6 104 to the square mile 331 413 averaging 792 to the square mile came from the fifteen to twenty mile zone and 107 614 averaging 124 to the square mile came from the twenty five to thirty mile zone

Turning now to the traffic problem in New York city we find that before the period of big bridges and tunnels Manhattan Island was most unfavorably situated for the rapid and comfortable handling of daily passenger traffic Shut off on one side by the sea and on two others by broad and deep rivers the city was denied those advantages accruing to large metropolitan cities in Europe from an inland situation which permit of the laying out of lines of railroad travel in every direction When the railroads radiate from the business center of a city as the spokes from the hub of a wheel the congestion of traffic decreases theoretically as the square of the distance from the center The figures quoted above for London show how quickly the outgoing crowds at night are disembarked from the trains over one half of the total of nine millions having left the cars by the time they have passed some six miles beyond the central zone In Manhattan however before the era of bridges and tunnels the greater part of the rush hour travel moved in parallel lines up and down a long and narrow island and many miles had to be covered before any relief was noticeable The intolerable congestion due to these conditions hastened the construction of the subway which was completed only just in time to save the transportation problem in New York from an absolute deadlock With the approaching completion of all of the eleven tunnels and three great bridges which have been built during the last decade and a half to connect Manhattan Island with New Jersey and Long Island New York city will be favored with the diverging system of transportation which characterizes London and other great cities of Europe The splendid facilities for comfortable and rapid travel to the vast suburban areas lying to the east and west of Manhattan are certain to act with a loosening up effect upon the present congestion of our elevated and subway lines of travel in Manhattan It will need only the construction of the Fourth Avenue line in Brooklyn with a tunnel beneath the Narrows to Staten Island to place New York city in practically as favorable a position for all round radial travel as London itself

INCONCLUSIVE TESTS OF THE SCOUT CRUISERS.

The possession by the United States navy of three scout cruisers the Birmingham "Chester and Salem absolutely identical in size and model but driven by three different types of engine presents an unrivaled opportunity for determining the relative all-round efficiency of the three types for naval purposes We are free to confess however that the tests which have already been carried out elaborate and costly though they have been, do not seem to be conclusive In fact the further the tests have gone the more bewildering do the results obtained appear.

It is absolutely necessary, if the data secured by such trials are to be of value that the conditions in the case of the three competitors shall be absolutely identical It was the intention of the Navy Department that they should be so, but unfortunately, with the exception of the government standardization trials at Rockland and the water-consumption trials made early in the year, there were certain disturbing elements, some accidental and others incidental to the conditions under which the tests were made and quite unavoidable which so greatly vitiated the results that they have lost their value.

Such facts as have been clearly established are a verification as far as the relative merits of reciprocating and turbine marine engines are concerned of previous results obtained with the two types At the lower speeds or what are known in the navy as cruising speeds the reciprocating engines of the Birmingham proved to be more economical but at the higher speeds and notably when the ships were driven under full power both the Parsons and the Curtis turbines showed a marked superiority in coal consumption, and drove their respective vessels at considerably higher maximum speeds As far as the published official figures show there is not much to choose between the two types of turbine sometimes one and sometimes the other showing a slight advantage in both the standardization and in the water-consumption trials.

It is when we come to the long-distance trials at sea that the confusion begins In the coal-consumption tests which were carried out a few months ago at the rate of 15 knots an hour the Birmingham showed a coal consumption of seventy-one tons the Chester" of eighty five tons and the Salem of one hundred and seven tons a day The disparity between the consumption of the Birmingham and the Chester was not unexpected but the consumption of the Salem was inexplicable At the conclusion of the trials the Salem returned to the builders yard and on opening the casing it was found that a loose bolt which had probably fallen by accident into the casing had bent over the edges of a large part of the blading thereby obstructing the passage of the steam and running up the coal consumption

Shortly after the conclusion of the trials the Chester and the Birmingham sailed for Liberia on the coast of Africa and after repairs had been made on the Salem she was dispatched to join the other two ships On the return trip the three scouts starting from Madeira steamed side by side for five consecutive days across the Atlantic All three were careful to maintain the same speed and everything was done to render this a fair five-day trial of the engines There was no attempt made to run at high speed and the average rate per hour for the five days was 13 8 knots The test has furnished the latest bewildering coal-consumption figures of the many which have been obtained with these vessels for the results of the first sea trials have now been completely reversed the Salem having burned an average of ninety five tons per day the Birmingham one hundred and ten tons and the Chester one hundred and thirty tons per day The explanation of the reversal of form on the Birmingham and Chester given by the officers of these ships is that while they were anchored off the coast of Liberia the bottoms of the ships became as they always will do in tropical waters very foul On the other hand it was explained by the officers of the Salem that while they were lying in the mud at the Quincy yard for repairs they were at a similar disadvantage

Now in the face of the above figures it seems that something must have gone wrong with the Chester s turbines a fact which will no doubt be determined as soon as she can get to a repair yard but the moral of these very bewildering results is that in view of the enormous importance of the turbine question the Navy Department should undertake a fresh series of trials of these three ships in which every care should be taken to render the conditions identical Moreover the trials should be of such a length and be carried on under such varying conditions, as to settle beyond all question of doubt which is the best type of drive to install in the future warships of the United States navy We do not hesitate to affirm that this is to-day the most important question affecting the physical characteristics of the ships of our navy Of the reliability of the turbine, whether it be the Parsons or Curtis type there is no doubt whatever and it is because of its reliability when driven for long periods of time at full power that it is vastly superior to the reciprocating engine for naval purposes. The question between the two types of turbine however is one of coal consumption and the question of coal consumption is intimately related to the question of radius of action, or total steaming distance, one of the most important elements in a warship. When two similar cruisers cross the Atlantic with a difference in coal consumption of over [illegible] per cent, it is clear that the demand for further examination into the range of efficiency of their turbines is well made.

ENGINEERING.

According to statistics furnished by the United States Forest Service, the art of wood preservation in this country during the year 1908 called for the use of 56,000,000 gallons of creosote, 19,000,000 pounds of zinc chloride, with small quantities of corrosive sublimate, crude oil, and other chemicals. Of the creosote, nearly seven-tenths was imported, most of it from England and Germany

The longest pipe line in the world is that which extends from the Oklahoma oil wells to New York harbor. At the present time the oil field of Oklahoma is the most active in the United States. It is not likely that the line will be put to immediate use for conveying oil over the whole distance. The completion of the system is regarded rather as a provision for emergency, and to meet the future conditions, when the Pennsylvania and West Virginia fields shall have been depleted.

The final dimensions of the great drydock which the United States navy is building at Pearl Harbor, in the Hawaiian Islands, show that the government is wisely building for the future. The dock will be 1,152 feet long from the coping to the outer sill, 140 feet wide at the top, and will have 35 feet of water over the entrance sill at mean high-water level There will be a sill at the middle of the dock, for an intermediate caisson which will divide it into two docks, 575 feet and 532 feet long respectively

On July 6th the United States Reclamation Service announced that the headings had met in the great Gunnison tunnel, which the government is building in western Colorado to carry the water of the Gunnison River into the Uncompahgre Valley, where it will be used for irrigation The tunnel, which will be cement lined throughout and will have a finished cross section of 10½ by 11½ feet, will be the largest underground waterway in the world It is six miles in length, and will carry thirteen hundred cubic feet of water per second Its cost will be over $2,500 000

On July 19th the twin tunnels extending beneath the Hudson River from the Pennsylvania Terminal Station in Jersey City to the Hudson Terminal Building in Manhattan, at Cortlandt Street, will be opened for operation Trains will run from a five-track station, eighty feet below the Pennsylvania Terminal, to a five-track loop station beneath the Terminal Building As soon as sufficient cars can be obtained from the builders, the twin tunnel, running parallel with the Hudson shore line on the Jersey side, and extending from the Pennsylvania to the Lackawanna terminals, will be also placed in operation

From every point of view the round-the-world cruise of the battleship fleet was a pronounced success, and the crowning indorsement of all has been the recent announcement of the Assistant Secretary of the Navy that the repairs to thirteen of the sixteen battleships that made the voyage have been completed at a total cost to the Engineering and the Equipment bureaus of $50,280, or less than $4,000 per ship Many were the predictions of trouble, damage, and even disaster, at the time of the starting of the fleet, but not one has been fulfilled On the contrary, the benefit to the navy in the increase of its physical efficiency and the improvement of its *morale* has been invaluable.

A test was recently made in England of a steam engine designed to work at pressures of as high as one thousand pounds per square inch. According to our contemporary, Engineering, the tests showed a steam economy of 13 5 pounds per brake horse-power per hour The engine is of the inverted V type, with eight cylinders, the high pressure two inches, low-pressure five inches in diameter, each pair being arranged in tandem on two cranks. The stroke is four inches, the speed, eight hundred revolutions per minute Forced lubrication is used, the oil being pumped into the steam on its way to the cylinders In the test the steam pressure was five hundred pounds, temperature 720 degrees, the revolutions seven hundred per minute, and the brake horse power developed 32.65

With a view to enabling marine turbine engine propellers to work at higher efficiency, Mr Yasuzo Wadagaki, in a paper before the Northeast Coast Institution of Engineers and Shipbuilders, proposes to use a metallic casing surrounding the screw propeller, the forward and aft ends of which are flared into bell-mouth shape, with a cross-sectional area gradually contracting from the two ends toward the screw propeller. By this arrangement the forward velocity of the water, which is imparted by the frictional pull of the ship's side, is accelerated, until at the most contracted part of the channel, where the water is acted upon by the screw propeller, the velocity rises to a maximum, the propeller operating "in water having a relative velocity much higher than the forward speed of the vessel." By this device Mr. Wadagaki believes the slip will be reduced and the screw propeller efficiency proportionately increased.

ELECTRICITY.

In a recent lecture before the Royal Institute, London, Prof. W. E. Dalby showed that for long distance traction at speeds under 55 miles per hour steam is much more economical than electric drive. Electricity possesses an advantage for high speed travel because the power is limited only by the number of axles to which motors may be applied

The largest electrically-controlled switch tower in the world has just been put into service at Providence, R I, on the New York, New Haven & Hartford Railroad The tower is equipped with 77 switch levers, providing 266 combinations. Elaborate precautions are furnished to prevent the giving of a wrong signal The power used is taken from the feed wires of the railway, but as a precaution two other sources of power are provided, which may be drawn upon in case of emergency

The old-style gasoline lights which have been used in Central Park are to be displaced with 1 400 or more than twice as many electric lamps. A very artistic lamp post has been designed for the new lamps. One of the objections to the gasoline lamps was the fact that the leakage of the oil ruined the grass around these lamp posts Furthermore the lamplighters did much damage by making short cuts through the flower beds along their routes from one lamp to an other

From time to time we hear of some enterprising amateur driving an electric generator by means of a windmill, and thus obtaining electricity without cost except that of the installation and with it lighting his house and operating various household machinery Recently a German company has gotten up a special electric generator equipment adapted to be operated by wind power The installation comprises a dynamo and a storage battery, the latter serving to store the excess power until such time as it is required The apparatus is entirely automatic, and requires absolutely no attention except in time of storm, when it is necessary to reduce the sail area of the wind wheel A special regulator used with this apparatus automatically keeps a constant pressure on the lighting circuit this being entirely independent of the number of revolutions of the dynamo or the condition of the storage battery

One of the large new steamers of the Orient Steam Navigation Company plying between England and Australia has been provided with a model electric equipment even including an electric laundry The wash is first boiled in a tank, where the water is kept at boiling point by means of steam pipes, thence it is carried to a pair of washing machines driven by an electric motor The clothing is dried by means of a hydro-extractor driven at 640 revolutions per minute by a 2 horse-power motor There is a Decoudon machine driven by an electric motor, which is provided with a safety device to prevent the operator's fingers from being caught under the rollers If the fingers come too near the roller, the motor which drives the machine is automatically stopped The laundry is equipped with an electrically-driven ironing machine and with several electric irons

Many hospitals in England are provided with a special apparatus for extracting iron and steel fragments from the eye by means of powerful electro magnets. The magnet employed has a core three feet long and six inches in diameter of the best Swedish soft iron Two hundred pounds of insulated wire are wound in two coils about the core The end of the magnet is threaded to receive terminals of different shapes to suit various conditions. The magnet is mounted on ball bearings and can be moved in any direction The strength of the magnetic field may be varied at will by means of a rheostat. When used at its maximum power, the magnet exerts a pull of 30 pounds per square inch at a distance of an inch A special type of apparatus is provided for reclining patients. In this case the magnet is mounted on trunnions, and is tilted by means of suitable gearing operated by a hand crank

A new form of electrical vacuum meter has recently been devised It possesses a distinct advantage over other electric vacuum meters in the fact that it requires no instrument for measuring the current resistance or intensity The device consists of a glass tube which communicates with the vessel in which the vacuum is formed A wire passes through this tube, and forms part of a circuit through which a current of constant pressure is fed At the center of the tube a small weight is attached to the wire The current passing through the wire heats it to a certain degree, dependent upon the intensity of the current, and also upon the amount of heat carried off by the gas surrounding the wire As the gas is rarefied it dissipates less and less of the heat, causing the temperature of the wire to rise. The increased temperature expands the wire, making it sag. The glass tube is graduated so that the extent of the sag may be observed, and thus the degree of rarefaction is determined.

SCIENCE.

A new parasite which attacks the vine at the root was discussed at the Académie des Sciences by M Guignard chief of the College of Pharmacy It is designated clandestine," as it is quite invisible in general, so that it is all the more dangerous The parasite is believed to be a fungus of the phanerogam family Experiments upon it are being continued at the biological laboratory of Nantes

The New York Aquarium has acquired an octopus after considerable expense and difficulty The specimen was captured in Bermuda waters and conveyed to this city in a large tugboat which was specially chartered for the purpose During the forty-eight-hour trip from Bermuda to New York seamen were kept busy pumping water into the tank which contained the octopus

The Smithsonian Institution of Washington will erect on the very summit of Mount Whitney Cal (altitude 14 500 feet) an observatory which will enable investigators to study atmospheric conditions at great elevations in dry air and in clear skies The observatory will be erected from the Hodgkins fund and will comprise a three-room structure of stone substantial enough to stand for centuries

Dr Osler has stated that the question of preserving the teeth is more important than the liquor question No doubt much dyspepsia is due to decayed and defective teeth which preclude complete mastication of the food (even if anybody in America had the time to eat properly) Dentists like doctors are now beginning to realize that their true mission is not a general rebuilding system but a systematic and well-considered effort to prevent and overcome the decay and loosening of human teeth

A French microscopist has devised a method of detecting and recognizing traces of blood on knife blades and other opaque objects even when the stains cannot be seen with the naked eye. The light of a Welsbach burner is concentrated upon the part of the object under examination through a tube which is placed obliquely above the object glass and which carries an iris diaphragm a condensing lens and a total reflection prism A photographic camera may be substituted for the eyepiece

The freedom from corrosion and other properties of tantalum suggested the employment of this metal as a material for pens but tantalum pens have failed to pass the test for durability which is applied (in France) to steel pens This test consists in loading the pen with a weight of 180 grammes (6 1/3 ounces) and moving a band of paper beneath and in contact with a pen at the ordinary speed of writing until 10 kilometers (6¼ miles) of paper have passed The loss in weight of the pen should not exceed 0 7 milligramme (0 0108 grain) The tantalum pens were found to lose more than twice this amount but the loss has been reduced to 0 8 milligramme (0 0123 grain) by slightly oxidizing the tantalum

A recent issue of the Gazette Astronomique of Antwerp announces that the great telescope of the Paris exposition of 1900 with two objectives visual and photographic 47¼ inches aperture a coelostat mirror 6½ feet in diameter and various accessories the whole costing more than $150 000 to construct is offered for sale by the receiver of the exposition On this announcement Cosmos which had vainly endeavored to find out what had become of the monster telescope makes two comments first, that the receiver has not been unduly precipitous in converting the assets into cash, and secondly that here is an exceptional opportunity to procure an extraordinary instrument probably for less than one-tenth of its cost as there will be few purchasers for a telescope which requires for its housing a building more than 130 feet long

A bulletin recently issued by the United States Department of Agriculture sets forth the results of a long series of experiments carried on by Dr Benedict and Mr Carpenter with the remarkable respiration calorimeter at Wesleyan University which in the hands of Atwater and Benedict has added so much to our knowledge of metabolism As a result of these investigations it seems that the human body is a machine of such wonderful efficiency that one fifth of the energy expended by it can be utilized as work and that this efficiency is more or less the same in men of all types The longest and most thorough training does not change this ratio The professional athlete, if he is able to outstrip the novice does so not because he has better muscles but because he is able to put more energy in the shape of tissue change into action Training besides preparing the heart to stand great strain acts to increase the subject's power of using up his tissue and by giving him more muscle tissue to use rather than by teaching him to conserve his energies In other words the professional has a more powerful engine because he is able to use more fuel and not because he wastes less steam, if we may employ a mechanical simile

AN ENGLISH ELECTRICALLY OPERATED EVAPORATIVE CONDENSER PLANT

BY FRANK C PERKINS

The accompanying illustration shows the construction of an English evaporative condenser constructed to do for the atmospheric condenser what the Contraflo does for the ordinary wet-surface condenser utilizing compartmental drainage This plant was installed to deal with 60 000 pounds of exhaust steam per hour and to maintain a vacuum of 25 inches under severe conditions there being no available water except from the city main

It will be noted from the illustration that the condenser is formed of two sections of pipes supported by a base of brick and concrete forming an enormous tank Each of the two groups or sections is divided into smaller sections collectors being placed at the end of the coils for separately draining them in such a way as to separate the water from the vapor The water of condensation then flows into a seal box and an electric motor driven pump carries a larger part of it away directly to the hot well while still at a high temperature

Sectional drainage is regulated to suit the load on the condenser in order to obtain at the same time both a high vacuum and a hot feed Care was taken in the design of the installation to prevent all the water of condensation from being drained from the pipe for in order to obtain efficient condensation of steam the effervescent action is necessary Valves are arranged so as to provide the adjustment of the sectional drainage to synchronise with the load and to secure a hot feed on light load as well as on peak load

A slow speed electric motor is utilized for driving each of the two sets of three cylinder air pumps In the same pump room are located two direct connected electric motor-driven centrifugal pumps for circulating the water over the condenser pipe

A HUGE EVAPORATIVE CONDENSER

A NEW ELECTRIC TRAVELING SCALE CRANE

BY WALTER BAILEY

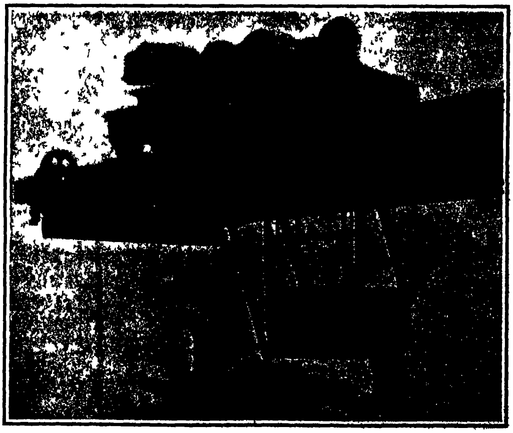
The accompanying illustration shows the construction and method of operation of a three motor electric traveling scale crane all movements of which are accomplished by electric power The scales are supported on a trolley truck frame and carry the hoisting mechanism on an independent steel framework while the scale beams are in the cage suspended from the trolley and readings are taken and recorded by the operator

It is of interest to note that the crane is provided with three beams two scale beams with several recording poises and one tare beam permitting the scale weights of several different items of material to be easily and accurately determined A movement of the hand lever transfers the load from the knife edges of the scale to the trolley truck frame when desired and the operation thereafter is the same as with an ordinary trolley

It will be seen that an open side platform is furnished for carrying long pieces such as bars and rods this platform being designed to suit the material to be handled The crane is adapted for weighing material when loading checking invoiced weights, and for loading for shipment as well as for inventory

The illustration shows a three-motor electric traveling scale crane fitted with alternating-current 3-phase 60-cycle 220-volt motor This construction is used in warehouses for handling freight, structural material, or any other class of goods of which the weight is desired The scale beams are so arranged that record of the weight of each piece can be made automatically

The scale mechanism can be thrown out of service and the carrying beam cast off so that the crane may be used as a standard traveling crane for general work



A NEW ELECTRIC TRAVELING SCALE CRANE.

"Speaking" Dynamos and Transformers

The human voice is perfectly transmitted a considerable distance by undulatory or induction currents produced by periodic alterations in the magnetism of a magnet Prof W Peukert of Brunswick Germany has tried to magnetize an iron core by currents of the kind produced when a microphone is spoken into To this effect he inserted a coil surrounding a closed bundle of soft iron wires in the circuit of a microphone The sounds pronounced in front of the microphone caused the iron core to vibrate slightly thereby rendering conversation with perfect distinctness though so feebly that the ear had to be brought close to the iron core.

It is well known that the permanent magnetism of iron under certain conditions is markedly influenced by feeble, variable magnetizing forces. This suggested the idea of subjecting the iron simultaneously to a constant magnetizing force With this object in view the core was surrounded by a second coil of wire energized by direct current. The iron core immediately began to give out intense sounds. In fact, by using a direct current of proper intensity, speech was so loudly reproduced as to be distinctly audible at a distance of several yards.

In another arrangement a coil and soft iron core were inserted between the poles of an electro magnet. Again a very intense and distinct reproduction of speech was produced The sound intensity in this case as well, depended mainly on the excitation of the electro magnet. A reproduction though of considerably less intensity, is also obtained when using a coil without iron core

These experiments having shown a considerable permanent magnetization to be the main factor, the substitution of a large steel magnet for the electro magnet was suggested. Accordingly a horse-shoe magnet, on a wound iron core, was used with excellent effect Speech was reproduced very distinctly By properly choosing the shape and dimensions of the various parts it thus was possible to obtain a novel telephone apparatus, remarkable for its simplicity and free from the disadvantages of vibrating plates or membranes. This telephone comprises a magnetic circuit as perfectly closed as possible whose ultimate particles partake in the oscillation insuring—because of the magnitude of the vibrating mass—a considerable sound intensity These effects can even be increased by using an acoustic funnel the whole system constituting an extremely simple loud-speaking telephone free from the upper harmonics that usually spoil the timbre

Similar experiments with equally satisfactory results were made on different alternating-current transformers Even a dynamo could be made to talk. The field magnets of the dynamo were excited from a special source of continuous current The microphone circuit being applied to the brushes the dynamo repeated with perfect distinctness the words pronounced in front of the microphone Speech and song were reproduced with equal clearness a small 500-watt shunt dynamo producing sounds distinctly heard throughout a hall of fair size

While large-sized machines show the same effect, the sound intensity of the reproduction by no means increases with the size of the machine, the microphone current undergoing no corresponding increase

It is doubtless an interesting physical phenomenon that the heavy iron masses used in connection with dynamos and transformers should be acted upon to such an extent by feeble microphone currents.

The government commission appointed to regulate the Russian platinum industry has, in conjunction with representatives of that industry drawn up a scheme for the formation of a compulsory syndicate. In connection with this scheme, the exportation of unrefined platinum is to be prohibited, its production is to be regulated by law, and credit is to be allowed on platinum by the State Treasury until the export trade in that article to foreign countries shall have become more favorable.

Wireless Telegraphy and Meteorology.

Dr. Polis, the director of the meteorological observatory at Aix la Chapelle, visited the United States in 1907 and, having become convinced in Washington of the reliability of regular wireless communication between vessels, instituted, in the course of his return voyage, experiments which demonstrated the feasibility of transmitting weather indications from ship to ship in this way. The coast wireless stations which are most important for communication with vessels navigating the Atlantic Ocean are those of the English Channel, the west coast of Ireland and the eastern shores of the United States and Canada. Several of these stations can make themselves understood to a distance of 2,000 miles, so that vessels can receive intelligence from land during the entire voyage across the Atlantic. The wireless transmitters on shipboard, however are much less powerful Their radius of action never exceeds 500 miles, and they cannot send messages directly to land from a greater distance than this.

During the summer of 1908 Dr Polis made an experimental voyage across the Atlantic and back, on the Hamburg steamer "Kaiserin Auguste Victoria." He had arranged with several steamship companies to take part in the experiments, and from their vessels he received 25 wireless messages on the outward and 19 on the return passage.

In addition, the Aix la Chapelle observatory sent him, *via* the wireless station at Clifden, Ireland, daily reports of meteorological observations made on the English and French coasts. The transmission was perfectly successful up to the end of the fourth day of the outward voyage, when the ship was about 2,000 miles from the Irish coast. The messages, which were in cipher, were transmitted without a single error

When the ship came within the zone of influence of the American stations, it received daily reports from the Weather Bureau at Washington These reports were transmitted more rapidly than those from Aix la Chapelle, but they were often curtailed, a fact which was attributed to the employment of code words instead of ciphers.

Conversely, meteorological observations made on the ship were sent out daily by wireless, for transmission to Aix la Chapelle. During the first two days of the westward voyage these messages were received directly by the wireless stations on the English Channel Afterward, the messages were transmitted indirectly through vessels nearer shore This system was employed until the ship was in mid-ocean and the transmission of the message to Aix occupied two full days. The messages sent directly on the return trip reached Aix in less than 13 hours—one of them in one hour and forty minutes

Daily weather charts were drawn from the reports received from land in combination with observations made on board. A German commission has since been appointed for the purpose of conducting a more extensive series of experiments.

Collaboration between meteorological and wireless stations, ashore and afloat, would benefit navigation as well as meteorology for the captain of a ship at sea has a profound interest in forthcoming weather changes. The receipt of various meteorological data from a few stations would not always suffice, but the void would be filled if the wireless stations on the coast should send out daily, at a predetermined hour, weather forecasts obtained from neighboring meteorological stations, for the benefit of all ships within the zones of influence of the wireless stations. In particular, effective warnings of approaching storms might be given in this way

An attempt in this direction has already been made in Holland. The police schooner of the North Sea fisheries receives daily, while within the zone of influence of the wireless station of Scheveningen, the weather forecasts of the meteorological institute at Bilt. Whenever it is possible, special storm warnings are also sent to the schooner, which transmits the messages to the fishing boats by flag signals.

It may be expected that, as the number and frequency of weather reports sent by vessels to meteorological stations increases, the forecasts will become more accurate and more valuable to the vessels which receive them.—Cosmos.

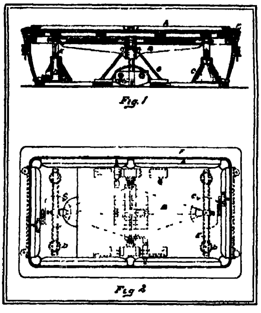
Experiments in abrasion conducted at a French mint have shown that aluminium coins will be less rapidly worn by use than coins made of gold, silver, or [illegible]

A BILLIARD TABLE FOR SHIPS.

BY HAROLD J. SHEPSTONE.

To the wide range of amusements now found on the leading liners, billiards may be added in the near future. This has been rendered possible through the invention of an ingenious movable table top by two London inventors, Messrs. Terrey and Warren Hitherto it has been impossible to play billiards at sea, chiefly for the reason that billiard balls, like other things, are inexorably subject to the law of gravitation It seems an undoubted fact, nevertheless, that a billiard table was put into the 'Great Eastern" The assumption may possibly have been that the huge proportions of the mammoth liner would insure so stable a platform at sea, at all events in ordinary weather that the balls would not cannon of their own account If such was the expectation however it was doomed to disappointment. To-day it would be just as impossible to play billiards on the Lusitania' or on the Adriatic," unless they were at anchor, as it was on their precursor of fifty years ago



SIDE AND PLAN VIEWS OF THE BILLIARD TABLE.

A comparatively modern idea—for the question of a suitable billiard table for ships has received the attention of the makers for a considerable time past—was to fit up a ship with a saloon so suspended that it would remain unaffected by the vessel's movements. Its floor, it was hoped, would remain perfectly horizontal, whatever the rolling or pitching and its occupants would be immune from sea-sickness. This notion, despite its humanitarian motives, was doomed to disappointment The swinging cabin did not work satisfactorily in practice. For one thing it proved too jerky, and did not add to the safety or comfort of the ship.

A reference to our plans will show how these desirable qualities have been secured *A* is the bed of the table, which is secured to transverse girders, situated near the ends of the table. Each girder carries, at the center of its length, the hollow element of a pivot whose axis is longitudinal to the table, the solid element of the pivot consisting of the shaft *B* This latter is secured to a cross piece, to which is also secured a transverse shaft, which is carried in brackets *G* bolted to the deck of the billiard saloon of the ship. The horizontal position of the bed of the table is maintained by depending counterbalance weights, of which there are three, namely, one at each end, secured to the transverse girder for counteracting the effect of the list of the ship, and a central counterbalance for counteracting the effect of a change of trim *D* is a dashpot to hold the opposite end of the table in balance The two shafts are each carried on ball bearings for the purpose of eliminating friction as much as possible The table shown in our illustration measures 6 feet by 3 feet or three-quarters size A full size table of course, could be erected on the same principle, but space being valuable on board ship, it is probable that the smaller size would be chosen

A BILLIARD TABLE FOR SHIPS

A Project for the International Exploration of the Atlantic

At the international geographical congress which met recently in Geneva two delegates called attention to the necessity for an international exploration of the Atlantic Ocean and suggested the formation for this purpose of an association similar to that which has already been formed for the study of the seas of northern Europe All Atlantic exploring expeditions of recent years have proceeded southward from Europe and have confined their observations almost entirely to the southern half of the Atlantic Since the memorable voyage of the 'Challenger (1872 1876) and the last American expedition no ship equipped with modern apparatus has made explorations in the Gulf Stream and the northern Atlantic although thorough knowledge of these waters is necessary to a complete understanding of the phenomena of the south Atlantic. Almost nothing is known about the laws and range of temperature and the velocity of currents in the north Atlantic although the variations of temperature of the Gulf Stream undoubtedly exert a powerful influence upon the climate of all northern Europe A study of the meteorological conditions of the northern Atlantic is also greatly needed for through this region sweep the barometric depressions the frequency and paths of which seriously affect the crops of western Europe The connection between hydrographic and atmospheric phenomena about which so little is known also demands study

Many biological problems too await solution The larvæ of the European eel have been found in the Atlantic west of Ireland at a depth of 3 300 feet, and Dr Hjort has found larvæ of other fishes at great depths in the ocean between Norway and Jan Mayen, so that a systematic and scientific north Atlantic fishery would probably produce surprising results. In this connection the quantity and character of the plankton which both directly and indirectly influence the migration of fishes, demand thorough study Finally the exploration of the waters of northern Europe cannot be regarded as complete so long as we remain in ignorance of the currents temperatures and biology of the Atlantic of which the North Sea the Baltic the English Channel etc are dependencies

It is the more remarkable that the north Atlantic is one of the least known of oceanic regions as the most important highways of traffic traverse this region It is true that the profile of the sea bottom has been made known in rough outline by the work of the cable layers but we know very little more of the physical characters of this region.

The Gulf Stream requires especially thorough study because of its great influence on the climate of Europe Voyages of exploration should be made four times each year and the operations should always include measurements of temperature and salinity at various depths and the collection of specimens of plankton and sea bottom All the expeditions should use identical instruments methods, units and constants so that their results may be directly compared with each other In order to save expenses the proposed plan does not include an international bureau of operation, but merely an international commission to prescribe instruments and methods and assign to each government the field which it is then to explore with its own men and at its own expense. The participation of individuals will also be welcomed and sought and the assistance of the great steamship companies is confidently expected.

SECOND HONORABLE MENTION ESSAY ON THE FOURTH DIMENSION.

BY PLATONIDES (F C FERRY)

(Judges—Prof Henry P Manning of Brown University and Prof S A Mitchell of Columbia University)

The schoolboy early becomes familiar with linear measure square measure and solid or cubic measure He understands them respectively as the measurement of lengths the measurement of surface which depends on length and breadth taken conjointly and the measurement of volume which depends on length breadth and height all taken together The first involves one dimension length the second two mutually perpendicular dimensions length and breadth multiplied together and the third three dimensions each perpendicular to the other two—length breadth and height all multiplied together Let the units of these three kinds of measure (e g foot square foot and cubic foot) be represented by a line *AB* a square *ABCD* with that line as side and a cube *ABCD-G* with that line as edge and that square as base (Fig 1) The unit *AB* may be regarded as made up of an infinitely large number *M* of points arranged continuously from *A* to *B* the square *ABCD* then contains $M \times M = M^2$ points and the cube *ABCD G* contains $M \times M \times M = M^3$ points One can go from any point in *AB* to any or every other point therein by following the one fixed direction of *AB* similarly from any point to any or every other in *ABCD* by moving in the two fixed directions of the bounding lines and likewise in *ABCD G* by moving in the three fixed directions of the bounding lines (direction forward or backward being regarded as the same in every case) Hence with regard to motion from one point to another the first unit is one dimensional the second two-dimensional and the third three dimensional

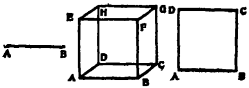


FIG 1

Man can make no motion which cannot be resolved into a combination of three mutually perpendicular directions he can reach no place which cannot be reached by going north or south east or west and upward or downward he can find no point in a room which cannot be found by moving in the direction of the length breadth and height of the room Sight reveals two dimensions directly the breadth and the height of the object beheld while the third dimension the distance of the object is estimated by means of the muscular turning of the eyes to focus them on it Nothing calls for a fourth direction perpendicular to the other three in fact all of man's experience leaves him satisfied with three dimensions

FIG 2

Leaving experience behind and reasoning wholly from analogy the fourth dimension is introduced as follows Four-dimensional measure depends on length breadth height and a fourth dimension all multiplied together It involves four linear dimensions each perpendicular to the other three consequently the fourth dimension is at right angles to each of the three dimensions of the three-dimensional measure Its unit must have *AB* as edge the square *ABCD* as face and the cube *ABCD G* as base It contains $M \times M \times M \times M = M^4$ points To travel from any point to any or every other point in it is possible by moving in the four fixed directions of its bounding lines

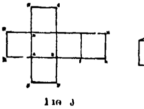

FIG 3

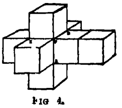

FIG 4

The square *ABCD* (Fig 1) is derived from the line *AB* by letting *AB* with its *M* points move through a distance of one foot in a direction perpendicular to the one dimension of *AB* every point of *AB* in this motion describes a line and *ABCD* contains therefore *M* lines as well as M^2 points The cube *ABCD-G* is derived from the square *ABCD* by letting *ABCD* move one foot in a direction perpendicular to its two dimensions its *M* lines and M^2 points describe respectively *M* squares and M^2 lines accordingly *ABCD G* contains *M* squares M^2 lines and M^3 points Similarly the four-dimensional unit is derived from the cube *ABCD-G* by letting that cube move one foot in a direction perpendicular to each of its three dimensions i e in the direction of the fourth dimension, its *M* squares M^2 lines, and M^3 points describe respectively *M* cubes M^2 squares and M^3 lines accordingly the four dimensional unit contains *M* cubes, M^2 squares, M^3 lines, and M^4 points Considering the boundaries of the units *AB* has two bounding points *ABCD* has four *ABCD-G* has eight—four each from the initial and the final positions of the moving square—and the four-dimensional unit has 16—eight each from the initial and the final positions of the moving cube Of bounding lines *AB* has one (or is itself one) *ABCD* has four *ABCD-G* has twelve—four each from the initial and the final positions of the moving square and four described by the four bounding points of that square and the four-dimensional unit has 32—twelve each from the initial and the final positions of the moving cube and eight described by the eight bounding points of that cube Similarly of bounding squares *ABCD* has one (or is itself one) *ABCD G* has six—one each from the initial and the final positions of *ABCD* and four described by the bounding lines of the moving square—and the four-dimensional unit has 24—six each from the initial and the final positions of the moving cube and twelve described by the bounding lines of the moving cube Finally of bounding cubes *ABCD-G* has one (or is itself one) and the four-dimensional unit has eight—one each from the initial and the final positions of the moving cube and six described by the bounding squares of the moving cube

If the bounding lines of the square *ABCD* are supposed to be made of a continuous wire and that wire is cut at *D* the boundary may then be folded down into line with *AB* forming a one dimensional figure (Fig 2) of four linear units The original linear unit *AB* has one linear unit at either side of it and an extra one *CD* beyond on one side If the cube *ABCD G* has its bounding squares supposedly made of a continuous sheet of tin and that sheet is cut along the lines *EF GH HE AF BF CG* and *DH* the square faces can be folded down to form a two-dimensional figure of six squares The square *ABCD* has a square at each side of it and an extra one *EFGH* beyond on one side (Fig 3) Likewise if the four-dimensional unit has its bounding cubes made of connected solid wood and this wood is cut through the appropriate planes the cubes can be folded down to form by analogy a three dimensional figure of eight cubes The cube *ABCD G* has a cube at each side of it and an extra one beyond on one side (Fig 4) These eight cubes now forming a three dimensional figure constituted the boundary of the four dimensional unit

FIG 5

FIG 6

The following table shows the results obtained for the contents and the boundaries of the four units considered

CONTENTS

	Points	Lines	Squares	Cubes
One dimensional unit	M	1	0	0
Two dimensional unit	M^2	M	1	0
Three dimensional unit	M^3	M^2	M	1
Four-dimensional unit	M^4	M^3	M^2	M

BOUNDARIES

	Points	Lines	Squares	Cubes
One dimensional unit	2	1	0	0
Two-dimensional unit	4	4	1	0
Three dimensional unit	8	12	6	1
Four dimensional unit	16	32	24	8

The reasoning used is capable of extension at once to units of five or even more, dimensions

If the one-dimensional unit is extended indefinitely to the right beyond *B* and to the left beyond *A* so that its length becomes greater than any number one can name it represents a one-dimensional space Similarly the indefinitely great extension equally in every dimension of the other units gives a representation respectively of two-dimensional three-dimensional and four-dimensional spaces

The one dimensional unit is separated from the rest of the one-dimensional space in which it lies by two points the two-dimensional unit from the rest of its two-dimensional space by four lines the three-dimensional unit from the rest of its space by six squares and similarly the four-dimensional unit is separated from the rest of the four-dimensional space in which it lies by eight cubes To inclose an object of any number of dimensions in space of the fixed number of dimensions demands, in one-dimensional space, two points, in two-dimensional space, at least three lines, in three-dimensional space, at least four planes, and, in four-dimensional space, at least five three-dimensional spaces

As with the units, so with the spaces, any point can be reached from any other in the same space by moving in as many fixed directions, each perpendicular to the rest, as that space has dimensions

Time represents a one-dimensional space; for it proceeds in one direction only from an indefinitely remote past to an indefinitely distant future (Fig 5) The present is a point traveling through time (or allowing time to slip past it) with uniform velocity, and any point in time can be reached by traveling through a definite distance (in years months etc) from one chosen fixed point (e g the birth of Christ)

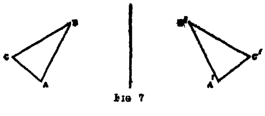

FIG 7

Any portion of the earth's surface regarded as a plane represents a portion of a two-dimensional space and the two fixed directions are those of latitude and longitude An illustration of three-dimensional space is that space—to man's perceptions—in which the universe is placed Man can find no illustration of a four-dimensional space

If two lines *AB* and *B'A'* in the same one-dimensional space are symmetrical about a point *O* of that space (Fig 6) *AB* cannot be so moved in that space that the corresponding points shall coincide (*A* with *A'* *B* with *B'* etc) To effect such coincidence it is necessary to rotate *AB* through two-dimensional space about *O* as a center or roughly speaking *AB* must be taken up into two-dimensional space turned over and put down on *B'A'* Likewise if two triangles, in the same two-dimensional space are symmetrical with respect to a line (Fig 7) such coincidence of corresponding points and lines can be effected only by rotating one triangle through three dimensional space about the line of symmetry or roughly speaking one triangle must be taken up into three-dimensional space turned over and put down on the other Again if two polyhedral figures in the same three-dimensional space are symmetrical with respect to a plane (Fig 8) coincidence of corresponding points lines and planes can be effected only by rotating one polyhedral figure through four-dimensional space about that plane or roughly speaking one of the polyhedral figures must be taken up into four-dimensional space turned over and put down on the other A right hand and its reflection (a left hand) in a mirror are symmetrical with respect to the plane of the mirror and rotation about that plane would effect coincidence Such rotation would make a right glove become a left glove or roughly speaking a right glove tossed up in the direction of the fourth dimension and turning over there will fall back a left glove

The inability of man to locate the fourth dimension or to detect the existence of a four dimensional space even if it be close at hand is comparable with the inability of a two-dimensional man inhabiting a two-dimensional space to locate the third dimension or to detect the existence of three-dimensional space even though his own space might be part of it as a plane is part of a solid Suppose the two dimensional space represented by this page to be inhabited by two-dimensional beings They have length and breadth can move in those two dimensions, and are supposedly conscious of them They have no thickness, cannot rise from the paper or sink beneath it and are unconscious of any dimension in such a direction, they have no "upward" and no "downward" Let them have intelligence concerning all within their space to the extent that man is intelligent regarding his universe, let them possess houses and barns and in general let their life be as rich as may be Their houses and barns will have no roofs and no floors, for the bounds of the space itself alone are there Three lines are sufficient to inclose any object in their world, and the flat-man himself is as

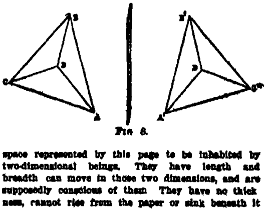

FIG 8.

point only along his polygonal contour; the interior of his polygon—his own interior—is to be reached only through this contour, for there is no "above" and no "below" within his cognizance. To convince him that a third dimension of "upward" and "downward" exists, touching and leading from even the interior of his polygon—his own internal parts—would be a hopeless task Even if he accepts the arguments from analogy as to the properties of such a dimension, he would rebel at the idea of looking within himself to find it. Yet, even there, at right angles to the two dimensions which he knows, it is to be found—as well as everywhere else in his space. And, similarly, within himself, quite as much as anywhere else, must man look if he is to find the fourth dimension.

Were one to explain to this flat-man that a three-dimensional being, approaching from the direction of that unknown third dimension, could reach within his most securely locked barn and remove its contents without opening a door or breaking a wall—or could touch the very heart of the flat-man himself without piercing his skin—the flat man might still be none the nearer to an appreciation of the third dimension Equally impossible is it for man to understand from what direction a four-dimensional robber must come to steal the treasures from the soundest vault without opening or breaking it—or by what way of approach the four-dimensional physician would reach to touch the inmost spot of the human heart without piercing the skin of the body or the wall of the heart, yet the route of such a robber and of such a physician lies along the fourth dimension. By that route must come the *four-dimensional* being who is to remove the contents of the egg without puncturing the shell or drink the liquor from the bottle without drawing the cork Such four-dimensional creatures, inhabiting a space containing the three-dimensional space where man lives, would constitute the most perfect of ghosts for man's world, and the absence of such ghosts argues against the existence of a four-dimensional space so situated and so inhabited

Algebra demands that geometry picture all its problems, and since an algebraic problem may contain four or five or more unknown quantities quite as well as any lesser number, algebra demands a four-dimensional, five-dimensional, or higher space for its use quite as imperatively as the spaces of lower dimensions. Perhaps certain phenomena of molecular physics or the mechanical principles of the electric current may find a complete explanation only with the use of the fourth dimension Perhaps the fourth dimension escapes man's discovery only because the measurements in its direction are always very minute in comparison with the measurements in the three other dimensions. Thus far, however the space of four dimensions—and all spaces of more dimensions—may be only "the fictitious geometric representation of an algebraic identity"

A NEW SCOTCH ELEVATING FERRY.

BY WILLIAM GARLIN.

The front-page illustration shows the construction of the new elevating vehicular ferry steamer "Finnieston No. 1," recently constructed at Port Glasgow for the Trustees of the Clyde Navigation under the direction of G H Baxter, Esq., mechanical engineer The vessel was launched with machinery aboard and steam up, the illustration being a photograph taken immediately after the launching The leading dimensions are, length 104 feet, beam 45 feet, and molded depth 12½ feet.

It may be stated that the elevating platform which carries the vehicles has a range of 17 feet and is carried on eight double-threaded buttress screws of forged steel. The screws are hung on collar bearings in cast steel brackets, which are supported by the framing legs. The platform is built up of H girders connected with massive built steel girders on either side of vessel. The supporting screws are fitted with worm wheels at their lower ends, and mesh with forged steel worms.

A triple-expansion, three-crank engine raises or lowers the main platform. An automatic gear is fitted to this engine, so that the platform may not be raised or lowered beyond its intended travel A brass gage in the engine room also indicates the position of the platform in feet and inches.

The lower or main deck is of steel plating, and has no projections above 10 inches. As a result, the platform may drop to its lowest level.

Vertical three-crank, triple-expansion engines are used for propulsion, each engine driving two propellers, one forward and one aft, with two thrust blocks fitted on each line of shafting. The engines are controlled from the house on the top of the framing by balanced rods which actuate the steam throttles in the direct-acting steam and hydraulic reversing engines. There are no rudders, the vessel being maneuvered entirely by the propelling machinery. Two reversing handles are situated in the wheel house, one on each side of the man at the wheel.

Correspondence.

THE EGYPTIAN STEAM CULTIVATOR.

To the Editor of the SCIENTIFIC AMERICAN:

In March last I noted a short article in your paper speaking of a steam cultivator by Boghos Pacha Nubar, a farmer in upper Egypt. The description and purpose of this cultivator are both identical with a machine that I was interested in some ten years or more ago, together with a number of others here, a company to promote which was formed, but failed to produce a thoroughly commercial machine By that I mean that although several machines were built, with from two to six rotary disks or tools, as we call them, owing to lack of capital we were not able to put out a machine that would work day in and day out without a break of some kind This we know was only a question of capital and experiments

I write you so as to correct any impression that may exist as to the originality of the machine you speak of for I may add this principle was patented here in Canada more than twenty years ago and should you desire to know more of it, the information could be secured H J ROSS

Montreal, Canada.

THE PROPOSED MONTREAL DRYDOCK.

To the Editor of the SCIENTIFIC AMERICAN

I read in the press of a proposal to have a floating drydock in Montreal, and the following suggestion flashed into my mind as being most suitable for local reasons Instead of a floating dock why not excavate a dock, near the exit of the Lachine Canal in two sections, one the real drydock with the floor just above the level of high water at Montreal, the other in continuation with floor at level of present harbor bottom level

Vessels could then run into the lower section, gates be closed, and water run in from the canal through sluices which would raise the level some 50 feet, or as required, pass the boat into the inner section, close sluices and open outflow, letting the water run out, thus saving pumping, time and expense

At the beginning of navigation perhaps some pumping might be required during the freshets.

This, in my opinion, would be the easiest, cheapest and most permanent way to build a drydock at Montreal VICTOR F CONNOR, L R C P I

Great Village, N S

THE NUMBER OF OUR ANCESTORS

To the Editor of the SCIENTIFIC AMERICAN

May I suggest that Mr McCullough has not solved the problem put by Mr Venning?

No one will deny that, shall we say, John Brown had a father and a mother that his parents each had a father and a mother and so on for (all?) previous generations. It would appear then to follow that x generations back John Brown had 2^x ancestors! This is what Mr Venning says *appears* to be the *fact* He does not say it *is the fact*, indeed, he asks for an explanation of the difficulty he is placed in in not being able to reconcile this apparent fact with common sense

Would any of your readers explain where the error creeps in? John Brown we know had 2 parents we know he had 2^2 grandparents we know he had 2^3 great parents Why then is it not true that for the xth generation back he had 2^x ancestors?

Bristol, England F C CONSTABLE, M.A.

SIGNALING TO MARS.

To the Editor of the SCIENTIFIC AMERICAN

The possibility of signaling to Mars is merely a question of elementary mathematics. That it should have excited such widespread interest and discussion can have astonished no one more than the writer That in spite of this widespread and in many cases correct exposition by the newspapers there should still remain some who fail to grasp the elementary principles of the problem is *my only* excuse for what may seem *to many of your* readers a wasteful use of valuable space in your paper

Reference is here made to two communications in your issue of June 26th The first is by a gentleman connected with Adelphi College, Brooklyn This criticism is that if the signals were sent when Mars was in opposition they could not be seen. The obvious answer would seem to be "Then why send them when Mars is in opposition?" There are two positions of the earth in its orbit when it is invisible from Mars. One is when it is between Mars and the sun, and the other when it is on the opposite side of the sun. So it would hardly seem desirable to send signals to Mars under either of these circumstances. Signals could be sent in any other relative position of the two planets, as has been fully explained in several of the daily papers. This statement will also answer the criticism of the gentleman regarding the perfectly logical and correct suggestion of Prof. Wood, that a signal might also be sent by means of a dark area upon a white field

The first mistake of the other writer is due to the fact that in the cases which he cites, and with which he is familiar, the angular size of the mirror is greater than the angular size of the sun The object of the silvering of the mirror is to change the direction of the rays of light but it really has nothing to do with the question in hand and we may consider for convenience that the mirror has been removed during our experiments and that the sunlight is simply shining through the hole in the frame If now we are very near the mirror so that we see the whole of the sun's disk through the aperture, a 2 inch mirror will transmit just as much light as one ten feet in diameter If however, we go to a distance of several miles, the large hole will clearly let through much more light than the small one

The second mistake of this correspondent is to suppose that the signal would only be seen over a small portion of the surface of Mars In point of fact when Mars was distant one hundred millions of miles from the earth the signal would be seen simultaneously over an area one million miles in diameter No great accuracy would therefore be required in pointing the mirror, as he seems to suppose.

In closing the writer would repeat that the proposition of signaling to Mars is merely a question of the most elementary mathematics. *It is a problem which any astronomer can work out in ten minutes' time and which involves no uncertainty whatever* When Mars is at a distance of one hundred millions of miles from the earth a beam of sunlight half a mile square would appear to its inhabitants of the same brightness as a fifth magnitude star On account of the brightness of the earth however, it would be quite invisible to eyes resembling our own unless aided by a powerful telescope Whether there are the equivalents of human eyes and telescopes upon Mars is another question entirely and has nothing whatever to do with the case

WILLIAM H PICKERING

The smelter production of lead in the United States in 1908 as given by C E Siebenthal of the United States Geological Survey, under date of May 24th was 408,523 tons of 2,000 pounds, against 442 015 tons in 1907, and 418 699 tons in 1906 The production of refined primary lead, which embraced all desilvered lead produced in the country and the pig lead recovered from Mississippi Valley lead ores was 398 433 tons against 414 189 tons in 1907, and 404 669 tons in 1906 The antimonial lead produced was 13 629 tons and the recovered or secondary lead 18 284 tons In 1908 the lead smelted from domestic ores was [illegible] tons and from foreign ores and foreign base bullion (almost wholly Mexican), 97,761 tons

CONSTRUCTING THE CONCRETE LOCKS OF THE PANAMA CANAL.

BY H. PRIME KIEFFER.

The final plans for the locks of the Panama Canal have just been adopted and the accompanying drawings will serve to illustrate the colossal proportions of these great engineering works. They are to be constructed wholly of that newest of building mediums—concrete and it is extremely doubtful whether the great waterway would have been designed upon its present ambitious lines, had not concrete gained the powerful prestige as a building material which it now holds. A number of other giant structures such as the Gatun spillway and various dams culverts diversion tunnels etc are being carried out in this medium but the most interesting of all will be the mammoth locks. They will be by far the largest and longest concrete structures of the kind in the world and *it is improbable that they ever will be exceeded*

The locks will be six in number three at Gatun on the Atlantic side of the Isthmus one at Pedro Miguel, and two at Miraflores both of these latter points being on the Pacific side of the Isthmus. The channel from Gatun to Pedro Miguel will lie in Gatun Lake at an elevation of 85 feet above sea level

The adopted plans call for locks 1 000 feet long 110 feet wide and all in duplicate that is to say with two sets of locks side by side. The three locks at Gatun will be built as a continuous structure and together with the piers at either end they will have a total length of 4800 feet all of massive and continuous concrete work. At Pedro Miguel the one lock with piers will have a length of about 1 800 feet and at Miraflores the two locks and piers will be about 2 800 feet in length. The building of these locks will necessitate the use of about 8 000 000 cubic yards of concrete which if loaded on the 20-yard cars in use on the canal would reach sixty times across the Isthmus or it would make a string of such cars reaching from New York to Chicago to New Orleans and back to Chicago again. Cement alone to the amount of 900 000 tons will be employed

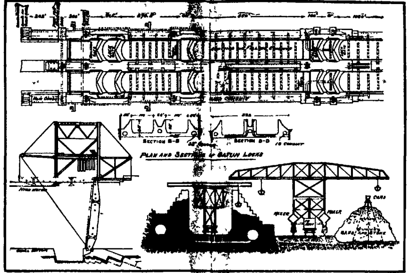
In addition to their size the locks will present many interesting studies in their safeguarding features and in the mechanical and electrical devices for the opening of the gates the rapid unwatering of the locks towing of vessels etc. These appliances as well as the very locks themselves have been designed with such care and skill that the factor human frailty cannot possibly play the important rôle which the enemies of the lock type would have us believe

The locks will have plate-steel hinged arch gates in duplicate and these gates will be protected by massive fender chains stretched across the locks ahead of the gates to take up the shock in case a vessel approached the gates too rapidly. Although these chains are not designed to absorb the total shock they will check the vessel's speed and thereby protect the gates. In addition to this precaution the vessels will be required to come to anchor at the piers outside of the locks and the towing ropes will there be made fast. Then by the aid of mechanical mules located on top of the lock walls the vessel will be towed through the locks at a uniform speed and the vessel held in perfect control. This can be readily accomplished as there will be no tides or storms with which to combat. The gates are of exceedingly massive construction set in walls of solid concrete 10 to 60 feet in thickness

As a precaution against the carrying away of the lock gates by a similar accident to that which recently occurred at the Soo Canal they are being built in pairs with a water space of about 80 feet between them. The first gate will serve a similar purpose to that of the heavy guard chain above referred to. Should a vessel break through the guard chain which would check its speed it would bring up against the first set of gates which are of such enormous strength that they would be certain to check the vessel's way. Should they be broken the water would still be held by the second set of gates. As an additional precaution however and in the inconceivable event of both gates being broken down at the Gatun end of the lock there will be built a huge structural steel wicket swinging dam similar in principle to that which was used effectively in stopping the rush of water at the Soo Canal. The structure is nothing more nor less than a massive swinging bridge similar to a railroad drawbridge. On the under side of the floor are attached about a dozen heavy steel girders which are hinged at the edge of the bottom floor which is downstream when the dam is swung across the canal entrance. The other ends of the girders are attached to hoisting and lowering cables electrically operated. To close the waterway the dam is swung around across the entrance the girders are lowered until their bottom ends rest upon bearings countersunk in the floor of the canal and then a series of transverse steel plates or wickets are lowered in succession across the face of the girders gradually closing the channel from the bottom upward until the passage is entirely shut off

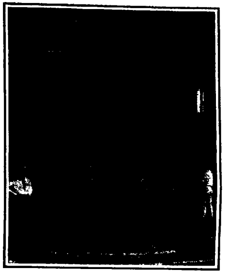
Another feature of the locks which, because of its great magnitude is of unusual interest is the system of conduits by which the locks will be filled and unwatered. Below the floor of the locks and arranged transversely to their axes is a series of large conduits fed by numerous openings through the floor. These conduits lead into larger conduits built in the walls of the lock which range in diameter from 18 to 22 feet. In the latter are set the huge gates by which the flow of the water into or out of the lock is manipulated. There are over one hundred ducts opening into each lock and because of their number and uniform distribution there will be no disturbing currents in the water and the filling and emptying will be done with unusual rapidity

Portable grab bucket crane unloading crushed rock from scows in the old French canal at the Gatun docks



Cross-section of emergency dam in the closed position, with wicket girders down and sliding gates partly in the lowered position

Diagram showing method of building the locks at Pacific end of canal. Sand and stone are lifted from the stock pile to the mixers, and from the mixers the concrete is carried to the lock site by the two cantilever cranes

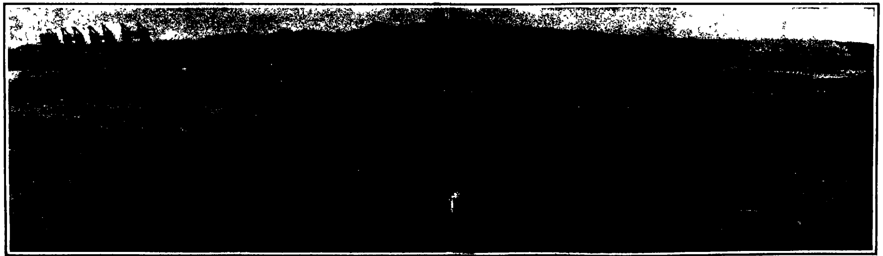


One of the concrete mixers dumping its load into steel cars for transportation to the overhead cableway that spans the Gatun locks

How the 4,000,000 cubic yards of concrete are being mixed and built into place at the Gatun locks

The Gatun dam is 115 feet high 2,400 feet wide, and about 9 000 feet long. Near the center is a natural hill of rock through which it was decided to build the spillway. The above photograph is taken looking through the completed spillway excavation which will be lined with a heavy covering of concrete both on floor and sides. Concreting has commenced and is now well under way

Excavation for spillway in center of Gatun dam



In the forefront are four completed towers of the cableways which will span the twin locks. In the distance are four corresponding towers in course of erection. Between and running from right to left is the excavation for the locks, which will be 380 feet wide and 3,800 feet long. They will consist of a huge monolith containing 4,000,000 cubic yards of concrete. The concrete will be brought to the cableways from the mixers in electrically-operated cars, picked up by the cableway, and deposited in place

Excavation for the Gatun locks, showing the lofty steel towers for the construction cableways.

CONSTRUCTING THE CONCRETE LOCKS OF THE PANAMA CANAL.

MATERIAL HANDLING PLANTS FOR THE LOCKS

Naturally the plant employed in the construction of such large structures involving the laying of 8 000 000 cubic yards of concrete is extraordinary in size and calls for much ingenuity of design. There are in the United States and in Germany some very large interesting and economical plants for the mixing, transportation and placing of concrete but the one now about completed at Gatun will surpass in magnitude anything ever attempted. The plant at Gatun will be used for all three of the locks as they are to be built practically as one monolithic structure. The lock at Pedro Miguel and the two at Miraflores will for several reasons demand entirely different material handling plants

At Gatun about 4 000 000 cubic yards of concrete will be employed. The crushed stone the sand and the cement for this concrete will be handled in the following manner. The crushed stone will come from Porto Bello a small hamlet about 20 miles east of Colon along the Atlantic coast. The rock will be taken from the quarry by steam shovels and sent by gravity to the giant crushers and thence by gravity to the barges in the harbor. From this point it will be carried to Cristobal at the Atlantic entrance to the canal and thence via the old French channel to the docks at Gatun. Here it will be unloaded into storage bins by giant grab buckets operated from cableways suspended between two sets of towers on either side of the channel

The sand will come from Nombre de Dios about 40 miles along the coast from Colon. It will be taken from the sand pits by clamshell buckets loaded into steel barges and taken to Gatun where it will be unloaded by a process similar to that of unloading the crushed rock. The cement is now being shipped from New York. At Colon the cement will be transferred to barges and taken *via* the old French channel to Gatun and unloaded to the storage yards. The rock and sand storage piles have a capacity of about 300 000 cubic yards while the cement yard accommodates about 100 000 barrels. From these storage buildings the rock sand and cement will be delivered through valves to charging cars running underneath. These cars which are electrically operated carry the materials to the concrete-mixing machines located nearer the locks site and discharge it direct to the machines. About eight of these machines will be employed on the Gatun locks. After the concrete is mixed it will be dumped into buckets set on flat cars and the cars will be run to position under the great cableways spanning the locks site and from these cableways the buckets filled with concrete will be swung to position on the locks under construction

The concrete-handling plants at Pedro Miguel and at Miraflores will be essentially different from the one at Gatun. It is desired to prosecute work simultaneously at all the locks and therefore the great cableways and other plant at Gatun could not be used on the Pacific side. The plant at Gatun will be economical because the three locks there are all continuous. It would not be economical to build other similar separate plants at both Pedro Miguel and Miraflores. In addition to this fact the ground surrounding the locks at these two latter points is very unstable and it would be unwise to place the great towers there. In their stead therefore there will be used a system of cantilever and berm cranes. These cranes will take the materials from storage and from cars and after mixing will deliver the concrete to place in the lock forms. It will be recalled that the materials at Gatun will be delivered by water while at Pedro Miguel and Miraflores they will come by rail. As there is but one lock at the former point the plant there will be taken upon completion of the lock to Miraflores to assist in the work on the two locks at that point

The cantilever cranes are set on towers which rest on trucks running on tracks parallel to the lock walls. These cranes will travel the full length of the locks and of course parallel to them. They are situated outside of the locks. They will gather the material from the storage piles and with the aid of grab buckets drop it into the concrete-mixing machines situated in the towers. The inner arms of the cranes will then be used to transfer the concrete to the outside lock walls and to the smaller or berm cranes which will in turn place it in position on the foundation and center wall between the locks at points inaccessible to the cantilever cranes. The guaranteed capacity of the plant on the Miraflores locks is about 2,500 cubic yards of concrete per day. That of the cranes at Pedro Miguel is about one-half this, as the structure will be only half as large as the ones at Miraflores. All of the cranes, cableways, mixers, etc., will be electrically operated, and the power plants for furnishing the current are now about completed.

The forms for the concrete walls are to be of steel, and will all be interchangeable, which will allow them to be used on successive stages of the work. The circular forms for the water conduits, machinery chambers, etc., will all be of the rapid collapsible sheet steel type.

◆

FOODS AND DIGESTION

The subject of food and its digestion is one of the most important with which the human family is concerned, and yet, strange to say, there is very little known about the comparative digestibility of foods by the average person.

To present certain facts relative to digestion, we have prepared an engraving which shows the relative digestibility of foods of various kinds. It will be seen that the baked apple and the raw egg are near the winning post, the egg being tied by the fish. Then follows venison, all these being digested within an hour. Then come milk, turkey, duck, and oysters. New bread and cheese follow in the same class with the above, the time required to digest them being about three hours. Then come turnips, potatoes, roast chicken, and cabbage. We are fast getting into the period of indigestibility, which is beautifully summed up in pork and veal, which require under the most favorable conditions five hours to digest. In the sixth hour and beyond class we find jam, crabs, and alcoholic beverages of various descriptions. Certain other articles of food are about as bad as crabs and jam, notably eels, which are notoriously indigestible, requiring six hours; also stone fruits, which require the same period.

THE RACE OF FOODS FOR FIRST PLACE IN THE DIGESTION RACE.

It will be seen by our engraving that, as a rule, cooking facilitates digestion, partly by softening the food and partly by inducing chemical changes which would otherwise have to be induced by functional activities. Fat retards digestion, as it has to undergo a long process of emulsifying before being absorbed. This accounts for the indigestibility of pork.

Under normal conditions it is well that the digestive process should not be prolonged beyond four and one-half hours. For invalids and others with weak stomachs the time should be much less. As a result of repeated experiments, the following digestive time table will be found of considerable interest:

Food.	How Prepared.	Time. Hours.	Time. Minutes.
Apples, sweet	Raw	1	30
green	Stewed	1	35

Spontaneous Combustion of Textile Fibers.

Unspun and uncarded textile fibers collected in large masses have caused many conflagrations through spontaneous combustion. It appears to be established that clean fibers do not ignite spontaneously and that the combustion is due to the impurities, which consist chiefly of oils used in the preparation of the fibers and of the natural grease of unwashed or insufficiently washed wool. The refusal of a shipping company to transport shoddy in a ship's hold has led a German investigator to make comparative studies of the shoddy and the fibers which were accepted for shipment, in regard to the nature of their impurities and the degree of spontaneous heating to which they are subject. The admitted fibers included unwashed wool containing 6 to 21 per cent of grease, washed wool containing about 3 per cent of grease, wool cardings and combings containing 2 to 3 per cent of added oil, and raw cotton containing about ½ per cent of grease. The shoddy contained from 1 to 5 per cent of oil. The experiments were conducted by compressing with the hands about 2 ounces of the fiber into a ball surrounding the bulb of a thermometer, placing the ball in a wool oven heated to 230 deg. F., and reading the thermometer at intervals until the temperature ceased to rise. The first series of experiments were made with cotton, with which increasing quantities of oil were incorporated in successive experiments. A curious and inexplicable fact was observed. The cotton to which no oil was added, and which contained only 1/6 per cent of fatty matter, showed at the end of two hours an elevation of temperature of 16 deg. F. above the constant temperature of the oven.

Very dirty unwashed wool, which lost 64 per cent of its weight in washing, showed a superheating of 21½ deg. F. in five hours. Wool washed in three baths of boiling petroleum naphtha for three hours, superheated 11 deg. F. in three hours, and the same wool after the addition of 10 per cent of olein superheated 21½ deg. F. in three hours. Five specimens of wool shoddy, containing a maximum of 5 per cent of olein and a maximum of 10 per cent of cotton, showed elevations of temperature varying from zero to 18 deg. F. in three hours or more. The conclusion is that spontaneous combustion cannot occur in fibers containing less than 10 per cent of fatty matter, and that such fibers may safely be stowed in the hold of a ship.

The Chemist in the Soap Factory.

In view of the lively competition which prevails in the soap industry it is necessary to exercise constant control, by chemical analysis, over everything, from the raw material to the finished soap and by-products. In the analysis of raw material great care should be taken to obtain fairly representative specimens. In analyzing animal fats it is only necessary to determine the proportions of water, ash, dirt (matter insoluble in ether), free fatty acids, and unsaponifiable matter. From these data the yield of glycerin and fatty acids can be calculated. In vegetable fats it is necessary to determine the proportions of water, dirt, unsaponifiable matter, the iodine ratio, and in some cases the saponification ratio and the amount of free fatty acids. It is often necessary, also, to apply iodine, saponification, titration, and color tests to the fatty acids after separation.

As the proportions of the different fatty acids in a mixture can be determined only approximately (to 5 or 10 per cent) by these methods, it would be very desirable to have all the constants, especially those of the most largely used fats and oils, accurately remeasured. Another desideratum is an agreement among soapmakers to employ similar methods, in order to prevent controversy in buying and selling.

The alkalies employed must be analyzed quantitatively for caustic and carbonated alkali and sometimes for the proportions of soda and potash. The purity of the acids and other chemicals used in bleaching and clarifying should also be tested.

The actual soapmaking should be left to the practical soapmaker, but the chemist should always determine the excess of alkali or of fatty acid in the finished product, in order that the manufacturer may give guarantees of quality.

Finally, the residual liquors must be analyzed for glycerin, salt, impurities, and alkali.

Another extensive field of work is open to the chemist in devising and testing new processes and products, and improvements in manufacture.

◆

The Beginning of Iron.

It is commonly believed that the use of iron commenced in either Africa or Asia, but Ridgeway, in his recently published work "The Beginning of Iron," states that the latest investigations prove that iron was not worked in Egypt until the ninth century before the Christian era or in Libya until 450 B. C., that the Semites adopted its use still later, and that it has been known in Uganda only within the last five or six centuries. In China iron is first mentioned in 400 B. C. Bronze weapons were employed in China until 100 A. D., and in Japan until 700 A. D. According to Ridgeway, the metallurgy of iron must have originated in central Europe, especially in Noricum, which approximately represented modern Austria and Bavaria. Only at Hallstatt and in Bosnia and Transylvania, from which countries the Achaians and Dorians are supposed to have migrated to Greece, are found evidences of a gradual introduction of iron, at first as an ornament applied to the bronze which it ultimately displaced. Everywhere else, iron was introduced suddenly—a fact which implies a foreign origin. Of course, Ridgeway does not assert that iron was unknown outside of central Europe. On the contrary, he states that meteoric iron was known in Egypt in remote antiquity, but that it was worked as flints were worked, by cutting or chipping, and was not smelted. In other words, it was the metallurgy, not the knowledge, of iron that originated in central Europe.

Handy Man's Workshop

HOW TO MAKE CONCRETE POTTERY—III.

BY RALPH C. DAVISON

(Continued from the issue of June 20th, 1909.)

The last two articles described the method of making individual pieces by means of modeling or building up on wire frames. This is perhaps the quickest and easiest way when there are but few pieces of a kind to be made, but when a number of duplicate pieces of one design are required, it is too slow a method to be used for commercial purposes. Therefore, when a number of duplicate pieces are wanted it is best to make up a regular mold into which the concrete or Portland cement mortar is poured in a liquid or almost liquid state. These molds are usually made of plaster of Paris. The method of making them of course differs according to the design of the piece to be cast, but when one has mastered the method of making one or two designs it is easy to make others, for the reason that the general principles are the same throughout.

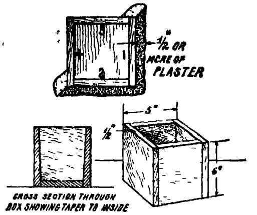

Fig. 8.—THE WOODEN MODEL AND PLAN VIEW SHOWING PLASTER APPLIED.

In all mold work the first thing required is a pattern or model of the piece which is to be produced. If the design is an original one, having relief work, and is to be reproduced from a drawing, the first thing to be done is to model it in clay and from this clay model the plaster mold is cast.

If the design is simply that of a square or round box devoid of all ornamentation or relief work, the model can be made of wood or any other material. In many instances, it is desired to reproduce articles of a more or less ornate design which one has already in hand or which one can procure, such as metal or china ornaments, vases, jardinières, etc. In this case, the mold can be made directly from the piece which it is desired to reproduce.

A plaster mold of a simple piece such as a square pot can be made according to the following directions. The model for this can be made of wood. The dimensions indicated in Fig. 8 are used merely as an example; any other dimensions can be used, as the piece can be made as large or as small as desired, or it may be made oblong. When the wood model is put together it should be well shellacked and oiled. Use fairly heavy oil or vaseline. This is done to prevent the plaster from sticking. Now place the model on the working board, which should also be oiled, and then take two pieces of modeler's clay and place them on the model at opposite corners, as indicated at *A* and *B* in Fig. 9. If modeler's clay is not handy or easily obtainable, you can make two strips of wood shaped as indicated at *C* and lightly tack these in position on the corners in place of the clay. Shellac and oil the faces of these strips. The box is now ready to receive the plaster, which should be mixed as follows: Enameled tin or iron ware makes the best thing to mix plaster in, as it is easily cleaned.

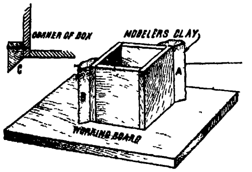

Fig. 9.—SHOWING THE CLAY PLACED AT CORNERS OF MODEL.

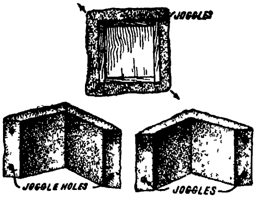

Fig. 10.—PLAN VIEW OF MODEL, ALSO TWO HALVES OF MOLD, SHOWING JOGGLES.

Place a handful of plaster in your tin and add plenty of water to it, mix it up until it is of the consistency of a thin paste. Dip your hand into this and scoop the plaster up and throw it on the sides of the model. Cover the sides completely, and keep adding plaster until the sides of the model are covered with at least ¾ inch of plaster; if thicker no harm will be done. This operation will have to be done quickly, for if not the plaster will set or become hard in the tin before you can use all of it. When it has once set before it is used, it has to be thrown out and another mix made.

The piece will now appear as indicated in the plan view, Fig. 9. Let the plaster which has been deposited on the sides 1 and 2 set for about 10 or 15 minutes and then remove the strips *A* and *B*. Cut holes about ¼ of an inch deep into the plaster on the surfaces formed by the strips *A* and *B*. These are called joggle holes, and are provided so that the plaster mold when finished will fit together properly. Shellac and oil the faces of the plaster as well as the sides 3 and 4 of the wood model, and proceed to deposit the plaster on these as was done on the sides 1 and 2. Care must be taken in all of the above operations not to move the model from its original position on the working board. The model and plaster sides should now look as shown in Fig. 10. Before removing the plaster sides level them off to the height of the model. Now lift the whole up from the working board. If care has been taken in oiling all sides of the model a slight jar will loosen the plaster from it. Then pull apart as indicated by the arrows the two plaster sides of the mold.

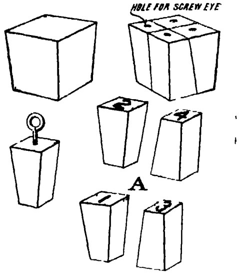

Fig. 11.—DETAILS OF THE PIECE CORE.

Lay these aside and then proceed to make the core or the part of the mold which forms the hole or the inner sides of the box. This is made as follows: It will be noticed that in the wood model of the box which is shown in Fig. 8 a slight taper is given to the inside. This taper is provided so that the core will draw out more freely than if the sides were perfectly straight. Place your model on the working board. Shellac and grease well the inside of the box, and then mix the plaster as before, and pour it into the inside of the box. Level the top and let the plaster set for 10 or 15 minutes. Now turn the box upside down and tap it gently. This will loosen the plaster core, and it will fall out. If the core should for any reason stick to the sides, the wood model should be opened a little so that the core can be taken out without injuring it. The core will then be in one piece as indicated in Fig. 11. It should now be smoothed up nicely and all corners and edges should be made round. Where a marked taper has been given to the core it might be, if well oiled, used solid in the mold when casting the cement.

It is far better, however, to make what is known as a piece core, as this can be removed more readily and is less liable to break the cement on removing than is the solid core. To make a piece core cut the solid core shown in Fig. 12 into four parts as indicated at *A*. This can be done with an ordinary wood saw. If the saw binds or sticks a little water applied to the blade will obviate the trouble. Mark the pieces thus cut 1, 2, 3, 4 as indicated, care being taken to get the proper numbers on the right pieces, as this is the rotation in which they are to be removed from the cast. Piece number 1, which is a decided wedge in shape, should be taken out first, and it is well to provide in the top of this piece, as well as in the other pieces, a straight round hole in which a screw eye of suitable size can be screwed. By passing a piece of wood through the eye of the screw the piece can be easily pulled out from the mold.

After having cut the core and fitted it together nicely as shown in Fig. 11, put it back into the wood model. If necessary tie a string around the pieces to hold them in place. Also before putting the core into the model, place in the bottom of the model a thin strip of wood; about ¼ of an inch thick will be thick enough. This will allow the core to project ¼ of an inch above the sides of the model, as shown in Fig. 12. Taper this ¼ inch projection of the core as shown, and then place in position on the outside of the model the outside plaster molds which have already been made. Tie a string around these to hold them firmly in position.

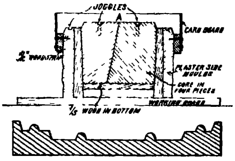

Fig. 12.—PARTS ASSEMBLED FOR CASTING THE PLASTER CASE, ALSO SECTION OF THE PLASTER CASE.

Now secure by means of brads or fresh plaster strips of ½ inch wood around the outside mold as indicated, about ¼ of an inch from the top. Taper the edges of the plaster mold from the point where the wood is attached to the top as indicated. This can readily be done by cutting the plaster with a knife.

Joggles or holes should be made in the top of the outside plaster mold as well as in the top of the pieces of the core as indicated. These will help greatly in holding together as well as in assembling the various pieces of the mold. Now secure to the strips by means of tacks a 1 inch strip of heavy cardboard around the entire outside mold. Shellac and oil well the entire inside of the inclosure thus made. Now mix your plaster as before, and pour it over the top of the core, the model and the top of the outside plaster mold. The cardboard sides and wood strips already attached will prevent the plaster from running down the sides. Smooth the plaster off level with the top of the cardboard and let it set or harden. When hard turn the whole upside down, and by gently jarring the piece just cast will come off freely. This piece is called the case. It will have the form shown in section in Fig. 12, and is used as shown in Fig. 13 for setting up the core and outside plaster mold in which to cast the cement box. In fact it forms part of the mold.

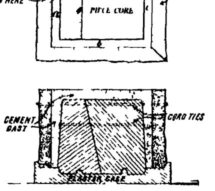

Fig. 13.—PLASTER MOLD SET UP FOR CASTING CEMENT.

Before casting the cement box it will be well again to shellac and oil all parts of the plaster mold which will come in contact with the cement Then set up the mold as shown in Fig 13, care being taken to bind the outside form firmly together by means of string The mold is now ready to receive the cement mixture which should be made as follows Take 1 part of Portland cement and 2 parts of marble dust, if a fairly light color is desired If not, 2 parts of any good clean fine sand will do Mix these thoroughly together while dry and then add enough water to allow the whole to be mixed to the consistency of a heavy cream Let it be thin enough so that it will pour freely Pour this mixture in the openings *a*, *b*, *c* *d* between the outer plaster mold and the core until the mixture is flush with the bottom of the core Lift the mold and gently jar it This will tend to settle the cement and will also force out any air that may be in the mold and thus avoid the trouble of air bubbles or voids in the finished cast The cement already deposited in the sides will settle more or less under this treatment Now fill the remaining portion of the mold flush with the top of the outside plaster sides and jar the mold again Repeat this operation until the cement will settle no more Wipe off the top of the mold with a straight edge thus removing any surplus cement and giving to the bottom of the box a good even surface Then place the mold in a level position and allow it to stay there without moving for from 24 hours to 48 hours the longer the better as the longer it is allowed to remain the harder the cement will set After having set for the above-mentioned time the piece can be removed from the mold The method of doing this is as follows

Turn the mold over into the position shown in Fig 12 tap the case *A* around its edges this will loosen the case which is then removed Now take the screw eye and insert it in the hole in the piece 1 of the core Pull this out and then repeat the operation in pieces 2 3 and 4 of the core Cut the string which binds the sides together and then pull them off in the directions indicated by the arrows in Fig 10

If care has been taken throughout all of the above operations the result will be a perfect cast The next step is the curing of the box This is a simple operation All that is necessary is to soak it well with water This can be done by placing the cast directly in water and letting it stay there for one or two days or it can be sprinkled or dashed with water three or four times a day for two or three days in succession or longer the longer the process is kept up, the better the result By the application of plenty of water the product produced will become as hard or harder than stone

(*To be continued*)

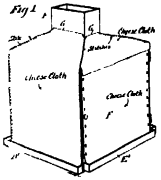
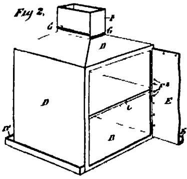
ICELESS REFRIGERATION

BY EDWARD THORPE

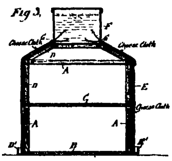
While the mad race for supremacy between the mercury and price of ice continues much comfort can be taken in the fact that there are other methods of keeping victuals cool besides that of melting ice in an ice box If in changing from the solid to the liquid state water absorbs sufficient heat to keep an ice box cool it is equally true that a change from the liquid to the gaseous state will result in refrigeration provided of course the rate of vaporization keeps pace with the heat which enters the ice box from the outside atmosphere Under proper conditions it is possible by this method to maintain a sufficiently low temperature in the ice box to preserve food from rapid decay A simple method of making such an iceless refrigerator is illustrated in Fig 1 In this illustration the cover of the water tank is removed The box comprises a frame *A* which is built upon a wooden floor *B* The frame *A* serves as a support for a zinc box *D*, which is fastened thereto The water tank *F* is soldered to the top of the box while at the bottom is a trough *D'* The door *E* at the front of the box has its own trough section *E'* Slots *G* are cut in the four sides of the tank *F* to receive the ends of a cloth cover for the box The cover is preferably made up of several thicknesses of cheesecloth stitched together at the corners, and the ends are jammed tightly through the slots into the water tank *F* The door *E* is provided with its own section of cheesecloth, as indicated in the illustration In operation the water from the tank soaks into the cheesecloth and by capillary attraction and gravity passes on down to the bottom of the cloth, where any excess of water is caught in the trough The flow of water through and over the cloth should be very slow, and may be regulated to a large extent by the tightness with which the cloth is stuffed into the slots *G*



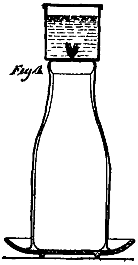
REFRIGERATOR COMPLETE WITH TANK UNCOVERED



CLOTH REMOVED TO SHOW THE ZINC BOX



CROSS-SECTIONAL VIEW OF REFRIGERATOR.



HOW TO KEEP A MILK BOTTLE COOL.

The box is placed on a suitable shelf supported by brackets just outside of the open window on the breeziest side of the house and out of the direct rays of the sun It is advisable to make the box a couple of inches narrower than the window opening so that the currents of air passing in and out of the window may have free passage all around the moist cheesecloth As the water in the cheesecloth is evaporated it absorbs a large amount of heat, much of which is taken from the zinc box tending to keep the food in the box cool A modification of this idea is shown in Fig 4 Here the construction is adapted to cool an individual milk bottle The cloth covering is placed directly over the bottle and at its upper end is jammed into a slot in the bottom of the small reservoir The milk bottle is placed in a saucer which serves as a trough to catch the excess of water Instead of the cheesecloth covering the leg of a sock can be used as this is already of cylindrical form and is well adapted to hold the moisture In case the water from the tank does not moisten the cover sufficiently the trough may be also filled and the water will be drawn up therefrom by capillary attraction

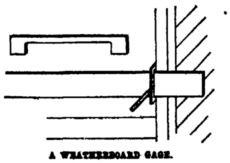
A WEATHERBOARD GAGE

BY I G BAYLEY

It is customary when cutting off weatherboarding to fit up against the corner strips of a frame house to use the long square or carpenter's rule The square is sometimes held along the edge of the weatherboard or down the side of the corner strip Either method necessitates carrying the square along or fetching it from where it was laid down

One-quarter the time can be saved saying nothing of the convenience by making a little gage as illustrated from a piece of board about 9 inches long and 2 inches wide, which can be carried in the nail or apron pocket The notch in the piece is 6½ or 7 inches in length and about 2 inches deep

The weatherboard is held in position, the end not shown being set firmly against the last board in the same row, the other end extending beyond the corner strips. The gage is slipped over this end of the board, and held firmly against the inside face of the corner strip, while a pencil line is quickly drawn across the board as it is held against the gage The saw cut is made a little inside the pencil mark.



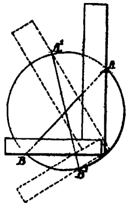
A WEATHERBOARD GAGE.

* * *

QUICK MEANS FOR FINDING THE CENTER OF SHAFTS.

BY ALBERT PRATHER.

In the illustration the circle represents a section of a shaft, the center of which it is desired to find. The corner of a square is placed on any point of the circumference The points *A* and *B* are the intersections of the outer sides of the square with the circumference. Draw a line from *A* to *B* Now shift the square a little as represented by the dotted square, and with the corner on any other point mark the intersections *A'* and *B'*, then connect *A'* and *B'*, and the intersection of *A B* and *A' B'* will be the required center It is necessarily the center, for it is the intersection of two diameters.



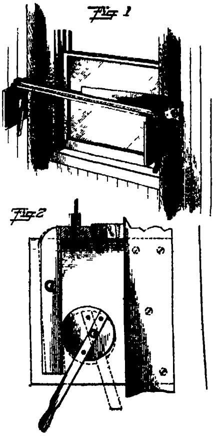
METHOD OF FINDING CENTER OF A CIRCLE.

* * *

A HOME-MADE SAW VISE.

BY JAMES G NEWLAND.

Desiring a saw-filing vise that would allow an ordinary saw to be filed or set from end to end without change and without chattering, to hold the saw rigidly and yet so that it could be instantly released the writer made a device as follows In the barn loft there was a south window with a good light. To the 2 x 4 studding at each side of the window and at right angles to it at a convenient height two pieces of wood 1 x 12 x 12 inches were firmly nailed, thus forming two brackets Two pieces of straight 2 x ¼ inch flat iron, long enough to go across these brackets, were found, also two straight pieces of 1 x 1 inch iron (discarded square-bed carriage axles with stubs off) The latter pieces were faced with the flat iron by means of a couple of countersunk head stove bolts Two pieces of 2 x 2-inch angle iron would have done as well These made the two jaws of the vise and they were placed across brackets in front of the window, with a wooden strip between the inside jaw and the studding to take the file thrust. On the inner side of each bracket a lever of 1¼-inch square hardwood was pivoted with its upper end bearing against the outer jaw. Two circles of wood were cut and mounted on bolts in the brackets, but an inch off center, so that they could be used as cams to press against the lower ends of the lever and force the upper ends firmly against the outer jaw, thus clamping the saw firmly in place. A handle was secured to each cam, with which to tighten and release the vise.



A HOME-MADE SAW VISE.

RECENTLY PATENTED INVENTIONS.

Pertaining to Apparel.

HAIR-RIBBON PIN.—W. M. YEOMANS, Hancock, N. Y. In this case the object of the inventor is to provide a new and improved hair ribbon pin, more especially designed for use on women's hair to securely hold a hair ribbon, to display the bow thereof to the greatest advantage and to give the pin a buckle appearance.

Electrical Devices.

PROCESS FOR OXIDIZING ATMOSPHERIC NITROGEN BY ELECTRICITY.—D. HELBIG, Rome, Italy. This invention consists in employing an electric high pressure flame are blown in a special manner by means of air for the purpose of oxidizing atmospheric nitrogen. The quantity of energy which becomes effective every moment, remains practically constant.

TELEGRAPH REPEATER.—E. LONGORIA, Monterey, Mexico. When one side of the repeater is working, vibrations are not produced on the reverse side, because the repeating contacts are arranged in such a manner that long before the first one opens the second is closed. Its work is safe and precise as the closing of contacts are made through the use of independent springs for each of them, and they have a uniform tension. It works with less local battery than any system, as the force produced by this latter is not used to close the contacts, and to open them the pressure of the natural weight of the arm of the repeater is almost sufficient, and thus the sound is clear and sonorous.

ELECTRICALLY-OPERATED PRICE-CARD.—P. L. DIBBINO, Spokane, Wash. The invention relates to signs, the more particular object being to produce an electrically-operated price card of simple construction. The effect upon the eye is simply that one legend, together with the light for exhibiting it disappears, and that the other legend, accompanied by the light for exhibiting it makes its appearance, the legend thus being presented alternately to the gaze of the observer.

Of Interest to Farmers.

CULTIVATOR.—A. HERMLINGHAUS, Hanover, Kan. This invention relates more particularly to a form of disk cultivator. The patentee has provided a very simple and light construction of frame and cultivator supporting members which afford a very wide range of various adjustments to position the cultivators to adapt the implement to the particular work in hand.

STACKER.—W. T. MCCALL and D. L. ORENDORFF, Manhattan, Kan. The device is for use in the field for elevating and piling up hay or grain into stacks and primarily for the purpose of stacking grain which has been cut by a header in which the heads of grain with a small proportion of the straw are received into a box like receptacle and is elevated to pile the same in suitable stacks.

Of General Interest.

LUNCH BOX.—F. J. BIRD, New York, N. Y. The invention refers to improvements more particularly to that type of portable lunch boxes in which separate food drawers or compartments and a separate liquid receptacle are provided, together with means for heating the liquid receptacle and if desired certain of said food compartments.

FOLDING BOX.—C. F. WRENSHALL, Owen Sound, Ontario, Canada. In the present patent the invention is an improvement in folding or knock-down boxes whose sides and ends are hinged together or otherwise so connected as to lie parallel when folded. The box is well adapted for various uses and may be constructed in any size required.

REVOLVING SIGN.—M. HEIM, New York, N. Y. This device may be set and kept in motion by very light currents of air. The bearings are constructed to develop no appreciable friction either at first or after the sign has been in use and exposed to the weather for an extended period. The tendency of the sign to revolve is increased by providing each of its heads, or its opposite ends, with outwardly extending vanes which incidentally add to the ornamental appearance of the sign.

SOUVENIR.—E. C. RICHMOND, Tacoma, Wash. The souvenir consists of a body having the opposite side faces inclining inwardly from each end toward the transverse center and having the edges scored to simulate a package of shingles, the representation being further perfected by placing cross-bars at opposite sides of the contracted central portion of the body, joining the adjacent ends of the bars by metallic straps and nailing the overlapping ends of the straps and bars to the body.

NON-REFILLABLE BOTTLE.—T. W. LEONARD, Richmond, Va. The construction preserves the appearance of the bottle and strengthens the bottle neck where desired. The bottle can be easily filled and sealed and while the dispensing of the contents can be readily accomplished, the sealing devices being adapted to move from sealing to unsealed position for such purpose.

SAFETY WATCH-GUARD.—L. FREEDMAN, New York, N. Y. The invention relates to certain improvements in that type of devices adapted for securing a watch chain or fob to a watch, and at the same time fastening the watch to the edge of a pocket or other portion of a garment, so that the watch cannot accidentally fall out or be surreptitiously extracted.

Hardware.

CLAMP.—T. NEWTON and H. JOURDAN, Camden, N. J. The clamp is for leather and other goods in which a member is provided with a flange at one end and arms to which are pivoted a movable member having a flange which is adapted to engage the flange on the first-named member, there being shoulders on the pivoted member against which a spring presses to hold the pivoted member firmly in an open or closed position, the spring being secured to the first named member.

HINGE.—H. E. HOKE, Hanover, Pa. The inventor's object is to provide a hinge more especially designed for use on either the right or left shutter and arranged to permit convenient hanging of the shutter, to prevent the shutter from falling off on an upward pull when closing the shutter, and to hold it against accidental closing when in an open position.

LOCK FOR SLIDING DOORS.—J. A. BENEDICT, New York, N. Y. The invention comprehends a plate mounted upon a movable door and sunken thereinto, the plate being provided with a pivotally mounted bolt for engaging the plate by entering the recess thereof, the arrangement of the parts being such that the swinging plate may be swung back into a normal position of inactivity or may be temporarily secured relatively to the plate in the movable door member.

Heating and Lighting.

OIL-BURNER.—W. S. ROBINSON, Fresno, Cal. The invention relates to oil burners adapted for use in cooking stoves, heating stoves or for any or all other purposes where oil is used as a fuel for generating heat. The special object is to provide means for vaporizing the oil and means for controlling the draft of air to the burner.

Household Utilities.

WINDOW FIXTURE.—A. F. GIROUARD, Leominster, and F. A. PERRON, Fitchburg, Mass. The object of the invention is to provide a fixture combining means for supporting or holding a curtain pole, shade roller and blind, the fixture being easily applied to the window casing without the use of nails, screws or other similar fastening devices.

BOILER-STAND.—S. S. STAHL, Connellsville, Pa. The object in this case is to provide an adjustable stand which may be varied to receive boilers of different diameters and also varied in height so as to support such boilers at a proper distance from the floor in order to make connections with the heating apparatus.

COMBINED TABLE AND LAMP STAND.—M. F. KOCH and M. KOCH, New York, N. Y. This invention has in view a combined table and lamp stand such as may be easily moved from place to place and support articles accessible from a bed, chair or other convenient position, the lamp being adjustable over the table to direct the light to any required point.

CONVERTIBLE BED AND MATTRESS THEREFOR.—L. B. JEFFCOTT, New York, N. Y. The object here is to provide a bed and mattress arranged to permit of conveniently converting the bed to form a davenport, a single bed, a double bed, or a couch, the mattress conforming to the changes thus requiring no separate mattress for the different forms in which the bed is used.

FOLDING BED.—L. B. JEFFCOTT, New York, N. Y. The inventor provides a two-unit folding bed or couch arranged to permit of collapsing one bed unit and passing it under the other bed unit in such a manner that the mattress, blankets, bed clothes, pillows and other bedding of the collapsed bed unit remain undisturbed and are accommodated in the space between the extended and the collapsed bed unit.

FOLDING BED.—J. RANKO, New York, N. Y. The invention includes a special form of support for the mattress, the support being resiliently carried by the frame. An object is to provide a folding bed frame which when extended forms a comfortable couch or cot, and which can be folded into compact form so that it can be easily moved from place to place, shipped or stored.

Machines and Mechanical Devices.

MOTOR.—A. P. BARNES and O. SCHMITT, Bolckow, Mo. The aim in this invention is to provide a motor with twin escapement wheels which are engaged by pallets mounted on pallet arms, the arms being pivoted to a rocking head and being adapted to rest against the peripheries of the escapement wheels so that the pallets will be lifted from recesses in the escapement wheels periodically during the operation of the motor by the contact of the arms with the wheels at increasing distances from the pallets.

SOUND-REPRODUCER.—B. B. SMITH, New York, N. Y. Of the many purposes of this invention, one is the provision of means to increase the sensitiveness of the stylus lever as regards its movement toward and from the general position occupied by the diaphragm, another is to provide means to enable the stylus lever to be played with various records having different types of sound grooves by merely throwing one jewel or record point out of service and another into service, both jewels being permanently carried by the stylus lever.

FILTERING-MACHINE.—R. T. WILDER, El Paso, Texas. The invention relates more particularly to such machines as operate centrifugally to force the substance to be filtered through the filtering media. An object is to provide a machine having a rotatable casing and a helical screw adapted to centrifugally separate the solid matter from the liquids in which it is held in mechanical suspension.

TYPE-BAR.—L. F. TALIAFERRO, Colorado Springs, Colo. The invention relates more particularly to type bars used in connection with writing machines and the like. One of the objects is to provide a type bar for producing a plurality of original duplicate impressions by a single movement of the bar.

ANIMAL-TRAP.—J. SNOW, Falun, Minn. This trap has an open bottom permitting an animal to put its foot clean through the trap so that the trap will become fastened well above the foot. The trap will throw its jaws up the leg of the animal some distance, making it impossible for the animal to escape by chewing away its foot, which is often the case with the old style trap.

STAND FOR GRINDING-WHEELS.—C. J. SOLES, Kankakee, Ill. The purpose here is to provide details of construction for a machine which will enable the instant arrest of motion of its grinding wheels and a resumption of rapid rotary motion therefor as may be desired, the improvement dispensing with the employment of a countershaft and change wheels as well as shifting gear therefor usually provided for each machine.

PIPE-REAMER.—W. F. PORTER, Duke Center, Pa. This improvement is in the nature of a novel construction of pipe reamer for reaming out the ends of pipes or tubing, such for instance as oil well tubing, and it consists in the novel construction and arrangement of parts whereby a reamer is provided which is adapted to ream out tubes or pipes of varying diameters.

POWER-SCOOP.—J. P. LORCH, New York, N. Y. An object of this inventor is to provide improvements whereby if the scoop in advancing should meet an obstruction such as a projecting manhole cover or the like it may slide backward and in doing so reach a higher level and pass over the obstruction, the scoop being immediately returned to its original position by means of a compressed elastic medium or member.

ABSORPTION REFRIGERATING-MACHINE.—T. J. KIRK, Louisville, Ky. The device while freeing the ammonia gas from the moisture contained therein and returning the latter to the generator acts at the same time as an economizer of heat by preheating the aqua ammonia before it is returned to the generator so that the latter is raised to a considerable temperature and therefore does not require the same amount of heat to drive off its ammonia that it otherwise would.

Railways and Their Accessories.

WAY-BILL.—F. H. CRUM, Los Angeles, Cal. One purpose of the invention is to provide an interline way bill having coupons similar to a passage ticket which furnishes each road over which the freight passes with sufficient information to enable it to provide the proper revenue accruing from the service performed.

TORPEDO.—F. L. S. ANDREWS, West Windham, N. H. The invention comprises a plate which forms a saddle or seat upon the head of the rail to which there is attached a receptacle for an explosive. This receptacle is in the form of a flattened tube, and the object is to arrange the latter so that the pressure of the wheel which discharges the torpedo will hold the ends of the tube closed. In this way the bursting of the receptacle by the force of the explosion is insured and also a loud report.

RAILROAD-TIE.—J. A. MCCORMICK and F. F. THRASHER, Cumberland, Md. The improvement pertains to railroad ties and more particularly to ties each comprising a body and pivoted end sections arranged to swing into longitudinal alinement with the body and like the latter having lips adapted to engage rail bases to clamp the rails in position.

BOX-FREIGHT CAR-DOOR.—G. W. LOUGHMAN, Berwick, Pa. The object here is to provide box freight cars, also barns, carriage houses and other inclosures with an improved door adapted to slide parallel to the side of the car or other structure and to swing into the doorway thereof so as to lie flush with the adjoining sides of the same and to be locked thereto.

NUT-LOCK.—E. M. LOVETT, Stanberry, Mo. This invention of this patentee is the result of an effort to practically improve the nut lock devices intended mainly for preventing the loosening of nuts in railroad joints. The patent discloses a plurality of washers of special construction, the inner one of which receives the nut and is locked with the outer washer, the latter in turn being so disposed in relation to the fish plate and rail that the whole is held against turning until purposely released.

CAR-FENDER.—H. FAJANS and A. M. CHAMBERS, New York, N. Y. The fender consists of a fender frame, an upright frame, arms adjustably and pivotally supported at their inner ends from the car and at their outer ends pivotally supporting the fender frame intermediate its length and having a sliding connection therewith, a slide carried by the upright frame, a net connected to the forward part of the fender frame and to the slide, means to hold the outer end above the ground and swing it to the ground when it strikes an object received in the net, and means to automatically lock the inner portion of the fender frame in its upper position.

MINE-CAR.—T. W. WEAVER and C. B. WEAVER, Hamilton, W. Va. The aim in this case is to provide a device which will securely lock the end gate of a car and which will be automatically released when the car has reached a predetermined point so that the contents of the car will be easily discharged.

Pertaining to Recreation.

PLEASURE RAILWAY.—W. I. MANGELS, New York, N. Y. This railway is for use in pleasure resorts and the like, and is arranged to enable the passengers on a vehicle to assist in propelling the power-driven vehicle, thus providing an exhilarating and healthy ride and permitting several vehicles driven uniformly by power to race, the hand power supplied by the passengers being the determining factor of the race.

AQUATIC MERRY-GO-ROUND.—H. F. RIEHL, New York, N. Y. The object of the inventor is to provide a merry-go-round arranged to afford an exceedingly novel and highly interesting ride. The passengers in a car undergo several movements, that is, are carried bodily around with the platform, are moved up and down and turn alternately with the car around in opposite directions.

Pertaining to Vehicles.

TIRE-PATCH.—J. A. WHEELER, Onaway, Mich. An object of this invention is to provide a device by which the worn outer surface of a rubber tire may be protected and which may be readily applied without the necessity of special tools. A further object is to provide an emergency patch which may be cheaply made from old tires which have been discarded.

DRAFT-EQUALIZER.—F. COOK, Portland, Maine. The equalizer is adapted to be detachably connected to vehicles, plows, etc., and having a double tree adapted to rock on a block with which it engages at opposite sides when thrown to reverse angular positions, and at the center when moved to an equalized position, the block and tree further having V-shaped or other engaging stop portions at the rear of the block and the block having a rearwardly extending hook for detachably applying it to certain forms of appliances.

DESIGN FOR A CUT-GLASS DISH.—R. H. LITTMAN, Honesdale, Pa. In this ornamental design for a cut glass dish the form of the dish is circular and the ornamentation simply comprises a cluster of three flowers and their leaves in the center or base of the plate and the same type of flower running around the rim.

BICYCLE.—J. DE LAURO, Philadelphia, Pa. Mr. Lauro the inventor shows a very interesting form of actuating device and structural features of a bicycle, the improvements more practically relating to means for mounting the cranks and the arrangement of clutches co-operating with the cranks to control the actuating sprocket wheel.

TIRE.—J. C. RAYMOND, New York, N. Y. The object of the present invention is to provide a tire arranged to permit of quickly disconnecting the tire from the rim of the wheel for repairs or other purposes and replacing the tire and securely locking it in place on the rim. It relates to tires such as shown and described in Letters Patent of the U. S. formerly granted to Mr. Raymond.

HITCHING DEVICE.—H. A. WITTSTEIN, Hazleton, Pa. The invention relates to hitching devices for use in connection with horses. One object of the invention is to provide an improved device for supporting and retaining a hitching weight and for connecting the same to a bit or reins of a horse. It provides means for engaging the hitching rein or rope to prevent tension so as not to induce backing up.

ATTACHMENT FOR DOUBLETREES.—J. T. AYRES, Remington, Ind., and C. A. FISHER, Clarksville, Ark. The purpose of this invention is to enable the double tree for applying draft force to a load to be positioned at a proper distance from its longitudinal center in engagement with the load and thus by the leverage afforded at one end of the double tree even the load to be drawn, if a strong horse or team is hitched to the shorter arm of the double tree and a weaker horse or team is connected with the longer arm thereof.

Designs.

DESIGN FOR A BADGE.—A. F. PARKER, Brooklyn, N. Y. The design in this case represents a badge comprising an ornamental and symmetrical arrangement of a horseshoe, three clover leaves, and a swastika.

NOTE.—Copies of any of these patents will be furnished by Munn & Co. for ten cents each. Please state the name of the patentee, title of the invention, and date of this paper.

Classified Advertisements

Advertising in this column is 75 cents a line. No less than four nor more than ten lines accepted. Count seven words to the line. All orders must be accompanied by a remittance. Further information sent on request.

READ THIS COLUMN CAREFULLY. You will find inquiries for certain classes of articles numbered in consecutive order. MUNN & CO

PATENTS FOR SALE

HOT WATER CIRCULATOR.—Greatly economizes fuel. Outright or royalty. Quick circulation and regulation to any distance in any hot water heating system. Address A. E. Crowhurst, Humber Bay, Ontario, Can.

Inquiry No. 8868.—Wanted to buy nickeloid for buttons.

FOR SALE. Outright or on royalty U. S. and Canadian patent on spiral punch. A long felt want filled for the operators of machinery. All interested in an instrument with unlimited field and great demand write for particulars, claims, drawings and any information desired to Harry C. Roberts, Rowland, N. C.

Inquiry No. 8908. For a dealer in tapes and cords for Venetian blinds.

FOR SALE or on royalty U. S. patent No. 99,845. Lift strap for recumbent patients. Address R. Box 777, N. Y.

Inquiry No. 8918. For manufacturers of "Wydt's Electro-Catalytic Sparking Plug."

FOR SALE

FOR SALE.—Specialty for manufacturers. Dental floss holder patented May 1908. For further particulars apply direct to inventor T. A. Tubin, Seattle, Wash., care H. B. Emerson Company.

Inquiry No. 8921. For the manufacturers of gilt paper.

HELP WANTED

MECHANICAL ENGINEER wanted for charge of designing and drafting office for large engineering works. Give experience. Address Canada Foundry Company, Ltd., 212 King St. West, Toronto, Canada.

Inquiry No. 8923. Wanted the address of Worthington Boiler Co.

YOUNG MAN graduate of some school in mechanical engineering for position in woodworking plant in small Tennessee town. Good opportunity for advancement. State experience, if any, and salary. Answer "Position," Box 773, New York.

Inquiry No. 8928. For the manufacturers of a steam rotary excavator as described in the Scientific American of December 1, 1908, page 347.

PARTNERS WANTED

PARTNER WANTED with small capital to promote several patents. L. Feldra, 89 Congress St., Jersey City.

Inquiry No. 8931. For parties who manufacture the Western Stump Borer for boring stumps.

LISTS OF MANUFACTURERS

COMPLETE LISTS of manufacturers in all lines supplied at short notice at moderate rates. Small and special lists compiled to order at various prices. Estimates should be obtained in advance. Address Munn & Co., List Department, Box 773, New York.

Inquiry No. 8941. For manufacturers of machinery for making fly screens.

A LIST OF 1,500 mining and consulting engineers on cards. A very valuable list for circularizing, etc. Price $15.00. Address Munn & Co., List Department, Box 773, New York.

Inquiry No. 8960. For the address of the Windsor Mfg. Co., manufacturers of waterproof collars and cuffs.

Inquiry No. 8966. Wanted the address of the Cohendet Motor Co.

Inquiry No. 8969. Wanted machines that make accordion dress plaiting (steam).

Inquiry No. 8971. For address of firms interested in fishing reels.

Inquiry No. 8977. For manufacturers of machinery for manufacturing denatured alcohol.

Inquiry No. 8978. Wanted the address of manufacturers of dry pans or crushers to grind sand for plastering and cement works.

Inquiry No. 8980. For the address of manufacturers of mortars and pestles that are used by druggists.

Inquiry No. 8981. Wanted the address of the manufacturers of Cypress wash tubs.

Inquiry No. 8986. Wanted to buy crown and flint glass for telescope objectives.

Inquiry No. 8987. Wanted the manufacturers of the Van Winkle, Wood & Sons and the Weber power meters.

Inquiry No. 8990. For information regarding shoes not made of leather but similar to the same and are as durable.

Inquiry No. 8995. Wanted to buy round and oval glass paper weights such as are used for mounting photographs.

Inquiry No. 8996. Wanted addresses of manufacturers of machinery for working orange wood manicure sticks.

Inquiry No. 8997. Wanted the address of the manufacturers of bread or cake boxes.

Inquiry No. 8999. For manufacturers of combined clothes and clothes pin receptacle.

Inquiry No. 9000. Wanted a combined appliance for holding hats, coats and umbrellas safely and securely.

Inquiry No. 9001. For the address of progressive manufacturers of fruit jars.

Inquiry No. 9002.—For the address of the Varley Duplex Magnet Co. or anyone making and designing special electro magnets.

Inquiry No. 9003. For the address of parties who make "Invar" or other metals having a low coefficient of expansion.

Notes and Queries.

Kindly write queries on separate sheets when writing about other matters, such as patents, subscriptions, books, etc. This will facilitate answering your questions. Be sure and give full name and address on every sheet.

Full hints to correspondents were printed at the head of this column in the issue of March 18th or will be sent by mail on request.

(12111) C. B. says: Will you kindly inform me as to the principle of the electrolytic detector used in wireless telegraphy? A. If an electrolytic detector has a small electromotive force applied to it by a shunted cell of battery, the electrodes become polarized and the current is reduced practically to zero. When oscillations are sent through the cell in this condition, they destroy the polarization of the small electrode and the current suddenly increases, but it returns to its former small value when the oscillations cease. This explanation with a full discussion of the subject you may find in Fleming's "Elementary Radiotelegraphy and Radiotelephony," which we send for $2.

(12112) T. F. Van W. says: Can you tell me if the specific gravity of the moon is known, and if so, how it compares with that of the earth? A. The density of the moon is 0.61 that of the earth. One of the best determinations of the density of the earth is 5.527, reached by Boys in 1894. This would make the specific gravity of the moon to be 3.37.

(12113) C. S. says: 1. If we take two jars of equal inside diameter and fill both with equal quantities of alcohol and leave one jar open, but close the other with a cover with only a small opening through which the vapor can escape, will the alcohol evaporate in the same time from both jars, all other conditions being equal? A. The evaporation of any liquid takes place more slowly out of a bottle with a small mouth than out of one with a large mouth. 2. Does reflected sunlight differ in any way from direct sunlight? That is, will a plant grow as well if exposed to reflected as to direct sunlight, and will reflected light kill certain bacteria as well and quickly as direct sunlight? A. Ordinarily reflected light differs in no respect from the same light before reflection. The spectrum of moonlight is simply a fainter spectrum of sunlight. Any effect which direct light can produce will be produced by reflected light, except for the loss in brightness by reflection. 3. Does sunlight lose in intensity if reflected by a clear mirror? A. There is no perfect reflector. Light is lost by reflecting it from any mirror whatever. A metal mirror will reflect about 6/10 of the light which strikes it perpendicularly, and a mercury mirror about 75/100. The loss is larger if the light strikes the mirror obliquely.

(12114) R. J. T. asks: On April 22nd the A. Z.'s, a club of six young men, held a spirited meeting at the home of one of its members. The topic under discussion was: "Resolved that if a tree falls in the forest and there is no animate being present, there is no sound." After the discussion the judges awarded their decision to the negative, merely on the merits of the debate, however, not on the merits of the question. Not being satisfied on the merits of the question, however, as brought out in the material presented, the club would like to ask that you answer it in your paper. A. The answer to your question depends upon the definition of the word "sound" applied to the argument. In most dictionaries two definitions are given: 1. A sensation produced through the organs of hearing. In this sense, if there are no human or animal brains present to receive this sensation through the organs of hearing, there is no sound. 2. The physical causes of such sensation, waves of alternate compression and rarefaction passing through any substance, solid, liquid, or gaseous, but especially through the atmosphere. The sound waves are produced by the fall of the tree, whether or not there are organs of hearing present to receive them, and consequently in this sense sound is made though unheard.

(12115) J. R. D. says: May I ask your opinion re the following? What is the correct size and length of stove pipe to give a strong draft to a stove of the following dimensions? Diameter 6 feet, height to top of stove 3 feet, beyond that height a sloping dome about 4 feet, terminating in a stove pipe. At present I have a 10-inch stove pipe about 12 feet long. Draft below is supplied by leaving open the irregularities in the ground. The stove is intended to aid in burning out stumps, the idea being to bore and light the stump in the usual way and then place the stove over it to give a strong draft and suction, so that the roots as well as the stump would burn clean out. At present, with the stove pipe as mentioned, it does not appear to make much difference nor make the bored stump burn any longer than without it. Is the stove pipe too small for such dimensions? If properly proportioned, even if not successful in burning out the roots, it should make a very fierce fire by the draft and suction, which is not the case. A. We should not say that the dimensions of your stove pipe could be usefully increased or that combustion of the stumps would be more complete if the draft were increased. If we correctly understand your method of burning the stumps, a stage must be reached at which combustion can only be from the inside outward, especially when nearing the roots, after which the flame would have to travel against the draft, and the latter would be unlikely to help it. Such a method of destroying stumps must be slow at the best, as a block of solid wood would soon be covered with ash and consumed material, leaving no inflammable surface exposed to the flames.

NEW BOOKS, ETC.

FISH STORIES. By Charles F. Holder and David Starr Jordan. New York: Henry Holt & Co., 1909. 336 pages. Price, $1.75 net.

Prof. C. F. Holder is one of the oldest contributors to the SCIENTIFIC AMERICAN and he is well known to our readers. Prof. David Starr Jordan is president of Stanford University and is a well known ichthyologist. The authors are perhaps two of the most prominent amateur and professional students of fish in the country, and this volume tells their unusual fish exploits and their best fish stories. It is a delightful miscellany, telling about the strangest kind of fish with a strictly scientific description which melts almost imperceptibly into accounts of personal adventure. Unlike most fish stories they have a strong foundation in fact. It is a book which we can commend to the general reader as well as those who are slaves of the rod.

CHARACTERS AND EVENTS OF ROMAN HISTORY FROM CAESAR TO NERO. By Guglielmo Ferrero. New York: G. P. Putnam's Sons, 1909. 8vo., 275 pages. Price, $2.50 net.

The present work, which is very handsomely printed and bound, consists of a series of studies of the great men and great women of ancient Rome and critical moments and events in Roman history. Among the people and subjects treated are: Corruption in Roman History, the Legend of Antony and Cleopatra, Nero, the Relation of the Conquest of Gaul to the Development of Modern France, Julia and Tiberius, Wine in Roman History, and Roman History and Modern Education. Interesting, entertaining, picturesque, full of pregnant ideas, this volume of Prof. Ferrero's is sure to find an absorbed audience that will be richly rewarded for the close attention they will give it.

BIRDS OF THE WORLD. A Popular Account. By Frank H. Knowlton, Ph.D. With a chapter on the Anatomy of Birds by Prof. Frederick A. Lucas. The whole edited by Root Ridgeway. New York: Henry Holt & Co., 1909. Quarto, 872 pages, 16 colored plates, 236 illustrations. Price, $7.

There has been a great popular awakening in recent years in relation to our birds. It is only necessary to pay a visit to the American Museum of Natural History in New York to see evidences of the growth of this movement. The magnificent exhibits which are to be found in this building have done much to awaken interest in birds, as has also the work of the Audubon societies. The widespread nature teaching in our schools is also responsible for the increased interest in ornithology. Few of those who turn to the country either for recreation or for permanent residence have an inclination or desire to become professional ornithologists, but they have wished to know at least the names and facts in the life history of the birds that they see constantly about them. To supply this demand for popular information a large number of works have been written, and their extensive circulation proves that they have filled a real want, but most of these are more or less local in their scope, only a few treating of the birds of the whole world, so that the time seems ripe for a work of moderate size in a single volume which would set forth in non-technical language the salient facts regarding the birds of the world. The author has attempted to prepare such a work, and he has succeeded admirably in his task. The illustrations are excellent and numerous. The colored plates are well executed. It is a book which should be in every library as well as in every school library. The book is a portly one, and is handsomely bound.

MENDELISM. By R. C. Punnett. American Edition with Preface by Gaylord Wilshire. New York: Wilshire Book Company, 1909.

This is the second edition of a popular work on Mendelism which has won for itself a deservedly high place in current popular scientific literature. Why Mr. Wilshire should have burdened the book with a Socialistic Preface is more than we can understand. It is a far cry from Mendelism to Socialism.

LES PLANÈTES ET LEUR ORIGINE. By Ch. André. Paris: Gauthier-Villars, 1909. 285 pp. Price, 8 francs.

M. André's book is divided into three parts, in which the planets, satellites, and the formation of the planetary system respectively are described. Among the striking features of the

Two Good Books for Steel Workers

Hardening, Tempering, Annealing and Forging of Steel
By JOSEPH V. WOODWORTH
Size 6¼ x 9¼ inches. 288 pages. 201 illustrations. Price $2.50 postpaid

THIS is a practical work, treating clearly and concisely modern processes for the heating, annealing, forging, welding, hardening and tempering of steel, making it a book of great value to toolmakers and metal working mechanics in general. Special directions are given for the successful hardening and tempering of steel tools of all descriptions, including milling cutters, taps, thread dies, reamers, hollow mills, punches and dies and various metal-working tools, shear blades, saws, fine cutlery and other implements of steel, both large and small. The uses to which the leading brands of steel may be adapted are discussed, and their treatment for working under different conditions explained; also special methods for the hardening and tempering of special brands. A chapter on case-hardening is also included.

The American Steel Worker
By E. R. MARKHAM
Size 5¾ x 8 inches. 367 pages. 163 illustrations. Price $2.50 postpaid

THIS is a standard work on selecting, annealing, hardening and tempering all grades of steel, by an acknowledged authority. The author has had twenty-five years practical experience in steel-working, during which time he has collected much of the material for this book. Careful instructions are given for every detail of every tool. Among the subjects treated are, the selection of steel to meet various requirements, how to tell steel when you see it, reasons for different steels, how to treat steel in the making of small tools, taps, reamers, drills, milling cutters, hardening and tempering dies; pack-hardening, case-hardening; annealing, heating apparatus; mixtures and baths, the best kind, and why, and in fact everything that a steel-worker would want to know is contained in this book.

OUR SPECIAL OFFER: The price of these books is $2.50 each, but when the two volumes are ordered from us at one time we send them prepaid to any address in the world on receipt of $4.00.

book may be mentioned the author's arguments in favor of the rotation of Mercury and Venus, an excellent *résumé* of Poynting's temperature investigations, his summary of the evidence against the canals of Mars, and a fine chapter on minor planets The division on satellites discusses the various announcements of a satellite of Venus the Martian satellites and the recently discovered satellites of Jupiter The Laplace system and its inconsistencies are excellently discussed in the last division

Crude Rubber and Compounding Ingredients A Text Book of Rubber Manufacture By Henry C Pearson Editor of The India Rubber World Second Edition New York The India Rubber Publishing Company, 1909

This is the second edition of a book which appeared ten years ago and which may be regarded as a standard work on the subject in English Since the appearance of the first edition the rubber industry has made rapid strides. New sources of rubber have been opened up and progress has been made in reclaiming waste rubber In this revised edition the improvements in the art have all been conscientiously noted The many new compounding ingredients, substitutes and processes find a place in its pages As it stands the book is a dictionary of compounding facts and an encyclopedia of rubber factory practice, intended primarily for factory use

Atlas und Lehrbuch der Hygiene. Mit besonderer Berücksichtigung der Städte-Hygiene Herausgegeben von Professor Dr W Prausnitz Vorstand des hygienischen Instituts der Universität Graz München J F Lehmann's Verlag 1909

The science of hygiene is concerned with the preservation of the health of human beings Its study is based upon an accurate knowledge of the human organism and the effect of environment upon that organism Hygiene is either scientific or practical Scientific hygiene endeavors to ascertain everything that may have an effect upon health and to determine the conditions which are most favorable for the development of mankind Practical hygiene has for its object to apply the principles which have thus been scientifically discovered so as to reduce the dangers to human health In order to attain this object, practical hygiene requires innumerable technical installations which include not only the construction of a dwelling but everything that pertains to a dwelling Unfortunately this ideal has not as yet been reached because the engineer and the physician have not worked in perfect accord and also because the land holder is only *too* frequently prompted to build his structures as cheaply as possible It is the purpose of the work before us to set forth these principles of hygiene simply and clearly and yet accurately so that the public will acquire a broader knowledge of the development of a new and important science The book is intended not only to help the architect who draws the plans of the house and the builder upon whom devolves the duty of construction but it will serve the purpose of indicating to the factory or house owner what he owes his employees or the inmates of his house The book will also aid the client of the sanitary engineer to point out definitely just what he wants Hitherto he has been able to talk only vaguely because he had no concrete example to which he could point

Unsere Honigbiene Von Prof K Sajó Stuttgart Kosmos Gesellschaft der Naturfreunde Price, 60 cents

Prof Sajó is a well known contributor on natural and scientific topics, not only to Kosmos but to other periodicals as well. In this little book he has given a very clear and comprehensive description of the bee as a biological species and also as a useful insect

The Art of the Netherland Galleries By David C Preyor Boston L C Page & Co, 1908 12mo, 380 pp Price $2

This attractive volume is one of the series of the Art Galleries of Europe of which seven have already been published prior to the present volume which is the history of the Dutch School illuminated and demonstrated by critical descriptions of great paintings in the many galleries The wonderful and unique art of the Dutch School of the seventeenth century can nowhere be studied so completely as in the Netherland galleries Any work which tends to bring these masterpieces into closer touch with the visitor should be warmly welcomed The present volume is a painstaking appreciation of the art of the great masters of Holland The book is exceedingly well written and the illustrations reproduced in sepia tints are very much better than in the average work The paper is particularly light in weight and the book will be found a most enjoyable one for those who are fortunate enough to be able to visit the galleries in person while to those who stay at home the book will prove of genuine interest It is most attractively bound

The Resuscitation of Persons Shocked by Electricity By Edw Anthony Spitzka M D Professor of General Anatomy Jefferson Medical College Philadelphia 1909 Reprint from the Journal of the Medical Society of New Jersey

Pennsylvania Railroad

BULLETIN

908 Miles in 1080 Minutes

The "**Pennsylvania Special**" is the climax of development in railroad transportation It is operated primarily in behalf of the busy man

Under the train is the finest roadbed. Above the rails is the most completely equipped train On the train is a picked crew Alongside the tracks is the best Signal System. This combination makes for speed, regularity, safety, and utter comfort

The "**Pennsylvania Special**" has made good for many years. It is an asset to the business man He can recreate on it or work as humor or necessity dictates, but he is using the minimum of time in meeting his engagements.

Three quarters of the circumference of the clock-dial, all in the off hours, is its daily deed

The "**Pennsylvania Special,**" the pioneer 18-hour train between New York and Chicago, leaves New York every day at 3 55 P M and arrives in Chicago 8 55 A. M Returning it leaves Chicago 2 45 P M and arrives in New York 9 45 A M.

10 DAYS FREE TRIAL We will ship you a "RANGER" BICYCLE on approval, freight prepaid to any place in the United States *without a cent deposit in advance* and allow ten days free trial from the day you receive it. If it does not suit you in every way and is not all or more than we claim for it and a better bicycle than you can get anywhere else regardless of price or if for any reason whatever you do not wish to keep it, ship it back to us at our expense for freight and you will *not be out one cent*.

LOW FACTORY PRICES We sell the highest grade bicycles direct from factory to rider at lower prices than any other house. We save you $10 to $25 middlemen's profit on every bicycle—highest grade models with Puncture-Proof tires, Imported Roller chains, pedals, etc. at prices no higher than cheap mail order bicycles, also reliable medium grade models at unheard of low prices.

RIDER AGENTS WANTED in each town and district to ride and exhibit a sample 1909 Ranger Bicycle furnished by us. You will be astonished at the *wonderfully low prices* and the liberal propositions and special offers we will give on the first 1909 sample going to your town. Write at once for our *special offer*.

DO NOT BUY a bicycle or a pair of tires from *anyone* at *any price* until you receive our catalogue and learn our low prices and liberal terms. **BICYCLE DEALERS:** you can sell our bicycles under your own name plate at double our prices. Orders filled the day received.

SECOND HAND BICYCLES—a limited number taken in trade by our Chicago retail stores will be closed out at once, at $3 to $8 each. Descriptive bargain list mailed free.

TIRES, COASTER BRAKES, single wheels, inner tubes, lamps, cyclometers, parts, repairs and everything in the bicycle line at half the usual prices.

DO NOT WAIT but write today for our *Large Catalog*, beautifully illustrated and containing a great fund of interesting matter and useful information. It only costs a postal to get everything. Write it now.

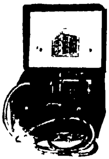
Lost Hearing Restored



Electro-Vibratory Apparatus

The only machine of its kind in the world. Fully protected by U. S. Pat. [illegible]

By the simplest, easiest, most practical and rational method ever discovered: ELECTRO VIBRATION. Not a new theory, not an experiment, but a proven practical everyday fact.

Deafness is not a disease as you may suppose, but is the result of certain causes, the removal of which is easily accomplished with the aid of the Powell Electro Vibratory Machine, one of the most remarkable inventions of recent years. The magnetic wave currents produced by this wonderful machine act as a gentle massage on the delicate organs of the inner ear, stimulating them to renewed activity, thereby causing them to perform their natural functions. You can then hear perfectly.

If medical science has failed in your case, if the various ear drums and other devices claimed to restore lost hearing have failed to give you desired results, and you are willing to test the most successful method in the world for restoring lost hearing, just write today for full particulars, and learn how you may regain your hearing right in your own home, free of charge.

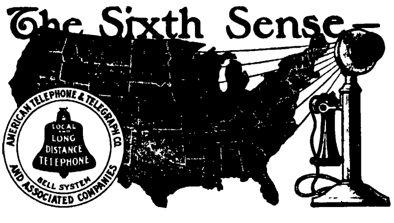
The Sixth Sense



AMERICAN TELEPHONE & TELEGRAPH CO.
AND ASSOCIATED COMPANIES
BELL SYSTEM
LOCAL AND LONG DISTANCE TELEPHONE

An American's sense of projecting himself far beyond the skies and hills of his forefathers is largely responsible for his self-assurance—for his mental vigor and the progress which this has meant.

The Sixth Sense, the sense of projection—is due to the telephone. It is due to the *Bell telephone system* which at any instant conveys *his personality*, if not his person, to any part of the country. It carries his voice with *directness* to the ear of the person wanted. Carries it with its *tone qualities* and *inflections* - things which are *vital* to the expression of personality.

Bell telephone service is more than a mere carrier of messages. It is a system of sensitive wire nerves, carrying the perception-message to the nerve centre and the return message simultaneously. *It is the only means of communication which thus carries the message and the answer instantly.* While *you* are projecting *your* personality—the strength of your individuality, to the distant point, the party at the other end is *projecting his* personality, at the same instant and by the same means, to you.

You are virtually in two places at once

Though this service is in a class by itself, the Bell telephone has no fight with the other public utilities. Its usefulness is dove-tailed into *all other utilities*. Each of the others is unquestionably made more effective by the Bell telephone.

A telegram is delivered from receiving office to house by *telephone*. The more people telegraph, the more they *telephone*. The more people travel, the more they *telephone*. The more energetically a man pursues business of *any* kind, the more he needs and uses the *telephone*.

The universal Bell telephone gives every other utility an added usefulness. It provides the Nation with its Sixth Sense.

A business man has one important arm of his business paralyzed if he does not have a Long Distance Telephone at his elbow. It extends his personality to its fullest limitations—applies the multiplication table to his business possibilities. It keeps things moving.

The American Telephone and Telegraph Company
And Associated Companies

Every Bell Telephone Is a Long Distance Station

Big Money In Drilling

Our customers all over the Country are making from $25 to $75 profit a day with the Cyclone Drill. [illegible]

Contractors, prospectors, well drillers find the Cyclone Drill more economical, faster and easier to operate than any other.

We make Hollow Rod, Cable and Core Drills, to meet every need.

We also make combination machines that will handle any or all of the systems equally well, a machine that will enable you to cover the entire field of drilling.

Cyclone Drill

Our Diamond, Shot and Steel Shot Core Drills cut faster and at a fraction of the cost of the diamond drill. We sell Cyclone Drills on an *easy payment plan*. Some of our customers have made more than the price of the machine within one month. Our new traction gasoline machine is the only one made [illegible] where fuel and water are scarce. Send for our free book on Drilling, and let us know in what branch of the work you are interested.

CITY TERMINALS WITHOUT TRAFFIC CONNECTION.

The total lack of a co-ordinated plan (or shall we say of coordination of effort?) in the provision of transportation facilities in New York city is forcibly brought to the notice of the public by a letter of Vice President Rea of the Pennsylvania Railroad Company to Chairman Willcox of the Public Service Commission, which draws attention to the fact that when the Pennsylvania's new station at Seventh Avenue and 33rd Street, New York, is opened to the public in the summer of 1910, it will be without any connection with the rapid transit system of the city.

The predicament in which the magnificent new terminal will find itself has its parallel in the history of the three great bridges across the East River. The Williamsburg Bridge stood for several years after its completion completely isolated from the elevated railroad systems of Manhattan and Brooklyn, and it was only recently that the costly elevated approaches to and roadways on the bridge were placed in service. The great Queensboro Bridge, opened a few months ago, is likewise without any rapid transit or elevated railway connections, and the present indications are that the new Manhattan Suspension Bridge, which will be completed within a year, will find itself in the same predicament. The case of the new Pennsylvania terminal will be particularly aggravated, since it will not only bring all the express trains of America's greatest railroad into the city, but it will also serve as the gathering and distributing center for a large suburban travel from New Jersey and from the extensive and populous residential districts of Long Island.

Obviously the most satisfactory plan for placing the Pennsylvania terminal in immediate touch with the subway system would be to build an extension of the existing subway south from 42nd Street through Seventh Avenue to the Battery. This is the plan advocated by the Pennsylvania Company, and as far back as 1906 such a route was laid out by the old Rapid Transit Commission as part of a complete system through Manhattan and the Bronx, the northerly portion of which was to be built up Lexington Avenue from 42nd Street to provide the east side with greatly needed facilities. This route is indorsed by the present Public Service Commission. The failure to build the line must be laid at the door of the Interborough Company, which operates the present subway, for it was not until last June that the offer of this company to construct such a line was received by the Commission, who have the proposal now under consideration. The traveling public has no interest in the controversy as to where lies the responsibility for the delay, but it is tremendously interested in having this line constructed with the least possible delay. We are well aware that there are other rapid transit routes before the Commission, for each of which their particular sponsors claim special advantages and the necessity for immediate construction; but in view of the importance of the new Pennsylvania terminal as a distributing center and of the pressing need for another four-track line south from 42nd Street to the Battery, we believe it will be the consensus of opinion that this line should be one of the first, if not the very first, to be authorized, and that the contractors and the Public Service Commission should join hands in rushing it to an early completion.

MAGNITUDE OF WORK ON NEW STATE BARGE CANAL.

The stupendous engineering work which the United States government is carrying through at the Isthmus of Panama so completely fills the public eye that very little is heard of that other great work of canal construction which is being executed in our very midst in the enlargement and reconstruction of the old Erie Canal between Buffalo and Albany. Certainly but few people outside of professional circles are aware that in point of magnitude of excavation the figures for the New York State Barge Canal rival, if they do not exceed, those of the Panama Canal. Admitting that there can be no comparison on the score of accommodations between a canal twelve feet in depth and one with a maximum depth of forty-five feet, it should not be forgotten that whereas the Panama Canal from shore line to shore line is but forty miles in length, the New York Barge Canal extends for nearly four hundred miles. Furthermore, the latter work involves the construction of thirty-four dams, fifty-three locks and seven guard locks, the construction of which is complicated by the fact that the canal being built through the most thickly populated section of New York State, the effect of these works on adjoining properties and water powers has to be considered and due precautions against damage taken, involving additional costs in time and labor.

It is in the comparison of the amount of excavation done, however, that the surprising fact is developed that the total amount of excavation and its equivalent in concrete structures, if compared for the same period of time, is found to be actually greater on the State Canal than on the national undertaking at Panama. Up to January 1st, 1909, the excavation on the Barge Canal amounted to 15,168,000 cubic yards, and if to this be added the concrete and other constructional work, the total cost up to that date reaches $8,701,000. On the Panama Canal, up to January 1st, 1908, the total amount of material taken out amounted to 22,2? 000 cubic yards, and up to that time practically no work had been done on the concrete structures. It is stated by the engineers that if the sum of money expended during the period under consideration on concrete and other structures on the Barge Canal had been paid for excavation at the prevailing rate, it would have been possible to remove an additional 10,417,000 cubic yards of material. This would have brought the total of excavation up to 2? 585,000 cubic yards, which would have been equivalent to an increase of twelve per cent over the amount of excavation done on the Panama Canal during the same number of years of operation. It is only fair in connection with these figures, however, to bear in mind that the present rate of excavation in Panama is far more rapid than that on the State Barge Canal. This, however, does not invalidate the force of the above comparison as showing the magnitude of the work now being done between Buffalo and Albany. It is greatly to be regretted that the canal enlargement was not planned on a more generous scale. When the canal is opened, the depth of twelve feet will appear to be pitifully insufficient in view of the fact that by that time the construction of the new Georgian Bay Canal, which will provide a depth of 21 feet from the lakes to deep water on the St. Lawrence, will in all probability be well under way.

WIRE-WOUND VERSUS STEEL GUNS.

In these days of big-gun ships and long-range fighting, the gun as one of the offensive elements of naval warfare has taken on an importance greater than it ever held before. In the engagements of the future, which will be fought at ranges of from four to six miles, accuracy of aim and large remaining energies of projectile become of prime importance. The most effective big gun for the new conditions will be that which will strike the heaviest possible blow, at the greatest possible range, with the lightest possible shell fired from the lightest possible gun. These ideal results, which can be obtained only in a gun of unusual strength for its weight, involve high powder pressures, great length of gun, exceedingly high muzzle velocity, and a temperature of the powder gases so high that it will necessarily induce rapid erosion. Abnormal powder pressures must be met either by using more material in the gun, or by the use of steel of exceedingly high quality as to strength and toughness, or by some mechanical arrangement in the building up of the gun, which will secure the needed strength with a minimum amount of weight.

Never was it more true than to-day that the battles of the future will be won by the big gun. If the ten or twelve great pieces mounted in their several turrets are unable to fire their eighty or one hundred rounds apiece with accuracy and without diminution of energy, if there be an unusually rapid erosion, if they show longitudinal weakness and begin to droop at the muzzle, or if, as has often happened in the past, the muzzle and chase of the gun are blown bodily away, the ship that carries those guns will go down to a sure and terrible defeat. Unable to reach the enemy because of the failing velocity of her own guns, she will continue to be subject to the pitiless accuracy and armor-piercing energy of the enemy's shells, and the unequal combat can have but one issue.

There are two leading systems of gun construction, the wire-wound system, which is used by Great Britain and Japan, and the solid-steel system, which is used by all of the other leading naval powers, including our own. At the time the wire-wound system was adopted by the British, gun steel for hooped gun construction had not reached the high pitch of excellence which characterizes it to-day, but with improvements in furnace practice and working in the mills, it has become possible to turn out a quality of steel which the German, French, and American manufacturers claim produces a gun equal, weight for weight, to the wire-wound gun—a gun, moreover, which is simpler to build, and in some respects more reliable and less likely to serious injury in an engagement.

In view of the above facts a recent lecture before the Junior Institution of Engineers, London, by Lieut. Dawson, in which he goes very thoroughly into the question of the relative merits of wire-wound and solid steel guns, is of timely interest, since it shows why, in spite of the acknowledged improvements in the manufacture of hooped guns, the English artillerists still prefer to build those of the wire-wound type. The chief advantage of the latter system, according to Lieut. Dawson, is that a uniformity of stress is attainable throughout the whole of the material employed in the gun structure, to an extent that is impossible in a gun built up of steel hoops only. Weight for weight, the wire-wound gun is the most efficient. The uniformity of stress is due to the fact that the wire is wound on at the theoretical tension necessary to obtain from every layer the maximum resistance when the gun is fired. Furthermore, the breaking stress of the wire now used is no less than twice as great as that of the best forged steel available for solid steel construction, the breaking stress of gun steel being from 34 to 44 tons to the inch, as against a stress of 90 to 100 tons for the wire. By regulating the tension in the successive layers of wire during construction, the resisting strength of the steel is obtained to a degree that it is not possible to get by shrinkage. Lastly, because of its small cross section, the wire is more likely to be free from minor defects, since it can be inspected and tested throughout its complete length. So much for the constructional advantages.

In the completed gun there is the advantage that if the inner tube of a wire-wound gun fails, it is still possible to continue firing without danger, whereas, splitting of the inner tube of a built-up gun renders the weapon immediately useless. Should a flaw occur in a tube or hoop, there is great danger of such flaw extending until complete rupture occurs. In a wire-wound gun, on the other hand, a rupture in any coil cannot spread to adjacent coils. Again, should a large explosive shell burst in the bore, the wire construction, according to Lieut. Dawson, will prevent the explosion doing serious damage to the turret. It is possible, when a wire-wound gun becomes badly eroded, to reline the piece and render it nearly as good as new, a feat which is more difficult in solid steel guns. The increase in the power of the gun, due to the introduction of the wire-wound system and to the vast improvement in the quality of gun steel for hooped guns, is shown by the fact that the energy of the British 12-inch gun has risen from 18,200 foot-tons in 1895 to 53,045 foot-tons in the new 50-caliber gun which will be ready in 1910, while the corresponding penetration of wrought iron at the muzzle of the gun has risen in the same period from 24.5 inches to 52 inches, this last being the muzzle penetration of the new 1910 pattern.

BURGLAR-PROOF GLASS.

Consul William Bardel of Rheims reports that a new French plate glass has been brought out which is practically burglar-proof. While an ordinary plate glass such as is usually put into jewelers' show windows, can be smashed by a single stroke of a metal-faced mallet, it is not possible to break this new plate glass in this manner. In an experiment made, a large piece of cast iron was thrown violently against the window, but the only effect on the glass was a small hole measuring one or two inches. Several shots of a revolver loaded with jacketed bullets were then fired at the show window, but the window suffered no damage except that the bullets entered to a depth of a fraction of an inch. The plate glass which will stand such usage is ordinarily made of a thickness of ⅝ to 1 inch. If desired, even a heavier glass can be made without diminishing the transparency.

◆

In order to do away with attending to exhausted batteries of door-bell systems, a transformer has just been put on the market which enables one to obtain the current from the city mains. The transformer will operate on the ordinary lighting circuits. As it has no moving parts, once fixed it will thereafter require no attention. It is adapted to operate on circuits running from 100 to 130 volts, and is provided with taps giving 6, 12, and 18 volts, so as to meet the requirements of various styles and sizes of bells and buzzers.

AERONAUTICS.

Those members of the Aeronautic Society who have completed and tried out their machines have not met with good luck of late. A week before the exhibition of June 26th Wilbur R. Kimball damaged his eight-propeller biplane by hitting the banked part of the track at one of the turns, and last week Frederick Schneider demolished his Wright-type aeroplane, which was fitted with the society's motor when it was shot off the catapult. Both of these members, nothing daunted, intend to build new machines The Beach-Willard monoplane is nearly completed and will probably be tried by Mr Willard within a few days as soon as he has learned how to fly the Society's new biplane.

Senator Henri Deutsch de la Meurthe, who has probably done more than any other one man to encourage the development of aeronautics by offering generous prizes, has recently given $100 000 for the founding of an aero-technical institute in connection with the Paris University The new institute will be named after M Deutsch, and will be devoted to study and research for the purpose of perfecting flying machines of all types. M. Deutsch has also given $3,000 and the University $2,000 annually to carry on the work M Basil Zakaroff a wealthy Greek resident of Paris, has given $140,000 for the founding of a chair of aviation by the Faculty of Science at the University These two gifts show the generosity not only of the native Frenchman but of the foreigner who has made France his adopted land when the two meet in the common field of science.

The "Zeppelin I"—the German government s first Zeppelin airship—recently made the trip from Friedrichshafen to Metz. The former place was left at 12 27 A. M, June 29th There was a light northwest wind blowing Ravensburg was passed at 1 07 the airship continuing northward at about 18 miles an hour At 4 P M a landing was made in a field at Biberach because of bad weather and trouble with the motors Despite a heavy rain, the crew of eight men brought the huge craft safely to earth A battalion of soldiers was required to hold it the next day when the wind blew a gale Repairs were finally effected and the airship at length reached its destination on July 4th After another of the latest type Zeppelins' is completed for Metz the "Zeppelin I' will be sent to Tegel, near Berlin, as a school ship The official report of the recent long-distance trip of the 'Zeppelin II" will be found in the current Supplement

A faint idea was given New Yorkers last week of what a modern dirigible could do in the way of passing over their city, when Frank Goodale sailed his tiny airship from Palisade Park, on the west bank of the Hudson opposite 130th Street, across the river and above Broadway to 42nd Street The craft, under perfect control and making about 12 miles an hour circled around the Times Building and returned to its starting point in 40 minutes. A large modern dirigible, with a speed three times as great and a carrying capacity of a score of passengers, could have made this trip in much less time, even with quite a wind blowing. M Clement, of Paris, is at present constructing just such an airship with the idea of crossing to England Some patriotic British newspapers are constructing a shed for it at Aldershot with the hope that after this craft has demonstrated its capabilities the government will purchase it and thus acquire a large up-to-date dirigible.

Orville Wright, in attempting to fulfill the government requirements at Fort Myer with his aeroplane has met with numerous set backs and a great deal of ill luck Owing to trouble with the motor and unfavorable winds, the first flight consisting of one circuit of the field, was not made until June 29th, and then only at the third attempt The next day the machine flew the length of the field but scraped one end of the lower plane in making the turn, and in landing broke one runner On July 2nd two flights were made of 7 and 12 minutes, the second being terminated by the stopping of the motor when the machine was over the shed at the end of the field In landing one end of the lower plane caught on a small tree, which tore the cloth and whirled the machine around, completely demolishing the runners. Ten days were taken to repair the machine, and it was not until the 12th instant that Orville Wright succeeded in flying again This flight lasted 5 minutes and 38 seconds. The next day the machine failed to rise properly, and but two straight-line jumps of less than half a minute were made, a runner being broken in alighting the second time. Although a large crowd of prominent people visited the parade ground every afternoon last week conditions were generally said to be too unfavorable for a flight, and aviation in the vicinity of the national capital received a sharp set-back as a result of the failure of the Wright machine to fly under what could hardly be called really unfavorable conditions, such as a light wind of 6 or 8 miles an hour for example.

ELECTRICITY.

A large Mexican hydro-electric company has just been organized for the purpose of furnishing the power for a vast irrigation scheme A large plant is to be built near Lake Chapala and another on the Santiago River near Guadalajara The territory which is to be reclaimed by this irrigation system covers more than 500 000 acres.

The success of the electrically illuminated baseball grounds at Cincinnati Ohio has been so pronounced that it is now proposed to have football games, as well, on the illuminated field Football is too strenuous a game to be played under the summer sun but no such objection can be raised to it in the cool of the evening or night. It is expected that quite a number of outdoor sports and games will now be possible for evening entertainment

Last year $56 000 000 was spent by the railroads of the United States for cross ties The average price of the ties was 50 cents each Only six per cent of the ties was used by electric railroads Forty three per cent of the ties were of oak, and nineteen per cent of yellow pine Owing to the growing scarcity of suitable timber other woods are being used after treatment with various preservatives and it has been found that these treated woods outlast the more expensive untreated oak ties.

In a talk given before the Electric Club of Chicago Mr Edward N Lake pointed to the remarkable growth of street railway systems in the United States Of the 8 123 miles of single-track railways in 1890 only 15 5 per cent were operated by electricity At the beginning of last year there were 34 404 miles of street railway, 34 060 miles or 99 per cent of which were electrically operated Mr Lake also pointed to the rapid strides now being made in the electrification of steam railroads and predicted great progress within the next ten years

A new type of electro magnetic brake is being manufactured in Germany which operates on the rails rather than on the car wheels This rail brake comprises a pair of pole shoes which are parallel with the rails and located close to them The braking effect may be increased by lengthening the pole shoes. The weight of the brake is but three per cent of the pressure it exerts The brake is adapted particularly for mountain railroads and may be used in conjunction with an ordinary wheel brake to increase the adhesion of the car to the rails.

Early in June an outdoor theater conducted by the Boston Suburban Electric Railroad at Auburndale-on-the-Charles was burned to the ground The fire was discovered at 2 o'clock in the morning but the general manager was on the scene inside of twenty minutes A telephone station was immediately established, and within two hours a designing engineer was on the ground planning a new structure An hour later the carpenters and contractors arrived ready to estimate the cost of reconstruction By this time the ruins were cool enough to permit of starting work which was rushed through with such celerity that within ten days a brand new theater complete in every detail and seating three thousand persons was ready for use Credit for this rapid construction is due almost entirely to the telephone which was in constant use during the ten days of construction

It is well known that Hertzian waves can be transmitted more readily over water than over land The reason for this was explained quite recently by Prof J A Fleming in a popular lecture He showed that a current of high frequency could be transmitted over a galvanized iron wire as readily as by means of a copper wire but that if the zinc was burned off the wire, so that the current had to traverse an iron path there was a considerable reluctance This showed that high frequency currents which normally travel over the surface skin of a wire, will penetrate farther into the metal of low conductivity The Hertzian waves do not penetrate water to a depth of more than a few feet but when traveling over dry soil there is a much greater penetration due to the poorer conductivity which results in a greater loss of energy

An electric railway running from Trient to Malé, Austria, a distance of 38 miles, is soon to be put into operation The current is to be supplied by a hydro-electric plant. This marks an important step in the utilization of water power in the Tyrol Another railway line is nearing completion in Austria, known as the Maria Zell road This line is 57 miles long and is the longest single-phase railway in Europe The current is furnished by a hydro-electric plant, and is fed to the trolley wire at a pressure of 6,000 volts. The catenary system is used for supporting the trolley wires. The locomotives will each be equipped with two single-phase 250-horse-power motors Owing to the narrow gage, the motors cannot be mounted on the car axles, but are situated above the trucks and connected to the wheels by means of connecting rods after the manner of a locomotive.

SCIENCE.

"Orthodentist" is the technical name of a new kind of dentistry In plain English orthodentist means "tooth-straightener According to last accounts, there are about 60 of him now in America, as compared with 50 000 ordinary dentists To the orthodentist s mind a man who extracts a tooth in regulating foolishly clings to old tradition He holds that the properly shaped jaw can hold all the teeth that grow

Mr C E S. Phillips exhibited at the recent *conversazion* of the Royal Society a permanently luminous watch dial and military night compass The watch dial is transparent (glass) and the figures are painted upon its upper surface The dial is backed with a compound containing a minute quantity of $RaBr_2$ (radium bromide) which renders it luminous so that the time may be easily read in the dark The compass is arranged upon the same principle By means of a luminous disk and strip direction may be determined at night

A series of ascents of kites and balloons on Lake Victoria was organized by the Prussian Aeronautical Observatory of Lindenberg in July 1908 A registering balloon which attained the height of 19 8 kilometers recorded at that altitude a temperature of —84 deg C a lower value than has ever been found at equal or even greater altitudes over Europe The isothermal layer was entered on several occasions On several occasions also an uppermost current from the west was found above the regular easterly current of the equatorial region

It was shown by the N S W Royal Commission on the Spontaneous Combustion of Coal Cargoes (1897) that ships whose cargoes took fire had mostly been loaded in summer In view of the high summer temperature of Newcastle N S W, this was only what might have been expected, but it does not seem to have been noticed that a similar relation might obtain for cargoes loaded in the temperate climate of the United Kingdom Prof Threlfall has made an analysis of 4 898 long voyage shipments in the years 1873 1874 and 1875—presented to the English Royal Commission of 1876—which analysis shows unmistakably that it is only cargoes loaded in summer which are liable to spontaneous combustion

A new process of keeping eggs consists in placing them first in compressed carbon dioxide which almost completely sterilizes them and then in a mixture of carbon dioxide and an inert gas (nitrogen and hydrogen) at a temperature near the freezing point In these conditions the micro-organisms which have not been destroyed cannot develop The addition of the inert gas is necessary in order to prevent the liquefaction of the albumen which would certainly occur in an atmosphere of pure carbon dioxide Eggs thus treated can be kept ten months without losing any of their qualities The treatment costs about 38 cents per thousand eggs while cold storage costs 13 cents per thousand per month hence if the eggs are kept nine or ten months the former process will be much cheaper than the other

A French commission formed for the purpose of making comparative studies of the vertical and inclined styles of handwriting with regard to the health of school children has unanimously reported in favor of the inclined style which is asserted to be far simpler and less fatiguing than the vertical style and less likely to cause spinal curvature and other evil results In writing by the vertical system the right arm is held in an unnatural position which makes it impossible for the child to maintain a normal and hygienic posture Vertical writing is performed very slowly and laboriously and may seriously injure children who are predisposed to spinal curvature and other deformities or to writer s cramp The oculist of the commission denies that vertical writing presents any advantage over inclined writing with respect to the prevention of short sightedness

At a meeting of the horticultural society of Algeria, last November a number of seedless dates of large size and fine flavor were shown which had been produced without artificial fertilization The date palm (*Phœnix*) is a diœcious plant the male and female flowers being borne on separate trees No seed can be formed unless pollen is conveyed from the male to the female flower by wind insects or human agency In Algeria pollination is usually assisted by placing a few male flowers with ripe pollen among the female flowers Egyptian paintings show that this method was practised in antiquity Seedless fruits have often been produced by isolated female trees but hitherto these seedless dates have been imperfectly developed At Nice is cultivated a species of date palm which produces black fruit and bears abundantly every year whether the flowers are fertilized or not the seedless dates being equal in size and flavor to the normal fruit In most species however the seedless dates are smaller and are produced less abundantly than the normal fruit.

SOME EXPERIMENTS WITH AN ORANGE.

BY PROF GUSTAVE MICHAUD, COSTA RICA STATE COLLEGE

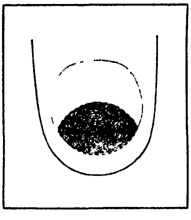
Experimenters in need of chemicals may sometimes do without the druggist The soil, plants, animals, are but chemical laboratories in one orange, chemicals are found in such a number and of such a nature as to enable anyone to perform several curious experiments Most of the readers of the SCIENTIFIC AMERICAN probably have read about or used the sympathetic ink which is obtained by merely dipping a pen into the juice of the fruit The sudden apparition on the heated paper of the hitherto invisible script is one of the pretty experiments which can be made with orange juice Those which the writer is about to describe have more to do with the physiological than with the strictly chemical properties of the fruit

Sugar and a considerable amount of citric acid are found in a ripe orange Besides the taste, a good proof of the presence of a true acid in orange juice can be had by boiling in water a few red cabbage leaves and then letting some orange juice fall into the bluish decoction The instantaneous change from blue to red reveals the presence of acids even when taste fails It may be a matter of surprise to many to learn that the strong sugar and acid flavor of orange juice cannot be perceived by a considerable region of our gustative organ The middle anterior part of our tongue is as insensible to these two flavors as the *punctum cæcum* of our retina is insensible to light The fact was ascertained for the first time I believe by the scientist Schreiber who carefully fixed the boundaries of the insensible regions of the tongue for many substances among which were sugar and citric acid The accompanying drawing shows that the unresponsive area corresponding to sugar does not coincide everywhere with the area of insensibility for citric acid but it shows at the same time the existence of a large territory common to both Cut a small piece of peeled orange Express it slightly so as to avoid the dropping and running of the juice over the tongue Place it in contact with your tongue at nearly one inch from the tip You will find the orange absolutely tasteless Bring forward the same piece of orange on to the tip of the tongue and the strong sugar and acid flavor instantaneously reappears.

It cannot be said that a part only of our gustative organ is insensible to the taste of the essential oil contained in the orange peel for it is the whole tongue and mouth which do *not* perceive it To say this while everyone knows the powerful aromatic taste of orange peel seems foolish enough yet it is true That particular taste is not a taste but a smell perceived with the nose only and many other sensations called tastes have not the slightest right to such a title Yet the statement that such condiments as vanilla or peppermint are tasteless, is sure to arouse considerable opposition if you make it after dinner in a company of laymen Ask the most determined of your contradictors to leave the room for a moment and meanwhile cut into small pieces some of the outer yellow peel of an orange, which you place into a spoon Your opponent is then requested to close hermetically his nose and to enter the room When he is near the table you ask him moreover to close his eyes and to eat and name the spoonful of food you place into his mouth As long as his fingers press his nostrils, no amount of chewing or swallowing will enable him to comply with the latter request

Yet it is not probable that any part of any plant is much richer in essential oil than the yellow epicarp of the orange It is so loaded with the odoriferous liquid that any change in its shape will produce tiny jets which spring in every direction. To observe these light a candle and bring near it a piece of orange peel held between thumb and forefinger Double and press the peel, the yellow side facing the candle, as shown in the photograph Pretty streaks of fire will be seen to start from the candle up to several inches away from it They are produced by the ignited jets of essential oil

Streaks of fire drawn from an orange peel.



Some blind spots of the tongue

Dots define region insensible to taste of sugar dashes, region insensible to citric acid and shaded region that insensible to orange

◆◆◆

To prevent the drying out of gum Arabic it is only necessary to place a small piece of camphor in the solution The gum is not thereby impaired but remains adhesive to the last drop Another method is to add a small addition of glycerine

SOME NEW WARSHIPS AND THEIR EQUIPMENT.

BY PERCIVAL A. HISLAM.

During the past two months a good deal of information has become available concerning the naval construction of various foreign powers, and this it is proposed to summarize in the following brief paper The British Admiralty is still very reticent as to the armament of the "Neptune" (laid down in January) and of the four battleships of the current year's programme but it is generally understood that these five battleships will all be armed with the new 13 5 inch gun with which experiments have been made during the last twelve months. In some quarters it is doubted whether the gun will be in a sufficiently forward state to allow of its being mounted in the 'Neptune,' but its adoption in the four 1909 ships is regarded as certain None of the ballistics of this gun has been allowed to become public but its shell will weigh 1 250 pounds, or 400 pounds heavier than the shell of the 12-inch gun which now forms the main armament of most battleships. Ten of these guns will be mounted, their disposition being shown in the accompanying plan.

LATEST "DREADNOUGHT" DESIGNS OF THE NAVAL POWERS.

Much uncertainty still exists as to the armament of most of the German ships of the "Dreadnought" type, of which ten are now under construction. The British Admiralty last year stated that the first four would carry twelve 11-inch and twelve 6.7-inch. This year an official (British) statement places the main armament at the same figure, but gives twelve 6-inch guns as the secondary armament.

This has recently been confirmed by the German government. Much uncertainty, however, still exists as to the armament of the six later German "Dreadnoughts." Fighting Ships, a usually reliable naval annual, states that they will have twelve 12-inch guns divided between four turrets It should be noted however, that although this plan is stated to have been obtained from an official model, the remark is added that 'it is not impossible that one of the middle turrets may be suppressed, and the ships carry only nine 12-inch or even only eight." Sketch plans of the "Rheinland" and "Posen" (sisters to the "Nassau" and "Westfalen") and of the later ships, are given in the accompanying plan.

It is now certain that the armored cruiser "Blucher" will carry twelve 8 2 inch guns (242-pound shell), and the British Admiralty credits her with a secondary armament of eight 5 9 inch It is impossible to obtain any confirmation of the secondary armament, and those who have seen the vessel say that there is no provision for the mounting of such weapons. Twenty 24-pounders are given as the alternative She will have a six inch belt and a speed of 23 5 knots with triple-expansion engines of 35,000 horse-power The "Von der Tann," the first of the real German 'Dreadnought" cruisers, which will be completed this year, will carry either eight or ten 11 inch guns. The G" and "H" of later programmes, will carry ten guns of this caliber disposed as in the "Dreadnought." Their main belt is 7 inches thick, and their speed with Parsons turbines of 45,000 horse-power, 25 knots.

The new scout-cruisers building for the German navy will be of 3,800 tons and will carry fourteen 4 1 inch guns, the speed being 26 knots.

The Japanese battleships "Aki" and "Satsuma," which were laid down in 1905, will not be completed before 1910 They are the first battleships to be built in Japanese yards, and the experience, although doubtless of great value, will have been dearly bought The "Satsuma' is of 19 350 tons and is armed with four 12 inch twelve 10-inch, and twelve 4 7 inch guns, while the 'Aki" 450 tons larger, will have eight 6-inch instead of the 4 7's. Two new ships have just been laid down the 'Kawachie" at Kure on January 18th and the Settsu" at Yokosuka on April 1st On a displacement of 20 800 tons they will carry twelve 12-inch ten 6-inch and twelve 4 7 inch guns. The 'Jiji Shimpo' a Japanese paper, gives only ten 12-inch, but the heavier armament is fully confirmed Fighting Ships gave these vessels fourteen 12 inch the end turrets containing three guns apiece, but the design, although produced, was abandoned The armored cruiser 'Kasuga' by the way has had her single 10-inch gun replaced by two 8-inch, and now is similar in all respects to the Nisshin" The new 1 150-ton destroyer 'Umikaze," built at Maidsuru has completed her trials successfully easily maintaining the desired speed of 35 knots. Her engines are of 20,500 horse-power (turbines)

No new vessels have been commenced for the French navy since July of last year Italy, however, has ordered two battleships of approximately 20 000 tons, their names being "Dante Alighieri" and "Leonardo da Vinci" They will have turbine engines of 30,000 horse-power and a speed of 22 to 23 knots, while their armament will consist of twelve 12-inch guns mounted in four turrets and disposed as shown in the illustration. The secondary battery comprises eighteen 4,7's. Two other battleships are shortly to be ordered, and while their armament may follow that of the earlier vessels it is also rumored that, in accordance with the proposals of Col Vittorio Cuniberti, the distinguished naval constructor, they may carry eight 14-inch guns of a new type This burst of activity on the part of Italy is due to the fact that the Austrian government has recently embarked on a four-"Dreadnought" programme, the vessels to carry ten 12-inch guns and to steam 23 knots with engines of 30,000 horse-power,

The reconstruction of the Russian navy has at last

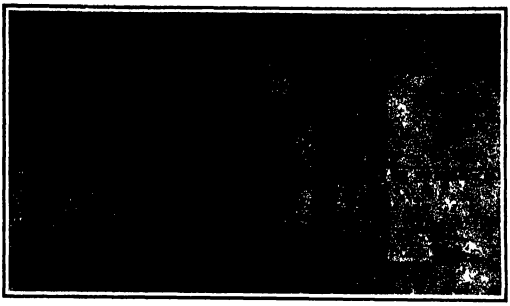
OPENING OF THE DOWN-TOWN HUDSON TUNNELS.

The opening to public traffic of the immense passenger station of the Hudson & Manhattan Railway the terminus of the down town pair of the Hudson Companies' "tubes" under the Hudson Terminal Building, marks a further step in the expansion of this great, inter urban transportation system

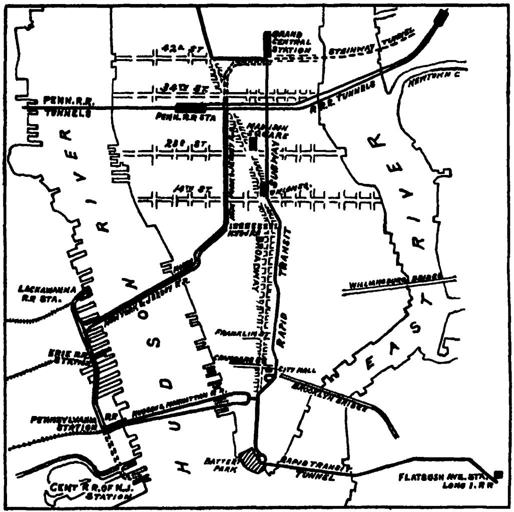
When first a subaqueous connection between New York city and New Jersey was projected by Haskin thirty five years ago his scheme was by many considered visionary but the tributary system of tunnels already completed or immediately projected, not to mention its possible further extensions, all the outgrowth of the original Hudson tunnel would have been beyond his wildest dreams

The first Hudson tunnel was commenced in 1874 and suffered many vicissitudes before its completion passing through the hands of four different operators After being abandoned for eight years excavation was resumed and notable progress made by an English company in 1891 by methods not essentially different from those by which the tunnel was eventually completed and after extending the tunnel to 4,000 feet from the Jersey shaft they abandoned the project only through lack of funds The enterprise of Mr McAdoo supplied the latter and in 1902 the New York & New Jersey Railroad Company took up the work under the direction of Mr C M Jacobs who had done remarkable pioneer work of the same sort in the East River gas tunnel and in March 1905 successfully drove into the New York workings the northern of the pair of tubes into which the original single tunnel had been divided The actual completion of a traversible roadway under the Hudson the long anticipation and many failures of which had made investors skeptical greatly facilitated the financing of an expanded project Alliance was made between the New York and New Jersey Railroad Company and the Hudson & Manhattan Railway which had already projected tunnels from the Pennsylvania station in Jersey City and Cortlandt Street and connecting lines along the Jersey shore and terminal extensions in New York were planned which are best understood by reference to the accompanying map A complete history of the system and description of its methods of excavation fully illustrated was given in our SUPPLEMENT of February 29th 1908

It is the last mentioned pair of tubes from Jersey City to Cortlandt Street that have now been opened to the public, providing as will be seen from the map direct communication from the heart of the financial district to the Pennsylvania, Erie and Lackawanna railroads, while passengers from New Jersey will also be able to step directly into trains of the Interborough subway for uptown Manhattan and the Bronx or Brooklyn



VIEW OF CONCOURSE, LOOKING NORTH ON WEST SIDE



PLAN OF HUDSON COMPANIES' SYSTEM AND CONNECTIONS

When the extension now authorized is completed via stations at Sixth Avenue and 39th Street and Fifth Avenue and 42nd Street to a terminal station between Lexington and Park Avenues further connection will be made there with the Interborough subway Grand Central Station and the Steinway tunnels to Long Island in addition to the connection at 33rd Street with the new Pennsylvania Station and its main line service to the West and South and to Long Island

The newly opened twin tunnels diverge slightly as they leave the Jersey shore entering New York under Cortlandt and Fulton Streets between which is situated the Hudson Terminal Building the largest office building in the world accommodating twenty five thousand persons and carrying in its thirty nine elevators between thirty and forty thousand passengers a day

Inclosed in the eight foot thick solid concrete foundation of this building 75 feet deep 180 feet wide and 4[illegible]0 feet long is the three story station just opened Inclined planes stairways and elevators lead from the street level to the concourse a handsome apartment brilliantly lighted with vaulted roof finished in white glazed tiles relieved with terra cotta containing waiting rooms telegraph and telephone rooms the ticket offices of three New Jersey railroads restaurant barber shop and all the conveniences of a large railway station

Special provision has been made for women in the way of rest and recreation rooms with uniformed maids in attendance and it is suggested that shoppers arriving from the Jersey suburbs may do all their shopping without leaving the building Leading retail stores in all lines have taken space in the concourse and an elaborate system is provided for the ordering of goods from uptown by telephone parcels being received at a special department and kept till called for by home going husbands from down town in the evening

The color scheme of the concourse is white and green all the iron and wood work being of the latter color which is restful and refreshing to the eye The only defect is a somewhat excessive display of advertisements which in order to serve its purpose in catch

(Concluded on page 59.)

TRAIN LEVEL AT HUDSON TERMINAL, LOOKING NORTH ON WEST SIDE

THE THIRD HONORABLE MENTION ESSAY IN THE FOURTH DIMENSION COMPETITION.

BY CHARLES HENRY SMITH (CARE A. RICHMOND, CHICAGO, ILL.)

[It was one of the conditions of the Fourth Dimension Competition that the editor of the SCIENTIFIC AMERICAN reserved the right to publish those essays which were considered worthy of honorable mention. In accordance with that condition the essay which in the opinion of the judges Prof. S. A. Mitchell and H. P. Manning was deemed worthy of third place in the honorable mention class is here printed.—ED.]

A colony of bees housed in a hive with glass walls so that their every movement can be observed affords a very instructive lesson in natural history Such a glass hive may also serve as a helpful illustration in a consideration of the fourth dimension Let us imagine a hive with its floor and roof of horizontal glass plates brought so close together that there is barely room for the bees to move about between them, and for the purpose of our illustration let us endow the bees with the intelligence of men To these bees so confined forward and backward right and left, would be *familiar ideas* and *their* world would be one of two dimensions only Debarred from upward and downward movement by the closeness of the glass plates, the words up and down would be meaningless to them because there would be no experience upon which to base these ideas Imperfect as is the illustration it suggests the conception of a world of only two dimensions length and breadth

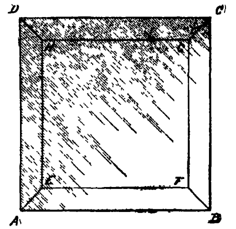
Plane geometry is a science which deals with such figures as triangles squares and circles It is interesting to know that it originated in Egypt where it was developed to facilitate the measurement of land This origin of the science gave rise to the name geometry which means earth measurement Long subsequent to the era of its Egyptian development the science was extended under the name of solid geometry to a study of such figures as spheres cubes and cones

The bees in the glass hive could move around a square could make triangles and circles and to them plane geometry would be a practical science but with their ignorance of an up-and-down direction a cube or sphere would be inconceivable and a third dimension would appear to them as absurd and unthinkable as a fourth dimension does to us Suppose we lay two pencils on the table so as to cross one another at a right angle and then hold a third pencil so as to form right angles with the other two While this is obviously a possible thing for us to do it would be impossible for the bees with their ignorance of the dimension of height They could of course have two slender pencils in their hive at a right angle to one another but they could not have a third pencil at right angles to both of the first two We may look upon the two pencils as representing the two dimensions of the world of the bees and the three pencils as representing the three dimensions of our world Suppose further that some one tells us to hold a fourth pencil at right angles with the other three In our field of experience we can find no place for it just as the bees could find no place in their field of experience for the third pencil This fourth pencil represents the so-called fourth dimension Although it is impossible for us to place it the illustration of the relation of the bees to the third pencil or dimension teaches us that the limitations of experience ought not to be deemed conclusive as to how many dimensions space may have

It is a matter of pure speculation as to whether there is such a thing as a fourth dimension whether there are beings of intelligence to whom phenomena are manifested in the form of four dimensions It is by no means the attitude of mathematicians to instantly recoil from the suggestion but they are pleased to go ahead and study as accurately as possible under the necessary limitations what may be the properties of a space of four dimensions if there is any such thing The fundamental guiding principle of their investigation is this Whatever they find to be the relations of geometry of two dimensions to geometry of three dimensions they assume that there are similar or analogous relations between geometry of three dimensions and geometry of four dimensions As the circle is to the sphere so is the sphere to some unknown body which may have its existence in space of four dimensions As the square is to the cube so is the cube to a figure in space of four dimensions which we may call the cuboid

Of course the fourth dimension is intangible Mathematicians do not ask us to imagine a fourth dimension much less do they ask us to believe in it It is not to be supposed that the most skilled student in this subject has a mental picture of four-dimensional space Nevertheless the properties and relations of figures existing in four-dimensional space may be investigated and stated

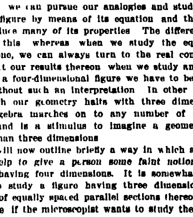
Algebra is the science of numbers. It is a very efficient aid in the study of geometry Algebra deals largely with equations such as $xy = 12$, which means that x and y are two variable numbers that multiplied together give 12 as for example 3 and 4 or 5 and 2 2/5 All the simpler figures of geometry such as the straight line and the circle may be represented by equations, in other words, the equations are condensed descriptions of the respective geometrical figures somewhat as a score-card is a condensed description of a base-ball game. Mathematicians have learned that the properties of geometrical figures can be studied far more readily by means of their equations than by means of the figures themselves. A mathematician who understands this mode of study can look at the equation of a curve and tell all sorts of interesting and useful properties of it without ever seeing the curve itself—indeed, without even having any mental picture of what the form of the curve may be



Top view of a glass cube as seen with one eye: a three-dimensional figure appearing in one plane.

Without going into detail, it may be stated that one equation with two variable numbers represents a plane figure thus $x^2 + y^2 = 15$ represents a circle. One equation with three variable numbers represents a figure in space thus $x^2 + y^2 - z^2 = 0$ represents a cone What does one equation with four variable numbers represent say for example, $x^2 + y^2 + z^2 + w^2 = 20$? By analogy we should say a figure in space of four dimensions. Although we cannot imagine such a thing we can pursue our analogies and study this unreal figure by means of its equation and thus we can deduce many of its properties The difference is simply this whereas when we study the equation of a cone, we can always turn to the real cone and interpret our results thereon when we study an equation of a four-dimensional figure we have to be satisfied without such an interpretation In other words, although our geometry halts with three dimensions our algebra marches on to any number of dimensions and is a stimulus to imagine a geometry of more than three dimensions

We will now outline briefly a way in which algebra *may help to give a person some faint notion of a* figure having four dimensions. It is somewhat common to study a figure having three dimensions by means of equally spaced parallel sections thereof For example if the microscopist wants to study the shape and structure of a germ cell he slices off exceedingly thin sections and arranges them in succession on a glass slide Then by looking at these sections in succession he can form an idea of the solid structure of the germ cell Mathematicians have rules by which such sections of a solid figure may be constructed by means of equations. They start with an equation which represents a solid body, for example, $x^2 + y^2 + z^2 = 9$ representing a sphere, and they perform certain operations by which they get a series of resulting equations that represent the successive sections of the solid body It remains, then, merely to draw pictures of the sections from the data afforded by the resulting equations. By looking at all these pictures, a person may get a fair idea of the shape of the original solid. In the case of a sphere the sections are circles of varying size. As we have already stated, an equation having four variable numbers, should by analogy represent a figure in space of four dimensions. Suppose we have such an equation, as $x^2 + y^2 + z^2 + w^2 = 20$ We can apply the same rules and perform the same operations to get sections of the figure represented by this equation. Curiously but consistently, these sections come out as solid figures. From the data afforded by the resulting equations, the mathematician can model these solid figures in clay and lay them in a row on the table before him Just as the microscopist looks at the series of sections on his slide to get an idea of the solid structure of the germ cell, so the mathematician can look at the series of clay models before him and possibly feel that he has some idea of the nature of the four-dimensional figure represented by the equation with which he started



Analogous view of a "cuboid" of four dimensions appearing as a figure of three dimensions.

Thus we see how the fourth dimension may be studied by means of the equations which algebra furnishes. There is another bolder way We have seen that we can hold three pencils so that each one of them will make a right angle with each of the others. Instead of saying that it is absurd to suppose that a fourth pencil can be held in a position so as to form right angles with each of the first three pencils, let us *assume* that it *can* be done Without any further assumptions a complete geometry of four dimensions can be built up by pure reasoning. *Many of its* conclusions are no more obvious to the senses than is the fundamental assumption with which it starts. Still that is the *only* assumption, all else may be deduced from that one assumption and from the principles of our well known plane and solid geometry

An illustration of a special method in the study of space of four dimensions may serve to show how mathematicians reason about such things without being able actually to imagine them We proceed by ascertaining the relations between two dimensions and three dimensions, and then establishing these relations by analogy between three dimensions and four dimensions Suppose we have a glass cube resting on the table before us and we close one eye and look straight down upon it with the open eye Its appearance will be as shown in the accompanying drawing. This drawing is really a plane figure, of two dimensions, and it might have been produced in the following manner, namely by drawing one square inside of another and then drawing lines connecting the corresponding corners. All this could be done without any thought of three dimensions. The bees in the glass hive could draw such a figure as the one here on the paper before us. Nevertheless, on this figure many of the properties of the cube can be studied By counting the four-sided figures (*ABCD EFGH ABFE, BFGC CGHD, DHEA*) which we find to be six, we learn how many faces the cube has. By counting the corner points, which are eight, we learn how many corners the cube has. By counting the lines, which are twelve, we learn how many edges the cube has. Just as starting with the squares we are able to get a two dimensional figure which, for the purposes of investigation, may be taken as representing the cube, may it not be possible that starting with cubes we can get a three-dimensional figure which shall represent the four-dimensional figure which we call the cuboid? Just as we drew a smaller square inside of a larger one, so we should think of a smaller cube inside of a larger cube, and just as we drew lines joining the corresponding corners in the case of the squares, so we should make planes joining corresponding edges in the case of the cubes. The figure so formed is somewhat imperfectly pictured in the accompanying drawing, and for the sake of clearness, let us suppose we have such a solid glass figure before us. In the case of the squares to find from them how many square faces the cube has, we counted the big outer square, the small inner square and the four surrounding figures and got six as the result So in the case of the cubes, to find from them how many cube faces the cuboid has, we count the big outer cube, the small inner cube and the six surrounding solid bodies and thus get eight as the result, this indicates that the cuboid has eight cube faces. A further study of this representative figure discovers that the cuboid has 24 plane square faces, 32 edges and 16 corner points. This shows how we can get a representation of a four-dimensional body and on this representation we can study its properties. There are many considerations which we have not space to present which confirm the accuracy of the deductions that have just been stated.

What is the use of such generalities, abstractions and speculations? About the same as to know whether the earth goes around the sun or the sun goes around the earth. Space is as properly an object of scientific study as are planets or geological strata Moreover, the study of these fundamental things in geometry throws light on the nature of our own mental equipment. We learn better what is the nature of reasoning processes and how knowledge is built up from simpler and more fundamental elements. Such speculations sometimes lead to very useful results.

If you hold 5 marbles in your hand and are told to take away 8 of them, this suggestion seems as unthinkable as the suggestion of a fourth dimension. But when men chose to represent by —3 the result of subtracting 8 from 5, instead of simply saying it was impossible, then the foundation was laid for the enormously useful science of Algebra.

The assumption of a fourth dimension has not as yet led to any noteworthy useful results, but it is by no means impossible that the science of four-dimensional geometry may come to have useful applications It has been suggested by Prof Karl Pearson that an atom may be a place where ether is flowing into our space from a space of four dimensions. It can be shown mathematically that this would explain many of the phenomena of matter At the present stage the suggestion is regarded, even by its author, as merely fanciful, though it is not as fanciful as the proposition of the German spiritualists who regard the fourth dimension as the abode of their disembodied spirits.

SOME NEW WARSHIPS AND THEIR EQUIPMENT

(Concluded from page 56)

been entered upon seriously, and four battleships were laid down simultaneously in Baltic yards on June 16th The "Sevastopol" and "Petropavlovsk" are building at the Baltic works and the "Poltava" and "Gangut" at the new Admiralty yard, the English firm of John Brown & Co being in charge of the work On a displacement of 23 000 tons they will carry twelve 12-inch guns, arranged as shown, as well as sixteen 4 7's and four torpedo tubes The speed will be 24 knots and the horse-power 42,000, which is very high for battleships. Meanwhile four other battleships which were laid down in 1903—the "Imperator Pavel" and the "Andrei Pervozvanni" in the Baltic and the "Ioann Zlatoust" and "Evstafi" in the Black Sea—are still incomplete

It is only four years since the first all-big-gun ship was laid down, but the following table will show how completely the idea has seized upon the naval powers It shows the number of battleships of this type completed, under construction, or to be laid down this year

TABLE SHOWING TOTAL GUN POWER OF "DREADNOUGHTS"

	Great Britain.	Germany	United States.	Austria.	Italy	Russia.	Brazil.	Spain.	China.	Japan.	Chili.	Argentine.
Eight 14-in.					2 or 0							
Ten 13.5-in.	4 or 5											
Twelve 12-in	0	6 ?	2		2 or 4	4	3	0		2		
Twelve 11-in		7 or 6										
Ten 12-in.	8 or 7		4	4							2 ?	2
Ten 11-in		0 or 1										
Eight 12-in.	4		2					3	3 ?			
Tot l in ships of this type	188	156 or 154	80	40	48 or 44	48	36	24	24	24	20	20

We also present a table which analyzes these vessels according to their main armament. It will be seen that, but for her four ships of this year's programme, British designs would "put up a poor show"

	Battleships.	Cruisers.
Great Britain	12*	4
Germany	10	3
United States	8	0
Austria	4	0
Italy	4	0
Russia	4	0
Brazil	3	0
Spain	3†	0
China	3‡ (projected)	0
Japan	2	0
Chili	2 (projected)	0
Argentine	2	0
	57	7

* Besides four "provisional" ships. † Eight 12-inch. ‡ 15,000 tons. Query "Dreadnought" type.

OPENING OF THE DOWN-TOWN HUDSON TUNNELS

(Concluded from page 57)

ing the eye, must afford a contrast generally garish and out of harmony with the otherwise excellent and subdued decoration.

This is doubtless a considerable source of income, difficult to forego in these commercial days, but considering the dignity and lack of ostentation with which the Hudson Companies have carried out both delicate negotiations and difficult engineering feats, considering also the immense profits likely to accrue from their undertakings, one might have hoped that they would omit this rather cheapening feature.

Stairways lead down from the concourse to the five platforms below, at each of which in rotation, separated by only 1½ minutes during "rush" hours, trains arrive by the southern and depart by the northern tube, there being no switching, and everything tending to the most rapid handling of traffic. Each train discharges its passengers upon the platform on one side of it and receives its new load from the platform at the other side an arrangement which entirely separates incoming from outgoing passengers

Again, below the rail level are extensive baggage and store rooms and a subsidiary power station making the Hudson Terminal Building a veritable city in itself, with clubs at the top multitudinous business offices in between, a post office telegraph office and numerous shops below, and a railway station and power station in the basement, all inclosed within four walls.

THE SCIENTIFIC WORK OF THE LATE PROF SIMON NEWCOMB

Prof Simon Newcomb died on July 11th in Washington at the age of 74 His death has removed not only the most distinguished astronomer that America ever produced, but a man who is honored the world over for his monumental scientific achievements.

All Newcomb's work followed up with rare perseverance has constantly tended to this ideal end First, to arrive at a more exact knowledge of the magnitudes serving as points of reference and then to establish the theory not only of all the planets but also of their satellites on a system of constants as precise as modern observations permit

Shortly after he graduated from the Lawrence Scientific School at Cambridge, he began the first important problem with which his name is associated, namely, the motions and orbits of the asteroids which revolve about the sun between Mars and Jupiter It was once thought that perhaps these numerous bodies might be fragments of a large planet which had been shattered by explosion or collision. Were this true, the orbits would pass through the point at which the explosion occurred As more and more asteroids were discovered the coincidences of orbits became less marked Still the theory was adhered to because it was thought possible that the attraction of the larger planets might have caused perturbations. In order to decide for or against the theory, it was necessary to discover general formulæ by which the positions of the orbits could be determined at any time in the past, so that it could be ascertained whether or not the orbits ever did pass through a common point of explosion, in which case it would be possible to give an approximate date for the catastrophe As a result of Newcomb's painstaking investigation he concluded that the orbits had never passed through any point of common intersection Later investigations based on Newcomb's work have shown that the hypothetical cataclysm never occurred and that the asteroids probably always existed as minor planets. The paper which Newcomb read on the subject at the Springfield meeting of the American Association for the Advancement of Science in 1859 was the first that brought him into prominence—a young man of but twenty four

When Newcomb commenced his work at the Naval Observatory in 1861, the problems of the moon's motion had attracted astronomical attention The most perfect lunar tables at the time were those of Hansen Hansen had only a single assistant and could not therefore make the great number of observations required in the case of a body moving so rapidly as the moon For a year or two Newcomb's observations showed that the moon seemed to be falling a little behind her predicted motion This soon ceased however, and she gradually forged ahead in a most remarkable way In five or six years it was apparent that this acceleration was becoming permanent. Astronomers were puzzled to account for the phenomenon For half a century the moon had apparently been running ahead and had then relaxed her speed so far as to fall behind again Hansen had suggested that the planet Venus might be responsible for these inequalities He showed that for 130 years the moon would thus be made to run ahead and for 130 years to fall behind For 100 years the moon seemed to have followed Hansen's theory Yet Newcomb found that the moon was deviating To ascertain whether or not Hansen's tables represented the motion of the moon perfectly since 1750, as astronomers supposed, Newcomb undertook an examination of the occultations of the moon with bright stars It was not until the telescope had been introduced and used for finding the altitude of a heavenly body and not until the pendulum had been invented by Huyghens that the time of an occultation could be fixed with the required exactness—a task first systematically performed by French astronomers of the eighteenth century Newcomb suspected that some accurate observations had been made before their time, which he might use in checking up Hansen's tables He found that a few such observations had actually been made between 1660 and 1700 and discovered to his surprise that Hansen's tables were evidently much in error But to determine the cause of the errors was impossible without more observations. Newcomb planned a thorough search of the old records of Europe On the occasion of the solar eclipse of 1870 he was sent abroad to observe the phenomenon for the Naval Observatory He seized the opportunity to go to Paris and consult the old records of the observatory there After a search he found that the very observations he wanted had been made in great number by the Paris astronomers both at the observatory and at other points in the city Three or four years were spent in making calculations on the basis of these Parisian researches when it was found that seventy-five years were added in a single step to the period during which the history of the moon's motions could be written Before Newcomb's work this history was supposed to commence with the observations of Bradley at Greenwich about 1750 Now it was extended back to 1665 and with a less degree of accuracy farther still Hansen's tables were found to deviate from the truth in 1675 and subsequent years to a surprising extent But the cause of the deviation is not entirely unfolded even now

In 1877 Newcomb took charge of the Naval Almanac Office He thoroughly reorganized the office and placed it upon a more scientific footing He mapped out a programme of work which involved a discussion of all the observations of value on the positions of the sun, moon and planets and incidentally on the bright fixed stars, made at the leading observatories of the world since 1750—a programme which involved a repetition in the space of ten or fifteen years of an important part of the world's work in astronomy for more than a century past It was impossible to carry out this plan in all its completeness so that Newcomb was obliged to confine himself to a correction of the reductions already made and published For all that, the task was one which, in magnitude probably exceeded any ever before attempted by any astronomer The number of meridians observed on the sun Mercury Venus and Mars alone numbered 62 030 Still other branches of the Nautical Almanac Office work involved the computation of formulæ for the perturbation of the various planets by one another

Important among the troublesome problems with which Newcomb had to deal while in charge of the Nautical Almanac was that of universal time There was a day when every railroad had its own meridians by the time of which its trains were run which had to be changed here and there in the case of the great trunk lines and which seldom agreed with the local time of a place The passenger was constantly liable to miss a train, a connection or an engagement by the doubt and confusion thus arising All this was remedied in 1883 by the adoption of our present system of standard times of four different meridians the introduction of which was one of the great reforms of our generation with which Newcomb's name is associated When the change was made Newcomb was in favor of using Washington time as a standard instead of Greenwich But those who were pressing the measure thought it advisable to have a system for the whole world, and for this purpose the meridian of Greenwich was the natural one

By 1894 Newcomb had succeeded in bringing so much of his work as pertained to the reduction of the observations and determination of the elements of the planets to a conclusion So far as the general planets were concerned, it remained only to construct the necessary tables which however, involved several years work Before Newcomb's time the confusion which pervaded the whole system of exact astronomy arising from the disclosures of the fundamental data employed by the astronomers of the various countries and various institutions in their work was such that it was rather exceptional to base any astronomical result on entirely homogeneous and consistent data. To remedy this state of things and to start the exact astronomy of the twentieth century on one basis for the whole world was one of the plans which Newcomb had mapped out for himself when he took charge of the Nautical Almanac Office Dr N W Downing superintendent of the British Nautical Almanac was animated by the same motive He had especially in view the avoidance of duplicate work which arose from the same computations being made in different countries for the same result The field of astronomy is so vast and the quantity of work required to be done so far beyond the power of any one nation that a combination to avoid all such waste was extremely desirable When Newcomb published his preliminary results in 1895 Downing took the initiative in putting the idea into effect by proposing an international conference of the directors of the four leading ephemerides to agree upon a uniform system of data for all computations pertaining to the fixed stars This conference was held in Paris in May 1896

In 1902 when the Carnegie Institution was organized it made a grant to supply Newcomb with computing assistants and other facilities necessary for the completion of his study of the moon's motions

THE DISINFECTION OF SCHOOL BOOKS.

BY JACQUES BOYER.

Although our age prides itself on obeying all the laws of hygiene many of the administrative regulations which are actually in force directly violate these laws. In the primary schools of France the books pass annually from one pupil to another without any attempt being made to prevent the propagation of contagious diseases in this way. Now, despite the good wishes and efforts of the teachers the personal cleanliness of the pupil is not always above suspicion. The children often come to school with soiled garments dirty faces and greasy hands. Even if the morning ablutions have not been entirely neglected the little ones may carry with them the germs of tuberculosis scarlet fever, whooping cough smallpox, or other diseases. The teachers' injunction not to wet the fingers in turning the leaves of books is universally disregarded.

At Montreuil near Paris a method of disinfecting school books which should almost entirely prevent the dissemination of disease has recently been introduced but before we describe this system let us cite a few typical instances of the propagation of diseases by books and papers.

The following case was reported to the Academy of Medicine by Dr Josias. A lady residing with her daughter in a Breton village which was entirely free from scarlet fever received a letter from the child's governess who was then traveling in Germany. The governess wrote that she had had an attack of scarlet fever but was now convalescent and had just entered the period of desquamation. A few days later the mother and daughter contracted scarlet fever. The mother died and the daughter barely escaped with her life.

Brouardel records the propagation of an epidemic of tuberculosis among the clerks of the archives of Kharkof (Russia). One of the clerks who was in the second stage of tuberculosis was in the habit of wetting his finger in his mouth in turning over the pages of the registers which he had to consult. French army surgeons have found disease germs in the records of numerous hospitals and Dr Knop of New York in his work on the Tuberculous Infection of Books, cites the case of twenty clerks of the health department of Lansing Mich who became victims of tuberculosis as a result of handling books infected by one of their colleagues. It has been shown by numerous experiments that cultures of microbes spread on paper show a resistance which varies greatly with the species of microbes. The cholera vibrio becomes inert in 48 hours the germ of diphtheria in 28 days, the bacillus of Eberth in 40 days, and Koch's bacillus in 180 days.

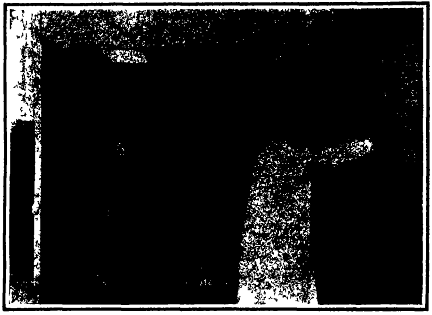

Fig. 4.—Agitating the felt saturated with formic aldehyde.

Various methods of disinfecting books have been invented. The most effective method would be the total destruction of the books but this is too radical to be employed except in rare emergencies. In some English and Scotch cities the public libraries receive daily, from the health bureaus the names and addresses of all cases of infectious disease. If it is found that any books have circulated in infected houses these books are disinfected or in some cases destroyed. This system is used in Bradford and Birkenhead. In London where the density of population would greatly complicate the problem no books are loaned.

In France, Dr Lop proposed, several years ago to disinfect the books of the primary schools every summer also to disinfect the books notebooks and clothes of every pupil attacked by a contagious disease. But how can a book be disinfected without damaging it? Kraus recommends exposure to high pressure steam for 40 minutes. The condition of the binding and the pages after such treatment may be left to the reader's imagination. The original process of Berlioz and Championnière does not seem much better. This process consists in subjecting the objects to the vapor of formic and ethylic aldehydes in an oven heated to about 200 deg. F. This treatment, continued for two hours, completely destroys the most virulent germs (tuberculosis, diphtheria, coli bacillus, etc.) placed on the edges or even in the center of the volumes. For example, a large volume of 1,300 pages was selected for experiment. One of the middle pages was saturated with pus, and another was soiled with fecal matter. A portion of each of these pages was torn off for use as a control. The volume was then placed in the disinfecting oven, and heated for two hours and fifteen minutes to about 180 deg. F. Experiments in producing cultures with the soiled parts gave entirely negative results. Unfortunately, the treatment slightly injured both paper and binding. Marsoulan has recently improved this method by the invention of the simple apparatus which is now in use at Montreuil in the workshops where diseased persons and cripples are employed. In the improved process the books first go through the beater. This machine is a long box connected at one end to an ordinary stove, and provided at the other end with a door through which open racks containing the books are introduced. Inside the box wooden rods are caused to rise and fall, alternately, by cams placed on a cylinder which is turned by a crank. A ventilating fan and a sliding drawer complete this apparatus, which is mounted on trestles. When the crank is turned, the rods strike the covers of the books and dislodge the dust. The heavy dust falls into the drawer upon a mass of sawdust, saturated with a powerful disinfectant while the lighter dust carried off by the air current is consumed in the stove. After this treatment the books are suspended singly by pincers from a series of open metal racks, the covers of the book being bent back. Thus the pages are freely separated, and give easy access to the antiseptic vapor. These racks are mounted on rails on which they are run into the disinfecting oven. Each of the three ovens employed at Montreuil accommodates two racks of books. The ovens are sheet iron boxes, hermetically closed. Two sides of the box can be raised by cranks to admit the book racks. In the center of the oven is a vessel filled with a solution of formic aldehyde, into which

Fig. 2.—The disinfecting ovens.

Fig. 1.—Sliding the rack of books into the disinfecting oven.

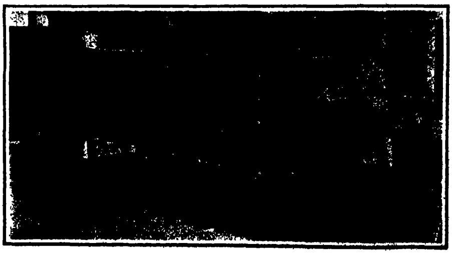

Fig. 3.—The beating machine, which frees the books from dust.

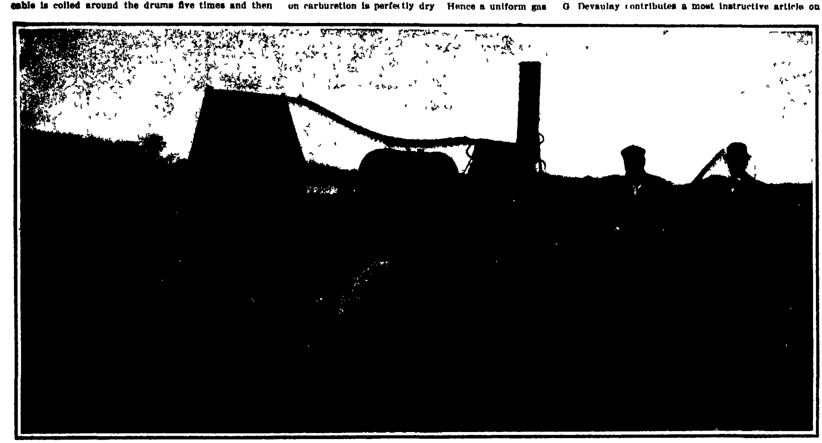
THE DISINFECTION OF SCHOOL BOOKS.

dips a strip of felt, which can be moved up and down from the outside of the oven. The ovens are heated, by steam pipes placed below them, to 122 deg. F The irritating vapor of formic aldehyde makes its escape through a pipe at the top of each oven The operation of disinfection is simple The vessel is filled with formic aldehyde, and the racks laden with books are pushed into the ovens, which are then closed and heated to the required temperature for a few hours After the heating is stopped, the volumes are allowed to remain in the ovens until the next day, when they are found to be entirely aseptic. This improved process of disinfection does not injure either paper or cardboard It is very efficacious as has been proved by the experiments of Dr Miquel, and it is also very cheap, costing only about one-half cent per volume The Municipal Council will shortly be asked to establish new disinfecting plants at various points around Paris, in order to extend the system to all the school libraries of the Department of the Seine Several foreign cities are about to follow this example

AN AMERICAN FARMOBILE

BY FRANK C. PERKINS.

The accompanying illustration shows an American gasoline plow tractor in service The machine is operated with a cable but the plow is not drawn along wholly by traction Two cable drums are provided, each having five grooves to fit the cable The cable is coiled around the drums five times and then projects from the side of the machine. The harder the pull on the machine the tighter the grip of the cable on the drums. Still, there is no friction because the cable fits the groove, and because the traction wheels and the cable are geared together, so that all the tractive effort and the balance of the load fall on the cable



AN AMERICAN FARMOBILE

When a soft spot is encountered or sand interferes the wheels will slip a little, and the cable will take up the load. In other words, the traction wheel is geared about 10 per cent faster than the cable drums, thus causing the traction wheels always to slip a little on the ground on a hard pull In a field demonstration the cable clutch was thrown out and the machine started, but it could not move from its own tracks. It stood and dug a hole 15 or 18 inches deep The cable was then thrown in by the clutch and the tractor moved on The machine is capable of pulling ten plows at a weight of about 8,500 pounds.

When the tractor is run to the end of the field the cable is uncoupled at the front of the machine and the rear The machine and plows are then turned around, and the front end of the machine is coupled to the cable.

In using the machine it is necessary to stake off a strip of land about 200 to 300 feet wide and to string a cross cable at both ends of the field with a single snatch block running upon it.

It is stated that in some instances as much as a mile of cable is used. By shifting the large bevel gear the pinion is disengaged, so that the machine may be used for threshing or general farm work

The tractor has three speeds, 1½, 2½, and 3½ miles per hour The 3½-mile speed is for traction on the road or the hauling of wagons or machinery across the farm.

A New Kind of Illuminating Gas.

What is known as the De Laitte system of lighting houses with gas has attracted not a little attention in Europe Private electric light coal or kerosene gas plants, because of their very large initial cost cannot always be installed Since gasoline has come into fairly common use and is obtainable almost every where a French inventor M Benoit de Laitte, has devised a method of generating gas from gasoline When gasoline vapor is passed into pipes having a temperature lower than that at which the evaporation is accomplished some of the gasoline will recondense into liquid form Because the supply piping is under ground and exposed to low temperature in winter not a little trouble is thus caused De Laitte has devised a carbureter which is intended completely to vaporize gasoline in very cold weather without the application of heat In it the temperature of evaporation falls as low as —17 deg Fahr which is far below the lowest winter temperature in most civilized countries For this reason condensation is practically impossible

It has been found that air will absorb variable proportions of gasoline depending upon the humidity of the atmosphere To overcome this objection De Laitte extracts all the moisture from the air, which is carefully kept from contact with water and thus the air on carburetion is perfectly dry Hence a uniform gas is produced without the possibility of variation

The principle of the De Laitte process consists in the fact that a measured quantity of gasoline is converted into vapor by a measured quantity of air passed in a brisk current over a large surface of gasoline The particular part of the apparatus in which this is accomplished is the carbureter The current of air is produced by means of a drum which induces a certain fixed quantity of air for each revolution and this movement is obtained by a gear in such a manner that for every cubic foot of air taken up a fixed amount of gasoline is induced into the carbureter By this means a gas of unvarying quality is obtained and perfect evaporation effected

The carburetion takes place in a flat metal tube of considerable width and small depth The gasoline flows downward covering a large surface over which the rapid current of air is conducted The evaporation thus caused is so vigorous, that absolutely no residue is left when good gasoline is employed even at a temperature many degrees below the freezing point The proper gas is collected in a small gasometer which serves to regulate the pressure and which acts on the driving power of the drum in such a way that when no gas is required the apparatus is stopped

The motive power necessary to drive the apparatus is exceedingly small—a weight water power, electricity hot air, or a gas motor being employed The gas is burned with incandescent mantles but in consequence of the exceedingly high temperature and combustion, the illuminating power is considerably increased

Between thirty and forty towns are lighted on this plan in Europe In England there are about six thousand installations, which include hundreds of public buildings, railway stations, etc. About twenty or thirty plants are installed in India.

The Current Supplement.

The current SUPPLEMENT No 1751 opens with an interesting article by the English correspondent of the SCIENTIFIC AMERICAN on a new type of transporter for handling meat at Buenos Aires The length of life of a motor boat and engine is so dependent upon proper care, that it will pay every owner of such a craft to understand thoroughly the vital points to be remembered and to see to it personally that the boat and power plant are kept in good condition Mr Harold Whiting Slauson gives the necessary information in an article entitled The Care and Operation of a Small Motor Boat ' An automatic device for securing the profile of the ground such as is needed for railroad work is described by the Paris correspondent of the SCIENTIFIC AMERICAN A graphic comparison of steam and gas engines as power producers is presented James Ferguson s famous mechanical paradox is described—a device which consisted of three geared wheels that performed rather remarkable revolutions because the number of teeth in the three wheels were not the same T C Bridges writes on Martyrs to Science The future of the earth is discussed in an article by Abbé Moreux in which he points out that our earth may be changing its shape S Leonard Bastin writes interestingly on the mimicry of plants G Devaulay contributes a most instructive article on the precision of astronomical observation An apparatus for electrolytic refining of precious metals is described by H La Croix Dr Max Dieckmann presents a partial solution of the problem of electrical vision at a distance We have had occasion recently to mention in these columns a new musical instrument called the choralcelo which depended upon electrically vibrated musical springs for the production of musical sounds The particular apparatus employed is described in the current SUPPLEMENT

The wheels of automobiles are usually inclined to the vertical because the spindles on which they turn are slightly inclined to the rest of the axle This practice of inclining the spindle originated in horse-drawn vehicles, in which the wheels are dished that is to say the spokes are arranged not in a plane but in a conical surface with the apex inward for the purpose of giving greater resistance to lateral shocks With the dished wheel the inclination of the spindles is necessary for the wheels of horse-drawn vehicles are high and their spokes long and it is desirable that the spoke which for the moment is supporting the weight should be in a vertical position

It may be doubted whether this argument applies to the small compact, and stout wheels of automobiles The constructors of the first automobiles regretted that the chains apparently made it impossible to incline the driving wheels It was subsequently discovered that the chains did not form an obstacle and hence the wheels are now inclined It is questionable however whether this construction does not have the effect of giving the wheel a tendency to run in a circle and of increasing the friction against the ground

THE FLIGHT OF THE CURTISS AEROPLANE FOR THE SCIENTIFIC AMERICAN TROPHY

After repeating at dusk on July 5th his performance first accomplished on the 26th ultimo of circling two-thirds of the way around Morris Park race track Glenn H Curtiss took the Aeronautic Society's new biplane to Mineola L I, in order to practise with it upon a wide open expanse and if possible set up some records At dusk on July 13th he made three flights—two short ones of 200 to 300 yards and one long one of 1½ miles and nearly 3 minutes duration In the latter the aeroplane disappeared from view and weirdly reappeared from out the fast gathering darkness The following morning an excellent 5-minute flight was accomplished and 24 hours later this performance was almost repeated when a piston cracked in the motor and the flight was necessarily terminated This flight was made in a dense fog between 6 and 7 A M

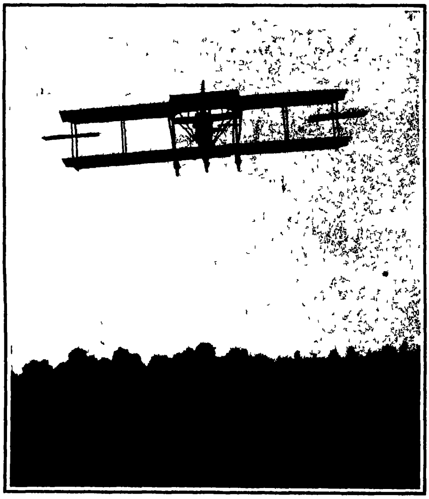
After new and stronger pistons had been fitted Mr Curtiss made two more excellent flights early last Friday morning The first of these started at 5 30 A M and lasted 7 minutes and 20 seconds while the second one which was made at about 7 20 A M lasted 20 minutes and 40 seconds and consisted of some twelve circuits of an oval course of from a mile to a mile and a half in length The height varied from 5 or 6 to 30 or 40 feet There was a light wind of 6 or 8 miles an hour and when the machine flew against it it rose while when it turned to go with the wind it dropped considerably During this flight the aviator described two figure eights with great ease

After the above preliminary practice, Mr Curtiss decided that he would attempt to set up a record for the Scientific American Trophy early last Saturday morning Mr Charles M Manly of the Contest Committee of the Aero Club of America was present and timed the flights As the weather was clear and the air calm the aeroplane was brought out of its tent about 5 00 A M shortly after sunrise A triangular course measuring 1⅓ miles had been staked out on the vast plain near the village Mr Curtiss decided that he would make one circuit of this course in a second attempt to win the President's prize of the Aero Club of America. These four prizes of $250 each were offered by Mr C F Bishop for the first four machines to fly one kilometer Mr Curtiss covered the required distance in his flight at Morris Park on June 26th, but as this flight was made just after sunset he decided to make another about which there could be no question The rules state that all flights for prizes must take place between sunrise and sunset

About 5 15 A M Mr Curtiss climbed upon the aviator's seat of his small biplane and his assistant started the motor by turning the propeller The machine moved forward quickly as soon as it was released and after traversing about 200 feet of the rough marsh land it rose gracefully and flew straight for the first turn This was taken without any difficulty the machine inclining but slightly inward It then traveled eastward beside a row of trees and was brought about in a wide sweep at the apex of the triangle As it approached the spectators on the last leg of the course it seemed to be traveling very slowly yet that this was not so was shown by the time of the circuit which was 2 minutes and 40 seconds corresponding to an average speed of 31.2 miles an hour After alighting Mr Curtiss stated that he had throttled down his motor so as to fly as slowly as possible

The flight for the Scientific American Trophy was started at 5 23 16 A M The minimum required distance 25 kilometers or 15½ miles—made necessary 12 circuits of the triangular course These were completed successfully in about 33½ minutes but the machine continued flying for seven more rounds It finally alighted at 6 15 46 just 52½ minutes after it crossed the starting line Mr Curtiss would have continued longer had it not been for a rather brisk wind which sprang up while he was making the last three or four rounds. This made the machine more difficult to balance when flying across the wind Nevertheless Mr Curtiss seemed to have no great difficulty in managing it and he could doubtless have continued a quarter of an hour longer if he had had sufficient fuel in the tank The average speed of the machine was about 28¼ miles an hour, if figured upon the actual distance between the stakes of the course, but as the machine did not fly very close to the stakes in making the turns, it is probable that this average speed was considerably over 30 miles an hour The actual measured distance flown was 24 7 miles, while in reality the machine probably covered 30 miles in the 52½ minutes it was in flight

The impression received by the several hundred spectators who witnessed the flight was the slow speed at which the machine seemed to travel and the perfect ease with which it moved forward through the air At times it was sent to a height of 40 or 50 feet, and then again it would drop to within 5 or 6 feet of the ground These ascents and descents were always gradual and were generally the result of the aviator's guiding In making a turn however the machine invariably loses speed and drops perceptibly Sometimes also it would dip inward too much and the aviator could be seen leaning outward in order to set the balancing planes and bring the machine to a level keel As it is only about half the weight of the Wright machine the Curtiss aeroplane does not feel the effects of centrifugal force nearly so much in making a turn and consequently it can negotiate a rather sharp curve with but very slight inclination inward to keep it from skidding The control of the machine by means of a single vertical wheel in front of the aviator (which is pulled or pushed for going up and down and turned for steering sideways) is exceedingly simple and should make it easy for any one used to an automobile and a bicycle to learn to operate it with but little instruction



Copyright 1909 by Underwood & Underwood

GLENN H CURTISS FLYING FOR THE SCIENTIFIC AMERICAN TROPHY

In the Aeronautic Society's new biplane Mr Curtiss flew between 25 and 30 miles in 52½ minutes near Mineola, L. I., last Saturday

While Mr Curtiss's record of 52 minutes and 30 seconds will no doubt be increased before the end of the year it is by no means to be despised for a beginning The only record that approaches it in this country was that made by Orville Wright at Fort Myer when he remained aloft 1 hour 14 minutes and 24 seconds last September This flight of Mr Curtiss does not entitle him to the trophy immediately If any other aviator succeeds in outdoing Mr Curtiss's performance then the trophy goes to him Who wins the trophy for 1909 can be determined only at the end of the year for according to the rules the trophy will be won by the aviator who makes the best performance during the year If, during the present year, any other aviator surpasses Mr Curtiss's record made last Saturday it is probable that Mr Curtiss will make another attempt to beat the new record Should he put up the best record for 1909 he will have to win the cup for but one more year to become its permanent holder.

It is especially gratifying to the publishers of the Scientific American that the handsome trophy which they gave to encourage aviation in America, has resulted in the production of two such excellent machines as the "June Bug" of the Aerial Experiment Association (which won the trophy last year) and the new Curtiss machine, which is now the property of the Aeronautic Society With this excellent beginning there is scarcely any doubt that the trophy will be the means of stimulating other inventors to devise and perfect their heavier-than-air flying machines, and probably another year will witness an aeroplane race for the trophy similar to the great automobile races held in recent years.

◆

A New Cross-Country Monoplane Record.

M Louis Bleriot, who is by all odds the most experienced aeroplanist in France, has lately made some excellent new records with his two machines Nos. 11 and 12, both of which have been illustrated in our columns. On June 25th, at Issy les-Molineaux, M Bleriot flew with his No 12 monoplane for 15½ minutes, making 11 complete circuits of the parade ground despite the fact that there was a rather strong wind blowing On the 26th ultimo he flew for 36 minutes and 55 3/5 seconds, and would have made a longer flight had it not been for the engine missing fire because of over-lubrication The motor used in this machine is a 25 H P three-cylinder air-cooled Anzani engine, which has given excellent results.

After the above-mentioned flights M Bleriot took this machine to Douai where he made a number of excellent flights for prizes. The latest and most sensational flight that this daring aviator has thus far accomplished was made on July 14th with his No 11 monoplane Starting from Etampes, he flew 20 miles across country to Toury, where he alighted and made a stop of 11 minutes. Re-ascending he flew 13 miles farther to Chevilly, where the flight terminated The total duration of the two flights was 45 minutes, which means that the 33 miles was covered at an average speed of 40 miles an hour The fact that this machine, with a weight of 700 pounds, travels at a 40 mile clip with but a 25-horse-power motor speaks well for the efficiency of the single monoplane surface. Both of Bleriot's monoplanes have flown in winds of from 12 to 15 miles an hour successfully and the new cross-country record which he has just achieved places this type of machine in the lead as far as practical point-to-point flying is concerned

Changes in the Patent Office Staff.

The President has appointed C C Billings first assistant commissioner of patents and F A. Tennant as assistant commissioner of patents. The position of first assistant commissioner of patents was created by the last Congress, as was that of examiner of classification, which is to be filled by E. D Sewall Mr Billings was formerly assistant commissioner Mr R. F Whitehead who formerly occupied the position of law clerk, has been made law examiner, Among other promotions are those of J H Lightfoot, J F McNab, and L. D Underwood to principal examiners, H Barker R. E. Marine, J H Carnes, E. Collins Jr, and F W Swanton to first assistant examiners, T L. Mead Jr and W I Wayman to second assistant examiners and H. E Smith to third assistant examiner For the first time in the history of the Patent Office reductions in rank were also made. Two principal examiners have been made assistant examiners.

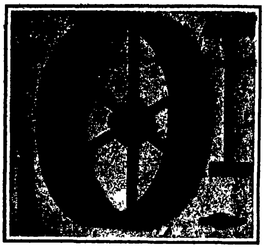
◆

Defects in insulators may be due, not to improper constituent parts, but to annealing. They may be discovered by means of polarized light. Each insulator is mounted, for purpose of test, so that when rotated about its pin axis the same thickness of glass skirt is between the polariser and analyser, which has previously been arranged so as to allow no light to pass. Stresses in the insulator are shown by varying intensity of light and by color changes, being due to improper annealing. Under service conditions the insulators become heated owing to conductive leakage, and are destroyed if the annealing has not been carefully done.

Patent Department

A NEW TYPE OF SPLIT PULLEY

The pulley illustrated in the accompanying engraving has been designed with a view to combining the advantages of the wooden type with those of the steel type of pulley In the improved construction a wooden rim *A* is used with a metal hub *B* and spokes *C* The spokes or arms are attached to the hub and rim without rivets or screw threaded parts They are made of seamless steel tubing pressed into a ribbed form as shown in Figs. 2 and 3 so as to increase their rigidity The hub which is preferably of malleable iron is formed with bosses, each of which is provided with a double-tapered orifice The arms are driven into the orifices in the bosses and by means of a swage their inner ends are flared out so as to fit the orifice and form a flange, as indicated at *D* in Fig 4 The spoke is also formed with a flange *E* which fits against the outer surface of the boss Thus the arm is held against radial movement in the hub The opposite end of each arm is flattened to enter a saddle *F* (Fig 5) which is fitted into the wooden rim of the pulleys. The arm is secured in the saddle by means of a pair of transverse pins, which pass therethrough and enter the wooden rim It is to be understood that the hub and spokes are first completed, and then the rim is built up and the saddle is fitted into the rim during its construction The saddles are also made fast to the rim by means of screws This pulley, it will be observed combines the strength of the steel pulley at the hub with the lightness and friction surface or grip of a wooden pulley The construction is very strong, and not liable to break apart in use

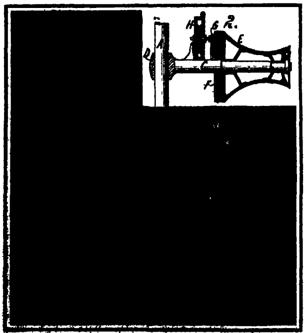


A NEW TYPE OF SPLIT PULLEY

A patent on this improved pulley has been secured by Messrs. R H Noble, T C. Hook, and C S Hook of 79 Victoria Street Toronto, Ontario Canada.

PORTABLE WINCH.

The transfer of heavy material along the low, narrow drifts of a mine may be greatly facilitated by the use of a winch such as illustrated in the accompanying engraving. This winch is arranged to be attached securely upon the walls of the passage but in such a manner that it may readily be removed and set up at any other point as the transfer of material may require A post, *A*, is provided which is adapted to be used in connection with an adjustable extension piece *B*, of suitable length to secure the post in upright position between the floor and roof Extension pieces of different length are furnished to provide for passageways of different height An arm *C*, is fastened by means of a clamp, *D*, to the post *A* at any convenient height thereon A windlass drum *F* is mounted in turn on the arm *C* being held in place by a collar secured to the end of the arm The inner end of the drum is provided with an internal gear, *F* meshing with a pinion *G* The latter is secured to the shaft of a motor *H* which is preferably a turbine propelled by means of air or steam fed through the pipe *J* Any suitable means may be used for controlling the motor so as to start stop or reverse the winch *E* Owing to its simplicity and portability many useful applications for the winch should be found in a mine Mr Charles Wick, of Bingham Canyon Utah, has just secured a patent on this improved winch

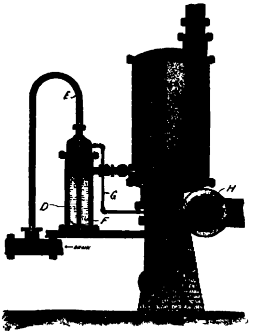


PORTABLE WINCH FOR USE IN MINES.

◆

AUTOMATIC DRAIN FOR COMPRESSORS.

In certain types of gas compressors it is common practice to inject water either into the compressor or into the discharge pipe therefrom so as to remove the heat of compression The accompanying engraving illustrates an apparatus designed to separate the water from the gas automatically after it has absorbed its quota of heat and withdraw the water from the separating chamber while maintaining a constant water level in the latter, at the same time preventing the loss of any gas withdrawn from the separating chamber in solution in the water As shown in the illustration the gas and water, under high pressure enter by way of pipe *A* the separating chamber *B* The gas passes through pipe *C* to the storage chamber while the water collects in the bottom of the separating chamber *B* A pipe connects the chamber *B* with a float chamber *D* from which a siphon tube *E* leads to the drain The siphon tube reaches nearly to the bottom of the float chamber *D* and its lower end is adapted to be opened or closed by means of a float *F* in this chamber The float *F* is in the form of a cylinder open at the upper end, while within the float at the bottom is a gasket, which is adapted to be pressed against the end of the siphon tube when the float is buoyed up by the water in the float chamber *D* As the water accumulates in the float chamber *D* it overflows into the float *F* and gradually weighs it down until the end of the siphon tube is uncovered Thereupon the water in the tube is siphoned off until the water level in the float is lowered to such an extent that it will rise again and close the tube The end of the siphon tube *E* is so far below the level of the water, that there is no possibility of the gas flowing off therethrough and the water level in the float chamber *D* remains at approximately the level of the upper edge of the float hence it always covers the inlet pipe connecting the chambers *B* and *D* This prevents gas from escaping directly from chamber *B* into chamber *D* but even should any gas escape into chamber *D* it would be carried off through the pipe *G* to the suction pipe *H* leading to the compressor Mr William D Mount of Saltville Va. has secured a patent on this drain for compressors



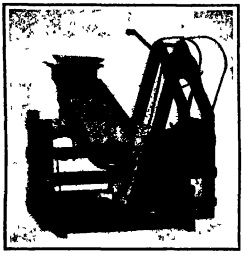
AUTOMATIC DRAIN

◆

PANNING WITHOUT WATER.

BY ROLAND ASHFORD PHILLIPS

No longer need the patient prospector have water in order to pan his gold bearing sand and gravel, no longer must he turn his back upon the great stretches of desert because water is not available For now comes the "dry" machine using air which is always available and which it is claimed will save every bit of "color" that water would save and do the work more expeditiously

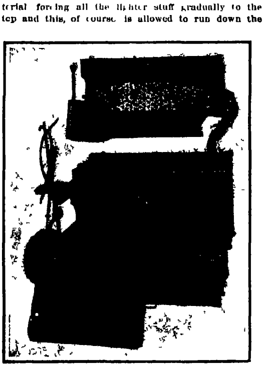


SIDE VIEW OF DRY-GOLD-WASHING MACHINE SET UP READY FOR USE

The one crank operates both machine and blower The sand and gravel are fed in at the hopper on top and allowed to run down the sluice quite in the same manner as in hydraulic sluicing Here however the sluice itself operated by a simple eccentric is given a side shake motion to further separate the particles and to increase the travel of dirt through it

As may be seen in the illustration the bottom of this sluiceway contains a series of riffles These in themselves are unique and prove to be the vital part of the invention Instead of projecting above the surface of the sluiceway as in most sluice boxes they consist of a series of depressions Each depressed riffle or pocket is straight across at the upper edge sloping at the sides curved at the lower edge and having the bottom of the pocket so formed sloping in the opposite direction to the inclination of the sluice The metal forming the bottom of each pocket is continuous at its lower edge with that of the sluice but terminates at the upper end of the pocket at a point vertically below the upper edge of the pocket The opening thus formed in each pocket is covered with a fine wire screen

Under the sluiceway is a chamber air tight except for the screen covered openings of the pockets into which the air is led from the blowing engine This air escaping through the upper opening in each pocket effects an agitation of the gold bearing material forcing all the lighter stuff gradually to the top and this, of course is allowed to run down the



TOP VIEW OF MACHINE, TAKEN APART AND PACKED IN TWO TRUNKS.

incline and is dumped A clean up simply means an unlocking of the riffles and the brushing out of the heavy deposit that remains in the multitude of pockets

The pan shown in the illustration and furnished with each machine holds approximately one twentieth of a cubic yard of gravel Or in other words seven times as much as the ordinary pan This amount of material can be run through the machine in about five minutes. Afterward the riffles are cleaned the deposit saved and a note taken of the location In his spare moments the prospector can compare notes and find out the most valuable location for serious work In this manner a man can travel over a great stretch of ground in a remarkably short time and when completed can decide upon the spot that has given him the most colors

The advantages of this machine are obvious even to those who do not understand mining What appears to be of the most vital importance is the fact that the prospector can go anywhere and at any time without fear of not finding water This means that the countless thousands of acres of desert and arid lands known to be extremely rich in gold bearing sands yet destitute of moisture can now be easily and thoroughly prospected

A great number of these machines are in daily operation especially in the arid regions of Colorado and Nevada and their success is vouched for by the many prospectors who are only too happy to be free to go where they choose and be rid of the drudgery of the crude pan and primitive methods that previously existed Not the least advantage of this prospector's machine lies in the fact that it can be readily taken apart and shipped in two trunks as the illustration shows Packed thus and checked as baggage it will hardly weigh over 200 pounds Unpacked and set up the weight is 180 pounds and one man can carry one without much trouble

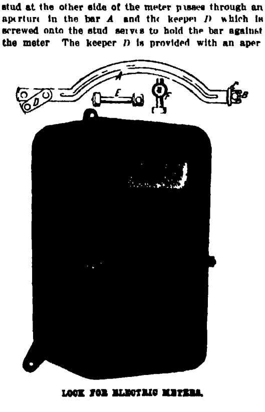
LOCK FOR ELECTRIC METERS

A very simple and inexpensive lock has recently been devised for use on electric meters The lock cannot be opened without breaking a seal and hence it will reveal any tampering with the meter by an unauthorized person The lock is particularly adapted for that type of meter in which the cover is secured by two studs on which a pair of keepers are threaded It comprises a bar *A* which extends across the face of the meter and is made fast to the two keepers in such a way as to keep them from being unscrewed from the studs One of the keepers which is screwed onto the stud *B* is provided with an outwardly projecting flange *C* in which there is a slot When this keeper has been screwed down against the cover of the meter one end of the bar *A* is passed through the slot This end of the bar is bifurcated so as to fit around the stud *B* as shown in the drawing The stud at the other side of the meter passes through an aperture in the bar *A* and the keeper *D* which is screwed onto the stud serves to hold the bar against the meter The keeper *D* is provided with an aperture adapted to be brought into register with an aperture in the bar and when the keeper has been screwed home a seal is passed through the two apertures The seal consists of a leaden stud such as shown at *E* On the projecting shank of the stud a collar of lead is fitted and by means of a punch both collar and shank are flattened and jammed together while an impression is left on the seal as indicated at *F* It will be observed that the locking bar *A* is curved so as not to cover the volt and ampere readings of the meter A patent on this improved lock has been granted to Mr Joseph H Jackson of 343 Atlantic Avenue Brooklyn N Y



LOCK FOR ELECTRIC METERS.

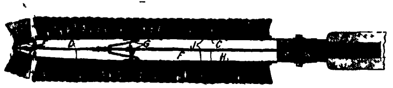
EXPANDING BRUSH FOR CLEANSING BOTTLES



EXPANDING BRUSH FOR CLEANSING BOTTLES

A new form of brush has just been invented which is so arranged that after it has been introduced into the bottle it may be expanded to conform to the shape of the bottle and thus render the cleansing of the interior more thorough. While the device is particularly adapted for cleansing milk bottles it may also be employed advantageously for other purposes in which it is necessary to introduce a brush through a small mouth or neck In our illustration the head *D* of the brush is attached to the spindle *B* of the bottle-washing machine Secured to the head are two flexible strips *C* of spring metal Attached to these flexible pieces are a pair of extension strips *D* which at their opposite ends are connected by a pair of hinged leaves *E* A controlling slide *F* is attached to the leaves *F* at one end while its opposite end enters a slot in the head *A* The controlling slide *F* is connected to the flexible strips *C* by means of links *G* The backs which carry the bristles of the brush are directly secured to the strips *D* and leaves *F* but in the case of the flexible strips *C* clips *H* are provided which are riveted to the strips *C* and are arranged to have sliding engagement with flexible backs *J* on which the bristles are secured The operation of the device is very simple When the brush is introduced into the bottle the controlling slide *F* comes in contact with the bottom of the bottle and is thus forced back into the slot in the head *A* This causes the leaves *F* and links *J* to swing open thereby expanding the brush to conform with the inner contour of the bottle Messrs John T Heywang Jr and Minard Slater of 201 West 73d Street New York city have secured a patent on this expanding brush

APPARATUS FOR PURIFYING WATER BY THE INJECTION OF OZONE

The apparatus shown in the accompanying engraving purifies water by the introduction of ozone through an aspirator Either direct or alternating current (usually at 110 volts) is taken from the ordinary electric light circuit and by a transformer is stepped up to about 8 000 volts This high voltage produces in the ozonizer (a box containing alternate plates of aluminium and micanite) a slight electric discharge generating ozone from the air drawn through the ozonizer

The water to be treated flows under its own pressure from the city mains through the pipe to its highest point and in descending draws the ozone by means of an aspirator from the ozonizer the water and ozone thoroughly commingling This action is continued during the progress of the water in its descent into the glass sterilizer where the ozone ascends in millions of minute bubbles again coming into intimate contact with all parts of the water and destroying the bacteria therein The ozonized water then finds an outlet at the top of the sterilizer and may be conducted into any suitable storage receptacle for future use

The reason for this destruction of the bacteria by the ozone is very simple Chemical analysis of the bodies of bacteria shows that they are made up of about 84 per cent of water and 16 per cent of solids Of these solids more than half is made up of carbon Ozone being a concentrated form of oxygen has a very great affinity for carbon and the moment a bacillus comes in contact with a bubble of ozonized air the carbon of its body combines with oxygen and the bacillus is consumed as completely as if it had touched a flame The product of combustion is carbonic acid which is partly absorbed by the water the excess rising to the surface of the water and passing off into the air

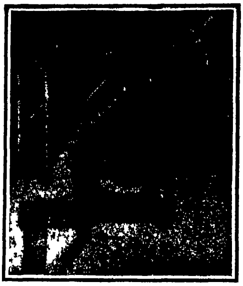
The cost of purifying water by this process is but a small fractional part of a cent per gallon

With six feet of overhead space the apparatus is capable of purifying 4 000 gallons of water per day and can be accommodated on a shelf three feet long and one foot wide the area required being only slightly increased for larger installations

PURIFYING WATER BY THE INJECTION OF OZONE THROUGH AN ASPIRATOR.

PAPER HANGER'S TRIMMER.

Pictured in the accompanying engraving is a paper hanger's table of improved design with a device mounted thereon whereby wall paper may be cut and trimmed with clean edges The table is of the folding type and is so arranged that when folded it occupies an unusually small compass The surface of the table is inlaid at one edge adjacent to the cutter with strips of wood of different color, and is provided with a scale extending at right angles to the inlaid strips. This serves as a gage for cutting the paper to the desired dimensions The cutter may be removed from the table top when it is desired to fold the table The sectional view in our engraving shows the details of the cutting device It consists of a cutting wheel or disk *A* which is arranged to be moved laterally by means of a thumb lever *B* against a straight edge so as to insure a clean cut The shaft on which the cutter wheel is mounted carries a roller *E* at the opposite end which is pressed against the table by the operator when moving the cutter over the paper *D* To protect the hand from the rotating parts a cage *C* extends over the shaft and roller *E* and this is grasped by the hand of the operator with the thumb conveniently placed on the lever *B* The carriage on which the cutter is mounted is provided with fingers *F* which engage a guide rail mounted on the table top parallel with the straight edge Were it not for the lever *B* which enables the operator to press the cutting disk *A* against the straight edge any inequalities in the guide rail would separate the wheel slightly from the straight edge causing a ragged cut of the paper



PAPER HANGER'S TRIMMER.

The inventor of this improved paper hanger's trimmer is Mr E F Goble Brattleboro Vt

RECENTLY PATENTED INVENTIONS.

Of General Interest.

WALL CONSTRUCTION.—G. P. White, Wallace, Idaho. The invention refers to concrete blocks, and its object is to provide a construction, arranged to form air spaces between the outer and inner courses, and to allow a perfect circulation of air through the spaces both in a horizontal and vertical direction, with a view to prevent the penetration of moisture through the wall to the interior of the building.

CABLE-SQUEEZER.—H. D. Robinson, New York, N. Y. The aim of the inventor is to provide a device which may be easily and quickly applied to the mass of strands making up the cable, which will force them together into a perfectly cylindrical mass, and which may be very readily loosened and moved after the permanent securing means has been applied adjacent the point last squeezed into shape.

Heating and Lighting.

WATER-HEATER.—O. C. Syvertsen, Taunton, Mass. This heater is adapted for domestic purposes, and more especially for use in connection with the boiler of a steam heating system to replace or augment the water front of the range. The heating chamber consists of a cylindrical body having expanded heads secured at opposite ends, a coil within the chamber and an inlet and outlet to and from the chamber for circulation of the heating fluid. Where the coil return and supply pipes pass into the head the inventor provides outwardly projecting nipples surrounding the pipe, the former having packing nuts, and thus forming in connection with the pipes annular heating spaces in communication with the chamber.

Machines and Mechanical Devices.

ATTACHMENT FOR LOOMS.—W. P. Watson, Middletown, Conn. The invention has in view a suitable mechanism in connection with a loom for raising and lowering the weights used to maintain a tension on the warp. Two weights are simultaneously raised and lowered by mechanical means preferably operable from the front of the machine, which means permits of a heavier weighting and consequently the lengthening of the warp and an increase in production.

TUBULAR TRITURATING MILL.—R. R. Shaffer, New York, N. Y. The invention is an improvement in mills of the character which contain a quantity of pebbles, spheres or other pulverizing elements. In machines of this nature the material to be ground is introduced into the grinding tube having the pebbles, and as it revolves they roll upon each other and reduce material to powder. The inventor's aim is to get rid of the large per cent of dead weight of the pebbles and increase the mill's grinding capacity.

FRICTION-CONTROLLING DEVICE.—S. J. Dibbins, New York, N. Y. The device insures the easy working of the friction clutch, reduces the friction of the working parts to a minimum, and avoids weakening of the drum shaft. Use is made of a device external of the shaft, and having a spring-pressed pressure device engaging a grooved collar on the movable clutch member and a normally-controlled pressure nut screwing on a pressure screw on the pressure device.

OPERATING TABLE.—J. Laughlin, Ledyard, Iowa. Dr. Laughlin in this invention provides a table that may be adjusted in a variety of positions, being capable of rising and falling movement, rotary movement, tilting on its longitudinal axis, and tilting on its transverse axis, and also an infinite variety of combinations of the two tilting movements.

LADDER.—I. R. Conkoff and B. S. Lovett, Portland, Ore. The ladder is for use by firemen, it being capable of considerable and rapid extension, adapting it for use in connection with tall buildings. One embodiment of the invention consists of a ladder composed of a series of sections of varying widths telescoped one within the other and a gear mechanism for driving the several sections, causing them to simultaneously move with respect to each other.

Note.—Copies of any of these patents will be furnished by Munn & Co. for ten cents each. Please state the name of the patentee, title of the invention, and date of this paper.

NEW BOOKS, ETC.

Cane Sugar and its Manufacture. By H. C. Prinsen Geerligs, Late Director of the West Java Sugar Experiment Station. Manchester (Altringham): Norman Rodger, 1909. Levant octavo; pp. 350.

Mr. Geerligs has collected in this book pretty much everything that is known about the chemistry and technology of sugar cane and cane-sugar manufacture. In a way the book may be regarded as a supplement to Noel Deerr's work on sugar and the sugar cane, for it carefully avoids the discussion of machinery which finds so prominent a place in Deerr's work, and confines itself largely to the chemical side of sugar cane. The chapters are seven in number, and their subjects are respectively "Constituents of the Sugar Cane," "Proportion and Distribution of the Constituents of Sugar Cane," "Extraction of the Juice," "Clarification," "Concentration of the Juice," "Curing" and "Exhausted Molasses."

Électricité Agricole. Par A. Petit, ingénieur agronome et ingénieur électricien. 1909, 1 volume in 18 de 400 pages, avec 100 figures. Librairie J.-B. Baillière et fils, 19 rue Hautefeuille, à Paris.

M. Petit first presents some general considerations on the adaptation of electricity to the farm, energy and some general theories in electricity. He then considers the production of electric energy by all possible practical means—dynamos, water motors, steam engines, gas engines, gasoline engines, and windmills. He lastly sets forth the comparative merits of these various methods, cost of each installation, and the mechanical and electrical conditions involved. Inasmuch as electrical energy is conducted by wires to the machines which it is intended to drive, he naturally describes the apparatus employed between generating and receiving stations in a chapter entitled "Transportation and Distribution." The energy thus conveyed is utilized in various forms. How it is utilized, a chapter on utilization explains.

The Fireless Cook Book. A Manual of the Construction and Use of Appliances for Cooking by Retained Heat. With 250 Recipes. By Margaret J. Mitchell, Director of Domestic Science in Public Schools, Bradford, Pa.; Instructor in Domestic Science, Drexel Institute, Philadelphia, Pa. New York: Doubleday, Page & Co., 1909. Price, $1.25.

The fireless cooker is another name for the insulated oven or hay box, which has been introduced into this country from Europe. By its means food is subjected to a brief preliminary cooking and placed in the hay box, where the cooking process is continued for some time after without the aid of fuel. It is the purpose of this book to present in a convenient form directions for making and using fireless cookers, so that those who are not experienced even in the ordinary methods of cookery may be able to follow them easily and with success. Naturally a book such as this must be used in the kitchen before any opinion as to its practical value can be delivered. It seems to us, however, that the book has been well designed to attain the object for which it is written.

The Westinghouse E-T Air Brake Instruction Pocket Book. By W. W. Wood. New York: Norman W. Henley Publishing Company, 1909. 16mo.; pp. 242. Price, $2.

This is an admirable example of what a technical book should be. The illustrations are mostly in the form of plates, and are appropriately colored to distinguish the various pressures. We have rarely seen better examples of fine color printing. The register is most accurate, and the coloring will tend to simplify the descriptions for the student. The publisher has taken the very wise precaution of copyrighting every individual illustration. It is strange that more publishers do not do this, as it would save them from the vast legion of pirates that are always ready to snap up every good book. The author is a practical air brake instructor. The examination questions are given in the popular question-and-answer form. It is a beautiful example of book making, and reflects the greatest possible credit upon the publisher.

The Real Estate Educator. By F. M. Payne. New York: T. J. Carey, 1908. 18mo.; pp. 256. Price, $2.

This is a repository of useful information for ready reference especially designed for real estate agents, operators, builders, contractors and business men. The advice given seems to be very sensible, and the book will probably be of value to those who are engaged in buying or selling real estate.

Engineers' Manual for Installation and Operation of the Reeves Variable Speed Transmission. Columbus, Ind.: The Reeves Pulley Company, 1909. 24mo.; pp. 59. Price, $1.

INDEX OF INVENTIONS

For which Letters Patent of the
United States were Issued
for the Week Ending
July 6, 1909,

AND EACH BEARING THAT DATE

[See note at end of list about copies of these patents.]

Abrasive machine belt, D. S. Oakley	927 096
Abrasive wheels, safety collar for, D. R. Hyde	927 145
Acetate of lime, making, R. W. Erwin	927 175
Adding and recording machine, D. O. Gray	926 738
Air brake, A. J. Wisner	927 016
Air compressor, T. O. Perry	927 162
Air drying method and apparatus, D. Baker	926 973
Alloys, making, J. T. H. Dempster	926,960
Animal shears, W. M. Cahill 926,726,	926,727
Animal trap, A. O. Kempelien	926,860
Animal trap, M. Johnson	927 149
Armature for electric machines, W. J. Bauroth	927,309
Asphalt spreading apparatus, liquid, O. A. Baldwin	927 318
Automatic carrier, E. H. Libby	926,924
Automatic multiplex press, D. W. Custer	927 122
Automatic sprinkler, G. I. Rockwood	927 490
Automatically opening and closing dies, F. A. Errington	927,080
Automobile axles, combined driving and steering wheel for, S. V. Dusseau	926,929
Automobile steering gear, G. H. Hill	927 148
Automobile transmission gears cover for, H. V. Young	926,800
Automobiles transmission gearing for, M. L. Williams	926,797
Autopiano, W. F. Bayer	926 921
Axle box for locomotive drivers, E. Fuller	926,862
Baggage rack, W. S. Haum	927 235
Baling press, J. R. Browning	927 409
Ball and socket flexible joint, G. F. West	927 391
Ball cups, making, A. G. Anderson	927 311
Ballot box, Sullivan & Black	926,779
Ballot box, A. Page	927 068
Bearing, ball, E. Sachs	926,771
Bearing casings, detachable lining for roller, C. I. Shirley	926 906
Bearing, roller, J. F. Parrish	927 100
Bearing yoke driven by shaft, roller, Steenstrup & Lockwood	926,967
Bed, W. H. Cling	926,854
Bed attachment, D. A. Carson	926 840
Bell, swinging, W. P. Elliott, Jr.	927 173
Belt shifter, F. A. Carlton	927 222
Billiard cue, L. Kalmanowitz	927 150
Binder, loose leaf, M. M. Smick	926 901
Blanket grip, C. Ross, Jr.	927 260
Blanks, cutting, F. S. Stiles	927 201
Bleaching, F. Fuhrmann	927 457
Bleaching and preparing straw from the Southern palm, F. [illegible]	926,705
Blinds, mechanism for operating Venetian, F. C. Thompson	926 811
Block signal system, A. G. Davis	927 404
Boiler flue, J. M. Cramer	927 329
Boiler flue cleaner, W. J. Bradley	926 722
Bookcase, W. W. [illegible]	927 370
Boot and shoe, T. C. Young	927 017
Boot cleaner, E. O. Killerbrue	926,740
Bottle, nursing, R. A. Van Cleave	927 011
Bottle opener, J. Hough	926 907
Bottles, jars, and the like, stoppering, M. Quillet	926 895
Bottles with aerated waters, machine for filling, W. J. & J. Forrester	927 228
Bowl or tureen, O. A. Bochm	927 102
Brake, W. S. Adams	926 920
Brake shoes, forming steel backs for, H. Jones	926 875
Branding appliance, self heating adjustable cattle, W. G. Landells	926 861
Brick drying rack, E. H. Callaway	926,921
Broom hanger, J. H. Ashmead	927 209
Brush bridle, R. C. Glindorff	927 [illegible]
Buckle, baling tie, C. H. Heath	927 041
Buckle, belt, J. Hough	926,908
Buffing machine, J. F. Call	927 009
Building block and wall constructed thereof, J. Rebaut	926,767
Building construction, J. D. O'Neil	927 273
Building material, J. Schirra	926 773
Bunching and counting machine, H. Smithwick	926,904
Burglar alarm, J. B. Nash	926 817
Butter server, O. W. Moberg	927 198
Cabinet, A. H. King	926 916
Cable grip, J. C. Dawson	926 926
Cable hanger, J. F. Eclock	927 032
Cable joint, self soldering, W. Reid	927 166
Cable terminal, electric, C. W. Davis	926,857
Calculating machine, A. C. Cornelison	927 452
Calendar, H. B. Young	926,799
Calendar pad and stand, memorandum, W. M. Chamberlin, Jr.	926,863
Camera, photographic, Vogt & Dietz	926,912
Cameras, magazine plate holder for, F. I. C. Morse	927 063
Can heading machine, multiple, Adriance & Calleson	927 310
Candy articles, making hollow, J. F. Sigrist	927 485
Car bolster, J. A. Lamont	926 702
Car coupling, R. D. Gallagher, Jr.	927 138
Car coupling, C. Dobbs	927 331
Car coupling, A. Moritz	927 4[illegible]
Car coupling, H. C. Crigger	927 453
Car door, A. A. Davis	927 132
Car door, grain, Douglas & Robinson	927 335
Car emergency draft gear attachment, railway, G. H. Gilman	926 723
Car fender, street, A. Albers	927 441
Car stanchion, W. P. Scofield	927 [illegible]
Car steel underframe, railway, Robbins & Sharp	926 807
Car truck, I. Kavanaugh	926 810
Carburetor, A. C. Bennett	927 211
Carburetor, J. A. Carlson	926 848
Card counting and stacking machine, Sargent & Peebles	927 090
Carding engine and like machine, W. L. Holland	927 242
Cards, playing, S. A. Cohen	927 119
Case or box, E. J. Krementz	927 250
Casein, machine for grinding green, L. Axtell	926 801
Cash and package carrier propelling mechanism, L. B. Richards	927 212
Caster, R. C. Mathes	927 061
Caster truck bed, I. R. Chabassol	927 111
Centrifugal separator, J. A. B. Dominguez	926 850
Chair, T. P. Dearing	926 858
Chimney cowl, J. T. Proffitt	927 072
Chuck, lathe, J. G. Oliver	926 761
Churn, Neal & Gillette	926 700
Churn, O. G. Klein	927 358
Chute cart or wagon, A. Hartl	926 983
Cigarette manufacturing apparatus, O. Wartmann	927 106
Cleansing machine, F. W. & C. I. Reed	927 160
Cloth cutting machine, adjustable presser foot, H. A. Meyer	926 815
Clothes drier, J. D. Leen	926 814
Clothes drier, H. W. Sauler	927 17[illegible]
Clothes rack, W. L. Smalley	927 082
Clothes wringer swinging support, Ramby & Reichard	927 270
Clutch, pneumatic, J. C. Garrett	927 229
Coal picking table, J. F. Jones	927 412
Coat hanger attachment, S. F. Weigle	926 701
Cock for gas ranges, gas, H. C. Burrows	926 922
Coil, C. Schrader	926 964
Collar, B. S. Ellis	927 134
Collar, C. I. Maunch	927 2[illegible]7
Column for buildings and other structures, E. V. Johnson	926 747
Compressed air engine, B. V. Nordberg	926 810
Concrete beam, reinforced, C. A. P. Turner	927 194
Concrete bucket, W. D. Lockwood	926 880
Concrete mixer, W. D. Clough et al	927 117
Concrete wall, I. H. Bosworth	927 215
Condenser, H. A. Hood	926 913
Condenser, A. Kaylenstjerna	927 201
Condensing fumes, H. A. Hood	927 241
Conduit system, third rail, I. M. Reynolds	927 428
Confectionery holder, F. J. Adams	927 196
Control apparatus, G. H. Hill	927 105
Convertible chair, F. T. Marsh	926 992
Conveyers, deflector for gravity, M. C. Schwab	927 176
Cooking vessel extensible support, J. Wahl	927 190
Cork extractor, G. H. Argo	926 889
Corkscrew, R. De Berasques	927 127
Corn, machine for separating silk from green, H. H. Illery	927 086
Cotton chopper, C. E. Delano	927 128
Cotton picker, M. B. Coe	927 118
Cotton picker and cleaner, hull, J. J. Hart	927 370
Counter molding machine, W. J. Young	927 204
Counter, recording, A. P. Phillips	926 763
Cover or closing disks, machine for making, F. L. Nichols	927 002
Crate, knockdown shipping, W. English	926 931
Crate, shipping, D. J. Harding	926 941
Cream separator, W. Kolvig	927 380
Crusher, M. G. Bunnell	926,723
Cultivator shield, corn, F. G. Timm	927 206
Cupboard and bed combined, O. Knutson	926,948
Current indicator or detector, C. D. Babcock	927 314
Current motor, alternating, E. F. W. Alexanderson	927 398
Currents, rotary converter for direct, L. A. Hawkins	927 142
Curtain pole, A. C. Butcher	927 108
Curtain rod, A. T. Howland	926,945
Cushion, A. H. Ordway	926,981
Cuspidor, F. S. Fellion	927 156
Cuspidor cover, L. R. & J. R. Wilson	927 307
Cutter, R. W. Jones	927 347
Cutter head, O. L. Sturee	927 496
Cycle motor, G. M. Hornecker	926,745
Dating and delivering apparatus, ticket, R. W. Bell	927,050
Dental hammer, automatic, R. P. Lyle	927,[illegible]
Dental instrument tray, J. Brun	926,977
Derrick, sectional, W. E. Carmony	926,995
Desiccating apparatus, J. Rauh	927 109
Developing apparatus, daylight, J. W. Meek	927 165
Diaper fastener, infant's, W. M. Conrad	927 120
Dictograph, W. F. H. Gerner	927 230
Die plate, multiple, W. R. Gwin	927 401
Dish washing machine, J. J. Holley	926 744
Disinfectant apparatus, F. D. Raforth	926 901
Disinfectant holder, I. Duenwald	927 159
Display cabinet, seed, Jobes & Snow	926 869
Display rack, knife, C. P. Catlin	926,852
Door hanger, G. W. Stuyterman	926 778
Door hanger, sliding, J. W. Ohl	927 272
Doubling and twisting machines, stop motion device for, F. W. Rochelle	927,285
Dough mixer, pie and biscuit, E. I. [illegible]	927 387
Draft gear, A. I. Stauffer, 927 092	927 393
Draft rigging, J. J. Dippel	927 353
Drain or sewer pipe, W. L. Jackson	927 333
Drier. See Clothes drier.	
Drill socket, H. E. Bradley	926 845
Driving mechanism, foot power, J. F. Wilkinson	927 301
Drum, beating, W. S. Keyser	927 356
Dumping elevator, F. B. Symons	926 909
Dust pan, A. W. [illegible]	926,927
Dyeing, bleaching, etc., apparatus for, A. W. Thompson	926 782
Electric contacts, device for cleaning or truing, J. A. J. Haslop	927 042
Electric heater, E. Schluter	927 173
Electric insulation system, N. C. McClure	927,375
Electric lock, T. C. Nixon	926 900
Electric machine, dynamo, I. A. Lape	927 274
Electric machine, dynamo, R. A. Behrend	927 318
Electric protection system, C. I. Carpenter	927 111
Electric service circuits, connection block for, Swallow & McCoy	927 384
Electrical conductor junction box, J. F. Burns, 927 218	927 210
Electrical selector, E. A. Faller	927 455
Electrical switch, R. H. Manson	926,951
Elevator door counterbalancing, A. Tolf	927 012
Elevator safety device, mine, J. K. Williams	927 440
Engine, C. Tuckfield	927 297
Engine muffler, explosive, C. A. Jackson	927,240
Engine sparking mechanism, explosive, G. Germani	927 346
Engines, air heater for compressed air, Shonnard & Dieter	927 434
Envelop, church offering, J. H. Earle	927,339
Envelop, safety, J. W. Carr	927 113
Evener bar, Whipple & Johnson	926,917
Excavator, multiple, C. C. Jacobs	926,746
Expansion bolt, H. W. Mower	927 064
Explosion engine, J. & F. O. Peterson	926,962
Explosive engine, L. Pettersen	927 001
Eyeglasses, L. F. Adt	926,728
Eyeleting machine, R. H. Smith	926 903
Eyeleting machine, W. F. Lautenschlager	926,949
Fan blower, D. J. Bemiller	927 319
Fare collector, J. H. Coleman	927 451
Fastening device, F. H. Richards, 926 708	927 107
Faucet, safety, R. P. Wilson	927 308
Feed bag, W. J. Rayburn	927 073
Feed bag, D. I. Toland	927 193
Feed motion device, F. J. Waters	926,918
Ferrules or rings, die for forming plastic compound, F. Miltner	927 421
Fertilizer dropper and planter, L. B. Thomas	927 084
File, F. Rustin	926,829
File cabinet, I. S. Morris	926,709
File card, S. T. Walton	927 381
Finishing nail, J. J. Simon	927 291
Fire apparatus, device for raising and lowering, C. M. Dean	927 126
Firearm, S. [illegible]	927 070
Firearm, I. I. Hepburn	927 464
Fire bucket, D. B. McLaughlin	926,966
Fire door, T. E. Collins	926,978
Fire escape, J. Krammer	927,056
Fire escape, W. H. Jay	927 148
Fireplace, C. I. Taylor	926,910
Fish plate, L. W. Ackerson	927 394
Flax puller, W. G. Griffin	927,030
Floor surfacing machine, A. F. Johnson	927 400
Flooring, sanitary, N. J. Clayton	927 028
Flushing tank float, H. C. Johnston	927 354
Flying machine, L. J. Brown	926,804
Flying machine, I. A. Wadleigh	926,913
Flying machine, M. B. Sellers	927,290
Furnace, T. S. Blair, Jr.	927 005
Furnace grate, steam generator, R. A. Tarr	927 295
Furnaces, stirring and conveying device for, U. Wedge	927 390
Furniture, etc., material for making articles of, H. B. Morris	926 908
Game apparatus, S. Bristow	927 106
Game apparatus, card, B. A. Staley	927 183
Garbage can, I. Gluckman	926 864
Garment, G. M. Gray	927 038
Garment rack, folding, A. May	927 389
Garment pressing machine, Schumann & Trepschal	927 081
Garment supporter, A. C. Davis	926 808
Garment supporter, D. Wertz	926 816
Garment supporter, J. H. Bryant	927 321
Gas fixture, self closing, C. Schmidt	926,774
Gas from wood, manufacturing, [illegible]	927 418
Gas generator, McDonough & Conway	926 [illegible]
Gas generator, acetylene, A. J. R. Marjenhoff	926 [illegible]
Gas, manufacture of producer, Crossley & Rigby	926 729
Gate, T. D. Cale	927 221
Gear wheels according to pattern, machine for producing, H. Lehmann	926 969
Gearing, A. N. Adams	926 919
Gearing, F. H. M. Van Swieten	927 395
Glass clamp, plate, I. Hartlaine	927 062
Glass closer, H. Blum	927 320
Glassware to leers, device for transferring, I. J. Robb	927 168
Gluing machine, loose wrap, Cohn & Kronheimer	927 224
Go-carts, foot rest for, A. J. Adams	927 099
Governor, vacuum, G. H. Reche	927 446
Grader drag, adjustable road, G. W. [illegible]	927 071
Grain separating machine, J. H. Cornwall	927 328
Grapple, C. I. Simmons	927 180
Grate, portable, W. H. Holland	927 214
Grease cup, C. J. Bushmeyer	926 923
Grinding disk, C. H. Richards	927 077
Grinding wheel, A. W. Luffer	927 164
Gun, breech loading, Farwell & Shafer	927 [illegible]
Gun training and firing mechanism, Meigs & Hammar	927 260
Hammer, power, H. J. C. Keymer	926 987
Handle. See Package handle.	
Harvester, beet, M. H. Wadham	926 837
Harvesters and binders, metallic conveyer chain for, S. C. English	926,806
Hat brim edges, apparatus for curling and ironing, G. Atherton	927 313
Hay rack, C. W. Baird	927 010
Hay rake and loader combined, B. A. Spinney	927 182
Heater, S. Keltonik	927 101
Heating system, E. H. Gold	926,714
Heel blanks, machine for cutting the lips of, G. B. Grover	927 140
Hide treating machine, short cylinder, A. H. Kohrhahn	926 811
Hinge, T. H. Maas	[illegible]
Hinge, double acting spring, M. A. Erickson	927 340
Hinge for electrical and other devices, spring, L. H. Moulthrop	927 373
Hitching strap fastening, V. O. Parker	927 275
Hoist, S. H. Libby	927 417
Holdback hook, I. D. Cady	927 220
Hook and eye, J. P. Schoeppl	926 775
Hose connection, I. S. Dunmyer	927 430
Hose coupling, Watkins & Millen	927 398
Hose nozzle, H. Nelson	927 376
Hose rack, A. Jones	927 410
Hunting knife, Hoglund & Olsen	927 302
Hydrocarbon burner, H. Lemp	927 316
Hydrocarbon engine, F. L. Nichols	927 004
Illuminating device, W. N. McComb	926,956
Incandescent mantles, manufacturing, A. Muller	927 374
Index, C. J. Bryant	927 167
Indicator, M. Arndt	927 207
Induction coil, A. K. Keller	927 413
Insulator, L. Steinberger	927 187
Insulator, J. T. Reed	927 [illegible]
Insulator and lightning arrester combined, W. F. Hiatt	927 048

Classified Advertisements

Advertising in this column is 75 cents a line. No less than four nor more than ten lines accepted. Count seven words to the line. All orders must be accompanied by a remittance. Further information sent on request.

READ THIS COLUMN CAREFULLY.—You will find inquiries for certain classes of articles numbered in consecutive order. If you manufacture these goods write us at once and we will send you the name and address of the party desiring the information. There is no charge for this service. **In every case it is necessary to give the number of the inquiry.** Where manufacturers do not respond promptly the inquiry may be repeated.

MUNN & CO.

BUSINESS OPPORTUNITIES

WANTED.—To interest capital in new safety razor. Patented and patent applied for. Very simple, has two sides and shaves light and clean without adjusting; has guide to shave at correct angle. Most beautiful handle. Take partners, sell outright or royalty. Send for folder and sample. Edward Kruslan, 880 N. 182d St., New York.

Inquiry No. 8868.—Wanted to buy nickeloid for buttons.

OKLAHOMA TOWN LOTS. Only $40.00. $1.00 per week. Good investment. Sell 10 and get free return trip there. Exceptional opportunity. Investigate. Clarence E. Pang, 858 Rosemont Ave., Chicago, Ill.

PATENTS FOR SALE

FOR SALE.—U. S. and Canadian patent No. [illegible]. Adjustable standard and improved bolster for wagons. A leader. Manufacturers and wagon companies address C. M. Shotwell, Box 62, Kemmerer, Wyoming.

Inquiry No. 8904. For a dealer in tapes and cords for Venetian blinds.

FOR SALE. American Patent No. 924,084, a nail setter. An article every carpenter and cabinet maker will use. C. A. Gehnn, 808 S. W. Ave., Chicago, Ill.

Inquiry No. 8918. For manufacturers of "Wyatt's Electro-Catalytic Sparking Plug."

FOR SALE OR PLACING UPON ROYALTY.—Patent No. 922,075. Aeroplane, granted May 25, 1909. Full particulars on request. Address John Potts, Winchester, Ohio.

FOR SALE

FOR SALE.—Specialty for manufacturers. Dental floss holder patented May 1909. For further particulars apply direct to inventor T. A. Tubbs, Seattle, Wash., care H. S. Emerson Company.

Inquiry No. 8921. For the manufacturers of gilt paper.

HELP WANTED

YOUNG MAN graduate of some school in mechanical engineering for position in woodworking plant in small Tennessee town. Good opportunity for advancement. State experience if any and salary. Answer "Position," Box 773, New York.

Inquiry No. 8930.—Wanted the address of Worthington Boiler Co.

LISTS OF MANUFACTURERS

COMPLETE LISTS of manufacturers in all lines supplied at short notice at moderate rates. Small and special lists compiled to order at various prices. Estimates should be obtained in advance. Address Munn & Co., List Department, Box 773, New York.

Inquiry No. 8938. For the manufacturers of a steam rotary excavator as described in the Scientific American of December 1, 1906, page 347.

A LIST OF 1,500 mining and consulting engineers on cards. A very valuable list for circularizing, etc. Price $15.00. Address Munn & Co., List Department, Box 773, New York.

Inquiry No. 8951.—For parties who manufacture the Western Stump Borer for boring stumps.

Inquiry No. 8961. For manufacturers of machinery for making fly screens.

Inquiry No. 8965.—For the address of the Windsor Mfg. Co., manufacturers of waterproof collars and cuffs.

Inquiry No. 8966. Wanted the address of the [illegible] Motor Co.

Inquiry No. 8969.—Wanted machines that make accordion dress plaiting (steam).

Inquiry No. 8974. For address of firms interested in fishing reels.

Inquiry No. 8977. For manufacturers of machinery for manufacturing denatured alcohol.

Inquiry No. 8978. Wanted the address of manufacturers of dry pans or crushers to grind sand for plastering and cement works.

Inquiry No. 8980. For the address of manufacturers of mortars and pestles that are used by druggists.

Inquiry No. 8981. Wanted the address of the manufacturers of Cypress wash tubs.

Inquiry No. 8986.—Wanted to buy crown and flint glasses for telescope objectives.

Inquiry No. 8987. Wanted the manufacturers of the Van Winkle, Woods & Sons, and the Weber power motors.

Inquiry No. 8990. For information regarding shoes made of leather but similar to the same and are as durable.

Inquiry No. 8993. Wanted to buy round and oval glass paper weights, such as are used for mounting photographs.

Inquiry No. 8996. Wanted addresses of manufacturers of machinery for working orange wood manicure sticks.

Inquiry No. 8997. Wanted the address of the manufacturers of bread or cake boxes.

Inquiry No. 8999. For manufacturers of combined clothes and clothes pin receptacle.

Inquiry No. 9000. Wanted a combined appliance for holding hats, coats and umbrellas safely and securely.

Inquiry No. 9001.—For the address of progressive manufacturers of fruit jars.

Inquiry No. 9002.—For the address of the Varley Duplex Magnet Co. or anyone making and designing special electro magnets.

Inquiry No. 9003. For the address of parties who make "Invar" or other metals having a low coefficient of expansion.

Inquiry No. 9004.—Wanted to buy machinery suitable for grinding, sifting and preparing cooked cereals; also packing same in cartons.

Inquiry No. 9005.—For the address of manufacturers of 4 oz. cylindrical paper boxes.

Insulator bracket distributing A L Stadermann	926,906
Insulator high potential strain L Steinberger	927 196
Insulator tubular I Steinberger	927 195
Internal combustion engine, H W. Graef	927,283
Internal combustion heat engine, J L Bogert	927 103
Ironing board J H. Hartwell	927,327
Ironing board, Holmes & Swagerty	927 408
Ironing machine A Kreuter	926,751
Jar closure or fastener Weiher & Long	927,390
Jewel fastening ear C Weller	927 199
Jewelry J I Herzog	926,741
Joint E Berliner	926,974
Journal bearing self oiling F F Landis	927 301
Keratin producing digestible substances from C Neuberg	926,989
Kerosene burner H Lamp	926,993
Key receptacle F Robinson	926,963
Knob door G B Pickop	927 437
Knob screwless, A Arens	927 445

Noteworthy Articles

ON TIMELY TOPICS

Each number of the Scientific American Supplement costs 10 cents by mail.

SEWAGE AND ITS DISPOSAL. A review of modern methods. By H. LEMMOIN CANNON. SCIENTIFIC AMERICAN SUPPLEMENT 1551.

ELECTRIC LIGHTING FOR AMATEURS. How a small and simple experimental installation can be set up at home. SCIENTIFIC AMERICAN SUPPLEMENT 1551.

CHEMICAL AFFINITY. Simply explained by SIR OLIVER LODGE. SCIENTIFIC AMERICAN SUPPLEMENT 1547.

CASE-HARDENING. By DAVID FLATHER. SCIENTIFIC AMERICAN SUPPLEMENT 1547.

ELECTRIC IGNITION SYSTEMS. A comprehensive article by E. W. ROBERTS. SCIENTIFIC AMERICAN SUPPLEMENT 1546.

CONCRETE. A general article on its merits and defects. SCIENTIFIC AMERICAN SUPPLEMENT 1543.

REINFORCED CONCRETE. Some of its Principles and Applications with practical illustrations. SCIENTIFIC AMERICAN SUPPLEMENTS 1547, 1548, 1551.

ELECTRONS AND THE ELECTRONIC THEORY are discussed by SIR OLIVER LODGE in SCIENTIFIC AMERICAN SUPPLEMENTS 1428, 1429, 1430, 1431, 1432, 1433, 1434.

THE PANAMA CANAL is described from the engineering standpoint in SCIENTIFIC AMERICAN SUPPLEMENT 1539.

WIRELESS TELEGRAPHY. Its Progress and Present Condition are well discussed in SCIENTIFIC AMERICAN SUPPLEMENTS 1425, 1426, 1427, 1386, 1388, 1389, 1383, 1381, 1327, 1328, 1329, 1431.

HOW TO CONSTRUCT AN EFFICIENT WIRELESS TELEGRAPH APPARATUS AT SMALL COST is told in SCIENTIFIC AMERICAN SUPPLEMENT 1363.

SUBMARINE NAVIGATION. An exhaustive review of the subject is published in SCIENTIFIC AMERICAN SUPPLEMENTS 1414, 1415, 1222, 1223.

SELENIUM AND ITS REMARKABLE PROPERTIES are fully described in SCIENTIFIC AMERICAN SUPPLEMENT 1430. The paper is illustrated by numerous engravings.

THE INTERNAL WORK OF THE WIND. By S. P. LANGLEY. A painstaking discussion by the leading authority on Aerodynamics, of a subject of value to all interested in airships. SCIENTIFIC AMERICAN SUPPLEMENTS 946 and 947.

LANGLEY'S AERODROME. Fully described and illustrated in SCIENTIFIC AMERICAN SUPPLEMENTS 1404, 1405 and 1546.

STEAM TURBINES. Their Construction, Operation and Commercial Application. SCIENTIFIC AMERICAN SUPPLEMENTS 1306, 1307, 1308, 1422, 1400, 1447, 1370, 1372, 1521. The articles have all been prepared by experts in steam engineering.

PORTLAND CEMENT MAKING is described in excellent articles contained in SCIENTIFIC AMERICAN SUPPLEMENTS 1433, 1465, 1466, 1510, 1511.

AERIAL NAVIGATION. Theoretical and Practical Discussions. Pictures and Descriptions of actually-built dirigible balloons and aeroplanes will be found in SCIENTIFIC AMERICAN SUPPLEMENTS 1161, 1149, 1150, 1151, 1404, 1405, 1413, 1455.

THE TANTALUM LAMP. A full illustrated description of a lamp having a metallic filament and burning at once without preliminary heating appears in SCIENTIFIC AMERICAN SUPPLEMENT 1523.

THE WATERPROOFING OF FABRICS is thoroughly discussed in SCIENTIFIC AMERICAN SUPPLEMENT 1522 by an expert.

THE SPARK COIL, ITS CONSTRUCTION AND MAINTENANCE, is the subject of a painstaking article in SCIENTIFIC AMERICAN SUPPLEMENT 1522.

ELECTRIC IGNITERS FOR GAS ENGINES are discussed in SCIENTIFIC AMERICAN SUPPLEMENT 1514.

CARBURETERS, a subject of immense importance to automobilists and the users of oil engines, is well treated in SCIENTIFIC AMERICAN SUPPLEMENT 1508.

EPICYCLIC TRAINS, which play an important part in toothed gearing, are ably described in SCIENTIFIC AMERICAN SUPPLEMENT 1524.

Each number of the Scientific American Supplement costs 10 cents by mail.

PARIS GARTERS

Copyrighted 1909 by A. Stein & Co.

No Metal can touch you

You need them especially with Knee-Drawers.

The only garters that fit so perfectly you wear them unconsciously

25 and 50 cents at dealers, or direct if you don't find them

A. Stein & Co., 182 Center Ave., Chicago

SEALED PROPOSALS.

SEALED PROPOSALS will be received at the office of the Director of the Census, Washington, D. C., until 2 o'clock, P. M., August 9, 1909, and then publicly opened for furnishing all the labor, materials and work necessary for the construction in lots of 60, 75, 100, or 125 tabulating machines and delivering the same complete, free of all charges for transportation, at the Census Building, Washington, D. C. The right is reserved to accept or reject any or all bids in whole or part, to strike out any item or items in the specifications, and to waive any defects. For specifications blue print drawings, blank proposals, and full information address E. DANA DURAND Director of the Census, Department of Commerce and Labor Washington, D. C.

CARD PUNCHING MACHINES; POSTPONEMENT OF OPENING OF BIDS.—The time for the opening of bids for furnishing all the labor, materials and work necessary for the construction in lots of 100, 150, 200, 250 or 300 Automatic Card Punching Machines and delivering the same complete, free of charge for transportation, at the Census Building, Washington, D. C. is hereby extended from July 16, 1909, the date previously advertised, to July 26, 1909. Bids will be received at the office of the Director of the Census, Washington D. C. until 2 o'clock, P. M., on that date. For further information, specifications, blue print drawings, blank proposals, and full information address E. DANA DURAND, Director of the Census, Department of Commerce and Labor Washington D. C.

WANTED—DRAFTSMAN FOR DESIGN OF HEATING SYSTEMS at $6.16 per diem. Bureau of Yards and Docks, Navy Department. An examination will be held at the Navy Yard, Washington, D. C. July 30, 1909, to fill the above position. For application and further information address "COMMANDANT" Navy Yard, Washington, D. C.

ELECTRIC LAUNCH MOTOR.—THE design in this paper is for a motor of unusual simplicity of construction, which can easily be built by an amateur of small means. It is intended for a boat of about 24 feet over all and 4 feet 8 inches beam, drawing 18 inches, and is capable of propelling such craft at a speed of 7 miles per hour. Illustrated with 11 cuts. See SCIENTIFIC AMERICAN SUPPLEMENT, No. 1202. Price 10 cents by mail, from this office, and from all newsdealers.

Pennsylvania Railroad

BULLETIN

908 Miles in 1080 Minutes

The "Pennsylvania Special" is the climax of development in railroad transportation. It is operated primarily in behalf of the busy man Under the train is the finest roadbed. Above the rails is the most completely equipped train On the train is a picked crew Alongside the tracks is the best Signal System. This combination makes for speed, regularity, safety, and utter comfort.

The "Pennsylvania Special" has made good for many years. It is an asset to the business man. He can recreate on it or work as humor or necessity dictates, but he is using the minimum of time in meeting his engagements.

Three quarters of the circumference of the clock-dial, all in the off hours, is its daily deed

The "Pennsylvania Special," the pioneer 18-hour train between New York and Chicago, leaves New York every day at 3 55 P M and arrives in Chicago 8 55 A M Returning it leaves Chicago 2 45 P M. and arrives in New York 9 45 A. M

Our co-operative department will give you more choice salable property to handle than any other institution A Commercial Law Course FREE. Write for 62-page book free. THE CROSS COMPANY, 2153 Reaper Block Chicago

As strong as a solid wheel **No solid wheel is speedier**

For safety your boat must have a reverse gear or reversing propeller Cheap gears are worthless. Good ones cost like blazes and a good gear is not as strong nor as desirable as a "Sintz" Reversing Propeller and the "Sintz" costs less money. For safety try strong but little power. In the "Sintz" Reversing Propeller is combined perfect control over both speed and direction; adjustable pitch. Illustration of grease, dirt, wasted space and power. We are dead certain that the "Sintz" is the king of all reversing devices—that it will satisfy you. We'll back up that statement by refunding purchase price on any "Sintz" which that fails to satisfy, paying freight both ways. We want you to have our catalog. It contains the whole proposition in concise form. Send today.

Wilsworth & Herman Co., 814 Canal St Grand Rapids, Mich.

ROTARY PUMPS AND ENGINES Their Origin and Development.—An important series of papers giving a historical resume of the rotary pump and engine from 1588 and illustrated with clear drawings showing the construction of various forms of pumps and engines. 38 illustrations. NEW PAPERS ON

Concrete, Reinforced Concrete, and Concrete Building Blocks

SCIENTIFIC AMERICAN SUPPLEMENT 1543 contains an article on Concrete by Brysson Cunningham The article clearly describes the proper composition and mixture of concrete and gives the results of elaborate tests

SCIENTIFIC AMERICAN SUPPLEMENT 1538 gives the proportion of gravel and sand to be used in concrete

SCIENTIFIC AMERICAN SUPPLEMENTS 1567 1568 1569 1570 and 1571 contain an elaborate discussion by Lieut Henry J Jones of the various systems of reinforcing concrete concrete construction and their applications These articles constitute a splendid text book on the subject of reinforced concrete Nothing better has been published

SCIENTIFIC AMERICAN SUPPLEMENT 997 contains an article by Spencer Newberry in which practical notes on the proper preparation of concrete are given

SCIENTIFIC AMERICAN SUPPLEMENTS 1568 and 1569 present a helpful account of the making of concrete blocks by Spencer Newberry

SCIENTIFIC AMERICAN SUPPLEMENT 1534 gives a critical review of the engineering value of reinforced concrete

SCIENTIFIC AMERICAN SUPPLEMENTS 1547 and 1548 give a resumé in which the various systems of reinforced concrete construction are discussed and illustrated

SCIENTIFIC AMERICAN SUPPLEMENTS 1564 and 1565 contain an article by Lewis A Hicks, in which the merits and defects of reinforced concrete are analyzed

SCIENTIFIC AMERICAN SUPPLEMENT 1551 contains the principles of reinforced concrete with some practical illustrations by Walter Loring Webb

SCIENTIFIC AMERICAN SUPPLEMENT 1573 contains an article by Louis H Gibson on the principles of success in concrete block manufacture, illustrated.

SCIENTIFIC AMERICAN SUPPLEMENT 1574 discusses steel for reinforced concrete

SCIENTIFIC AMERICAN SUPPLEMENTS 1575 1576 and 1577 contain a paper by Philip L Wormley Jr on cement mortar and concrete their preparation and use for farm purposes The paper exhaustively discusses the making of mortar and concrete depositing of concrete facing concrete wood forms concrete sidewalks details of construction of reinforced concrete posts etc

SCIENTIFIC AMERICAN SUPPLEMENT 1586 contains a review of concrete mixing machinery by William L Larkin

SCIENTIFIC AMERICAN SUPPLEMENT 1583 gives valuable suggestions on the selection of Portland cement for concrete blocks.

SCIENTIFIC AMERICAN SUPPLEMENT 1581 splendidly discusses concrete aggregates. A helpful paper

SCIENTIFIC AMERICAN SUPPLEMENTS 1595 and 1596 present a thorough discussion of sand for mortar and concrete by Sanford E Thomson

SCIENTIFIC AMERICAN SUPPLEMENT 1586 contains a paper by William L Larkin on Concrete Mixing Machinery in which the leading types of mixers are discussed

SCIENTIFIC AMERICAN SUPPLEMENT 1626 publishes a practical paper by Henry H Quimby on Concrete Surfaces

SCIENTIFIC AMERICAN SUPPLEMENT 1624 tells how to select the proportions for concrete and gives helpful suggestions on the Treatment of Concrete Surfaces

SCIENTIFIC AMERICAN SUPPLEMENT 1634 discusses Forms for Concrete Construction

SCIENTIFIC AMERICAN SUPPLEMENT 1639 contains a paper by Richard K Meade on the Prevention of Freezing in Concrete by Calcium Chloride

In SCIENTIFIC AMERICAN SUPPLEMENT 1605 Mr Sanford E Thompson thoroughly discusses the proportioning of Concrete

SCIENTIFIC AMERICAN SUPPLEMENT 1578 tells why some fail in the Concrete Block business.

SCIENTIFIC AMERICAN SUPPLEMENT 1608 contains a discriminating paper by Ross F Tucker on the Progress and Logical Design of Reinforced Concrete

Each number of the Supplement costs 10 cents. A set of papers containing all the articles above mentioned will be mailed for $3 40

A Better Business—

THE realization of your well-made plans to make your business produce greater profits—these things are yours, and can be brought about, to a great extent, by the use of

Rapid Commercial Power Wagons

Your taxes can be reduced by the use of Rapids. They occupy less room than horses and wagons, hence less ground, in highly assessed districts, is required for their housing.

THE RAPID is Built for Business

Or they can be kept miles away from your place of business where land is cheap and taxes low.

Your pay roll can be reduced by two or three men for every Rapid installed.

One Rapid will do the work (in many cases) of three teams, three wagons and two men. See the saving.

You want to save money in your business.

You want to get the most out of it at the least cost.

Then why not look into this money saving proposition now?

Hundreds of merchants are using Rapids and are saving money thereby.

Certainly you are just as anxious to save money in your business as they are in theirs.

Catalog free; send for it to-day.

GOOD NEWS FROM PANAMA

The latest official report from Panama gives some very reassuring facts regarding the question of seepage of water through the ground in the neighborhood of the Gatun dam It will be remembered that in the controversy over this dam M Bunau Varilla and others claimed that the head of eighty five feet of water in the Gatun dam would probably produce a heavy seepage, if not through the body of the dam itself then through the underlying material of the valley bottom on which the dam was built The engineers of the canal on the other hand assert that not only will the body of the dam itself which is to be deposited hydraulically be so compact as to preclude any possibility of seepage but that the subsoil in the valley is naturally impervious or practically so to water

Partial confirmation of the engineers statements is now afforded by the conditions which have developed during the excavating of that portion of the canal which lies between the Gatun locks and the sea where one of the steam shovels has reached a depth of 32 feet below sea level The excavation in which the shovels are at work is kept dry by four 8 inch pumps, and ordinarily these pumps are not run at their full capacity When it is considered that a dike a few feet in thickness only keeps the water in the old French canal from flowing into the trench that the sea is within two miles of the excavation and furthermore, that the Mindi River flows within a few hundred yards of the ditch we are quite in agreement with the engineers that there has been surprisingly little seepage into the excavation since the work was carried below sea level ' During the latter part of June the shovel on the lowest level was obliged to suspend for a few days on account of the inability of the pumps to throw out the water that was coming in this however, proved to be only a temporary condition and the shovels were soon able to resume work It does not take an engineer to understand the significance of these facts as bearing upon the security of the Gatun dam

NAVAL ANNUALS OF 1909

The public interest in naval affairs which has been noticeably on the increase during the present decade has received a decided stimulus from the introduction of the Dreadnought type of battleship and its dramatic effect as shown in the so-called British panic over the activity of Germany in rebuilding its fleet along Dreadnought lines Hence the appearance of the two best known naval annuals, those of Brassey and Jane affords much timely information on a subject of vital importance The older annual which opens with a quotation from the speech of the First Lord of the Admiralty on the Navy Estimates made last March The safety of the empire stands above all other consideration No matter what the cost, the safety of the country must be assured" is divided into the customary four parts The first contains general articles on naval subjects of prime importance and is enlivened by some excellent half-tone engravings from wash drawings of the more notable of the latest ships built or building for the navies of the world. Part two contains Brassey's familiar list of British and foreign ships which includes the class displacement dimensions horse-power builder of ship and engine dates of launch and completion cost the position and thickness of armor on the ship the gun positions, the armament speed and coal capacity Following this are plates of the typical warships of each navy including outboard profiles and deck plans, with a summary of the principal elements of each ship given below This summary is a new departure in this year's Annual, and adds greatly to the value of the plates. Part three is devoted to articles on armor and ordnance and is followed by sets of tables, giving full details of the dimensions, velocity, energy, and penetration of every gun manufactured by the principal navies and by the leading private manufacturers of ordnance Part four, embodying the First Lord's Memorandum gives a great variety of information as to expenditures, personnel, condition of the ships, arsenals dockyards, etc

There is no more satisfactory way of conveying much information regarding a warship in a limited space than is found in a broadside photograph combined with a plan and side elevation If the latter be freely dimensioned and the group of illustrations be supplemented by a tabular description, the reader is put into possession of a *multum in parvo* of the particular ship described Jane's "Fighting Ships" is modeled on this plan, and since it contains this information regarding every ship of importance in all the navies of the world, big or little, it can be seen the work is remarkably complete Naturally, in view of the little argument between Great Britain and Germany on the subject of battleship construction, readers of the Annual will turn first to the pages dealing with the German navy Germany has been unusually successful in maintaining secrecy about her new 'Dreadnoughts,' so much so that Mr Jane in spite of all his assiduity in searching for the latest naval information has to confess that "it is not possible even now absolutely to guarantee the exact correctness of the set of plans given with this edition" He anticipates regarding them that there will very possibly be considerable discussion"

Turning, then to the plates of the new German Dreadnoughts,' we find that the Westfalen and 'Nassau (1908) are credited with ten 11 inch 50-caliber guns mounted in five turrets disposed similarly to those of the original "Dreadnought," viz., one turret forward one on either beam, and two astern This on a displacement of 17 710 tons is reasonable and probably correct We have always as our readers will doubtless recollect, considered that the crediting of these ships with fourteen and even sixteen 11 inch guns was absurd The "Posen ' and "Rheinman" (1908) are credited with carrying twelve 11-inch 50-caliber guns on a displacement of 19 000 tons. Commencing from the bow the first six guns are mounted as in the 'Dreadnought —one turret forward and one on either beam abreast of each other Aft of the superstructure are two two-gun turrets placed *en echelon*, and astern on the center line is another turret This arrangement gives a concentration of six guns ahead and astern and ten on each broadside The plans of the latest six 'Dreadnoughts of the German navy call for criticism On a displacement of 19 000 tons they are supposed to carry twelve 12 inch guns in four turrets mounted on the center line the forward and after turrets each containing three guns We think it is highly improbable that the three-gun turret will ever be found on the German ships or on those of any other navy Jane credits the Japanese with carrying fourteen 12 inch guns on their latest design six of which are carried in two three-gun turrets, one forward and one aft. There is strong objection to the three gun turret on the ground that a single 12-inch high-explosive shell penetrating such a turret would probably put three guns out of action at once. An even more serious objection is that the greater the number of guns carried upon a single turntable, the slower the rate of fire per gun, unless indeed volley firing be adopted and all three guns are loaded and fired together, a practice which would involve enormous strains upon the turntable If the guns are fired separately they must wait upon each other, since the firing of any one gun, or at any rate of either of the outer guns of the three, throws the other two guns off the target and would necessitate a re-sighting The ideal mounting for speed and accuracy would be to mount each 12-inch gun in a single turret. This, however, would involve too much turret weight and would cut down the number of guns that could be carried The armament of the German "Invincible" type of battleship cruisers is given as ten 11 inch 50-caliber guns, mounted as in the "Dreadnought," the displacement of the ship being 19,000 tons and the speed 25 knots The "Bluecher," of 14,760 tons, is armed with twelve 8 2-inch guns

Next to the German navy, perhaps that of Japan will excite the greatest interest. The two new "Dreadnoughts" which are building, and the three or four others projected, according to Jane, will carry fourteen 12-inch guns on a displacement of 20,750 tons. Since it takes 26,000 tons to carry twelve 12-inch guns in our own "Wyoming," we are at a loss to understand how the Japanese are going to carry two more guns on 5 000 tons less displacement. Either the speed must be less than the 20 knots given, or the armor plan must be considerably cut down. The Annual gives particulars of the five battleships and three cruisers captured from the Russians, or raised after the capitulation of Port Arthur The "Iwami," formerly "Orel," has not only had her superstructures and smokestacks cut down, but has been re-armed with four 12-inch and six 8-inch 45-caliber Japanese guns. The "Hizen," formerly "Retvisan," still carries her armament of four 12 inch 40-caliber and twelve 6-inch 45-caliber Russian guns. The "Suwo," formerly "Pobieda," has been re-armed with four 40-caliber 12-inch and ten 45-caliber 6-inch Japanese guns, and her efficiency is therefore considerably increased. The "Sagami," formerly 'Peresviet," has been re-armed with four 12-inch 45-caliber and ten 6-inch 45-caliber guns. The re-arming of these ships has provided the Japanese navy with four effective battleships of the pre-"Dreadnought" type

Very properly Jane has always laid great stress upon the main battery as being the principal determining factor above all others in a comparison of the fighting strength of the world's navies. On this basis he presents a table entitled "Ships Built or Building in the Principal Navies, Armed with Guns Equal or Superior to the 12-Inch 45-Caliber Gun," which is able to attack 11 inches of Krupp armor outside of 7,000 yards range. In this table the adherence for many years past of the United States to the 12-inch and 13-inch gun shows to good effect. As matters stand to-day, Japan comes first, with eleven such ships, followed by the United States with ten, Great Britain with nine, France with four and Germany with three. In 1910 and 1911 Japan will still hold the first position, with Great Britain and the United States second, France third, and Germany fourth In 1912 Great Britain will be first with twenty-two such ships, Japan second with seventeen, followed by the United States and France with sixteen each Germany with thirteen, Austria with seven, and Italy with two This forecast, however is, of course, liable to great modification due to change of programmes.

AS OTHERS SEE US.

Any communications from our readers, which throw any light upon what the subscribers desire to find in our columns, are most welcome always to the Editor, whether such letters are in the nature of commendation or criticism As a rule, the Editor is not able to determine whether certain features or departments in the paper are really appreciated by the readers, unless the friends of the paper will take the trouble to write the Editor and express their opinion or their preferences.

Occasion has arisen in the past when it was deemed desirable to make some change or eliminate some department of the paper, and the Editor has not been aware that such department may have been of the greatest interest to certain readers until a storm of protest leads to his restoring the omitted feature

The following letters were received by the Editor recently in a single mail, and by their diversity and wide geographical range were of interest to him, and may be so to some of our readers

A correspondent from Eugene, Ore, writes

"I have enjoyed reading the SCIENTIFIC AMERICAN immensely and hope to be able to continue it for years

Have a small shop and some tools and have made several things from directions given in the Handy Man's Workshop Department. Such work is, to me, great pleasure, since there is enough—without being too much or having anything omitted—in the instructions.

"I wish you unmeasured success."

The editor of a paper in Michigan writes

"Allow me to commend you enthusiastically on the fourth-dimension contest. Without taking exception to the work of the committee, I feel very strongly that Mr Cutler's paper in the issue of July 10th is most timely and valuable, as loose thinking on the part of readers, especially if it favors superstitious conclusions, is too common What the fourth dimension is not is more important to persons not mathematicians than what it is."

A large firm of manufacturers in Jeróme, Ariz., writes

We are steady subscribers to the SCIENTIFIC AMERICAN and could not get along without it."

A French correspondent in Paris writes:

"Being now a faithful subscriber, I must come and say to you that in the first place in this paper I read and use your Queries. This for two reasons First. I do not know any other piece of any other scientific paper which gives me so many truth and new ideas, in all kinds of fashion Really, I take out a great deal from them, and I cannot say how sorry I was when several weeks, some time ago, my dear Queries were absent. Second. My second reason for liking the Queries so much is the pleasure one has in looking at the idleness (*sic*) of some fellows.

"Questions such as, 'Which goes fastest, top or bottom of a wheel?' or 'Why does salt freeze in summer (to cool drinks) and melt in winter (to melt snow)?' are a real pleasure to me, exactly as when you read Tit-Bits.

"It is the most diverting part of the SCIENTIFIC AMERICAN Do not suppress it."

ENGINEERING.

The War Department exhibit at the Alaska-Yukon-Pacific Exposition contains a model exhibit of the system of protecting harbors by mines which will serve to show the people of the Pacific coast how perfectly secure against the entrance of hostile ships their harbors may be made. The terrific destruction wrought by mines in the Japanese war has rendered it certain that no captain of a costly modern battleship will jeopardize a ten-million-dollar vessel by venturing into properly mined rivers or harbors.

An important agreement has been reached between the Compressed Air Workers' Union and the employers, by which, instead of being paid in proportion to the depth to which the caissons are sunk the men will be paid according to the amount of air pressure in which they are compelled to work The pay will vary from $3.50 for a day of six hours at twenty-two pounds pressure to $4 50 a day for one hour and twenty minutes' work at from forty to forty five pounds pressure

Such rapid progress has been made on the "Florida" that she will probably undergo her trials during the next two or three months. Special interest attaches to this vessel because of the fact that she is the first of the 'Dreadnoughts' designed specifically as such for our navy, and the first of our battleships to be driven by turbine engines. The 'South Carolina" and Michigan," of 16,000 tons, although they carry a "Dreadnought" armament, were originally designed to be of the "Connecticut" type.

It was recently announced by the Public Service Commission that, with a view to avoiding the objections raised by property owners to a four-track tunnel through Lexington Avenue in this city at one level, which would involve sidewalk encroachment, plans are being drawn for a double-deck tunnel with the two local tracks immediately below the street and the two express tracks immediately below the local tracks. There is an objection to this scheme from an operating standpoint, due to the longer climb necessary to reach the street from the express platforms

The announcement of the White Star Line that their ships engaged in the Liverpool service will call at Holyhead on both the eastbound and westward voyages has been followed by a persistent rumor that the Cunard Company's ships when running westward will call at Fishguard on the southwest coast of Wales to pick up the late mails from London These arrangements would result in a saving of several hours time, and in the case of the Mauretania and "Lusitania,' it would then become possible for passengers to be landed in New York on Thursday night

The launch of the replica of Fulton's "Clermont" and the arrival in New York of the reproduction of Henry Hudson's 'Half Moon,' remind us of the near approach of the Hudson Fulton celebration in New York city The 'Clermont," which was built at the Staten Island Shipbuilding Company's yards, was christened by Mrs. Arthur Taylor Sutcliffe, great granddaughter of Robert Fulton. The Half Moon," although a three-masted vessel, is but 66 feet in length. She was shipped entire on the deck of the Holland American liner "Soestdyk"

A solution of the problem of navigating streams in which shallow and deep water are alternately encountered is suggested by Mr C J Bartlett of New Orleans. He proposes the construction of a submerging ship, which is designed to carry two barges when in deep water, and on encountering shallow water will submerge, float the two barges free, and tow them through the shallower reaches. Each barge is of 1,500 tons capacity and their loaded draft is eight feet. The loaded draft of the ship is fifteen feet and in the light condition she would draw six feet.

The mere mass of the concrete floor and side walls of the locks at Gatun will be sufficient to give them great stability, but, with a view to adding a further safeguard against rupture in the event, say, of earthquake shock, the government engineers intend to reinforce the concrete by imbedding in it no less than seven thousand tons of old rail This metal consists partly of a light rail which was used during the era of French construction, and partly of more modern American rails, which have been so badly bent that they can no longer be used in the track.

The rise of Germany in the field of yachting is as remarkable in its way as the wonderful development of her merchant marine. A few years ago yachting as a sport was practically unknown in that country To-day, thanks mainly to the example and untiring efforts of the German Emperor, Germany possesses one of the finest fleets of large yachts in the world The two latest and finest of these, the "Germania" and the Emperor's new schooner built this year, are probably the two fastest vessels of their class afloat. Commenting on these facts the Yachtsman, of London, says the result of this activity has been that Germany is actually a more important yachting nation than Great Britain.

ELECTRICITY.

An electric glue heater has been put upon the market which is claimed to melt glue in thirty minutes, and to keep it at a temperature of 150 deg. for several hours after the current has been switched off.

A hydro-electric power station is projected near Wadesboro, N C., on the Rocky River, capable of producing, with the initial installation planned, 6,000 to 7,000 horse-power The site is within a mile of the new Southbound Railway and a new town is expected to be developed by the industrial facilities

A successful electric lawn mower taking power from any convenient source by means of a flexible cable, has been invented by Mr F. H Kerr of Chicago He is building an improved type of machine capable of operating plows, harrows, drills and seeders for gardens and small farms.

The largest switchboard in the world is to be installed in the New York terminal of the Pennsylvania Railroad All the switches of the terminal are to be electrically controlled from this board Work has just been started on the switchboard It is to cost $500,000

Several towns in Ohio are electric-lighted by companies which own and operate no power station, but purchase current from some central station in the district. Instead of risking the building and equipment of a power station which may not be sufficiently patronized to be profitable or waiting for the central station to reach out for the business of small country towns, companies are formed in the latter owning their own wires and buying power

A steam-driven power plant is being built at Galena Ill to transmit power 25 miles north into Wisconsin The first two units installed will be 1 500 and 1,250 kilowatt three-phase alternating-current generators driven by reciprocating Corliss engines. The current is generated at 2,300 volts, transformed to a line potential of 33 000 and reduced again to 2 300 or lower where necessary for local distribution This plant will supply among other places the zinc mining center at Hazel Green

One of the largest electric organs ever built in the United States is about to be erected in the Auditorium at Atlanta, Ga. It will be played from a movable four manual control 65 foot away by an 8 volt current from a specially wound generator and blown by a 20 horsepower motor direct connected to a series of fans raising the air pressure by steps either a pressure of 10 15, or 50 inches water column being available in the universal wind chest A smaller echo organ is placed at the opposite end of the auditorium which can be played either simultaneously or independently

In addition to the Pennsylvania Railroad which began to send its passengers through the Hudson tunnels on July 19th the Erie Railroad will make use of the same facilities beginning on August 2nd The schedule for the regular operation of trains calls for six minutes for the trip to Manhattan from Jersey City The six minute schedule will chop off about 15 minutes of the time it now takes the commuter to get from Jersey City to Church and Fulton Streets in New York Arrangements have as yet not been made for the use of the tunnels by the passengers of the Delaware Lackawanna & Western or the Lehigh Valley roads

Although the operation of "pay as you-enter" cars in New York has been so successful and popular as to promise the introduction of many more this will not require the 'scrapping' of hundreds of serviceable cars of older patterns The Third Avenue line has had in operation for about a month a double-truck car converted to prepayment service by the lengthening of the platforms New hoods and knee braces were required but the old vestibules have been retained. The only difference from the new cars is the absence of a division between entry and exit doors, a double sliding door extending the whole width of the car and entry being divided from exit only by the vestibule rail. The operation of the adapted car has been so satisfactory that it is proposed to reconstruct 200 more in this way

Experiments have been made in Italy to discover the best form of insulator for high-tension transmission lines which run near the sea. It is found that in the vicinity of the sea a thick layer of salt accumulates on the insulator, and serves as a conductor to cause leakage of the current to ground. The Italian experimenters have discovered that the incrustation forms chiefly on parts which are not protected from the wind and rain The ordinary insulator for high-tension purposes consists of a number of petticoats or bells, in which the salt accumulates to a considerable depth For this reason it was found best to provide an insulator with an almost flat bell which would be so exposed to the weather that the crust could not form to any harmful extent. Insulators of this type were used with perfect success over a period of eighteen months on a 25 000-volt line. Under tests in the laboratory they withstood 75,000 volts dry, and 30,000 in a heavy rain.

SCIENCE.

The teaching of cooking is a science in Germany, as is everything else in that Teutonic empire. Traveling cooking schools are now sent about, for the purpose of instructing peasants how to cook cheaply and well. Since country people cannot go to school the government will send schools to them These traveling kitchens are now established in Hesse Nassau Franconia and the Palatinate as well as in Bavaria

Metchnikoff, in The Prolongation of Human Life,' blames the lower intestine for most human diseases, and consequently for our early death Dr Distaso of Paris not only agrees with him but even advocates the entire removal of the large intestine in childhood in order to ward off old age as long as possible Distaso claims to have confirmed Metchnikoff's statements that the large intestine is the breeding place of most harmful germs.

Some idea of the general use of false teeth may be gathered from the statement that 20 000 000 of them are exported from America to England every year When we consider that probably not more than half the inhabitants of Great Britain indulge in the luxury of false teeth no matter how many grinders they may have lost these figures would seem to indicate that nearly everyone in England suffers from defective or missing teeth As far as observation goes the United States is no better off than England in this respect

The Academy of Sciences of France has awarded a prize of $140 to Prof E W Brown of Yale University for his researches relating to the theory of the moon The sum of $200 has been awarded to Lieuts Jaence and Colin for their improved wireless telephone Out of the sum of $20 000 settled upon the Institute by Prince Roland Bonaparte the sum of $800 has been set by for the encouragement of researches by Prof Cayeux of the School of Mines University of Paris, for the particular object of enabling Prof Cayeux to proceed to the United States and continue his remarkable researches with reference to deposits of ancient minerals

Prof. W P Bowen of the Michigan State Normal College presents a most helpful exposition of what constitutes fatigue in Hygiene and Physical Education and what counterfeits it Some people are evidently simply born tired There is much misinformation as to what fatigue is It is not simply a feeling of uneasiness' and discomfort There is a motor as well as a sensory side which is even more important Some of the counterfeits of fatigue are drowsiness weakness and discomfort from breathing bad air, aversion to work termed *ennui* by the French *Müdigkeit* by the Germans lack of suitable food loss of sleep faulty nutrition indigestion adenoids and the early stages of many diseases One of the commonest forms of fatigue in children arises from the suppression of natural activities by the maintenance of one position for long periods

As a result of archæological studies pursued during many years J Prestel claims to have discovered the essence of the method employed in the manufacture of ancient Roman pottery (*terra sigillata*) and its homogeneous glaze According to Herr Prestel the secret lies not in the chemical composition of the paste but in the treatment applied to it and to the colored glaze The clay was prepared by aging followed by washing kneading and stamping Before firing the ware was exposed to the sun and air but sheltered from rain until it appeared quite dry The frequent changes of temperature and humidity and the alternation of sunlight and darkness which occurred during this slow process of drying insured uniform shrinkage in firing and durability of the finished ware When a glaze was used it was applied to the moist ware immediately after the latter was shaped so that the glaze became intimately united with the body of the ware during the slow drying process. Firing then produced a brilliant gloss and imperishable colors

Dr L. A. Bauer has raised the question whether magnetization alters mass His observations were made upon bar magnets in both the magnetized and demagnetized states and in various orientations with respect to the earth's field It is obvious that if there be local disturbances of the field the weighings may give different results for different positions of the magnet since it is not simply the force of gravitation which is being measured, but in addition the magnetic forces which act upon the bar Experiments conducted by Dr Morton G Lloyd seem to indicate that magnetization to a flux density of 17500 gausses does not alter the true weight of the specimen by as much as one part in 15 000 000, certainly not as much as one part in 8 000 000 If we make the usual assumption that mass is proportional to weight we may say that within the same limits the mass is not altered Since in Dr Bauer's experiments the flux density was probably not in excess of 3,500 gausses and since the difference found by him amounted to more than one part in 1 000 000 it is necessary to conclude that these differences are due to other agencies.

BASEBALL AT NIGHT.

The experiment of playing baseball by night was successfully made recently in Cincinnati As may be supposed powerful searchlights were employed to illuminate the baseball field The Cincinnati National League Baseball Park, where the first game was played was encircled with 100-foot steel towers, each carrying two extremely powerful carbon lamps capable of illuminating the entire park Every corner of the field was brightly illuminated

Although we have been unable to obtain engineering data on the construction of the lamps we are informed that the carbons alone are 1¼ inches in diameter Three lamps were found almost sufficient to illuminate the park but to make the undertaking absolutely successful fourteen lamps were employed to cast their rays upon the grounds Three-phase current was supplied by a 250-horse-power 60-cycle dynamo having a speed of 345 revolutions per minute The voltage is 235 The amount of current generated was enough to run twice the number of lamps for which reason huge rheostats are employed to take care of the excess Two of these powerful lamps are mounted behind each fielder Others cast their rays from the roof of the grand stand and the covered bleachers The inventor of the lamps is George F Cahill who has taken a great interest in what may be termed the mechanical improvement of baseball playing He is the inventor of an ingenious baseball pitching machine which has been used with success

ONE OF THE POWERFUL PROJECTORS.

* * *

The Collateral Value of Sanatoria.

BY JOHN B HUBER A M M D

Bodington began in Sutton Coldfield England an institution for the treatment of consumption on principles natural rational and successful He insisted on generous diet fresh air day and night, the air within the house was to be as pure as that without nor could it ever be too cold for a consumptive patient Here then was established in 1840 probably the first tuberculosis sanatorium in the modern sense Its fate? Bodington was regarded as a lunatic he was contemptuously opposed by many a colleague, his patients were driven from his institution, which he thereupon turned into an asylum for the insane, in which we now believe many of his neighbors might fittingly have found an abiding place

Next in the history of santoria comes Brehmer who, having been attracted by the ideas of that obscure country doctor in England determined with true Teutonic stubbornness upon making them enduringly effective Like Bodington Brehmer had to endure the lot which so frequently falls to genius and altruism he also met with much opposition and ridicule but he persisted until he convinced both his profession and the laity of the soundness of the methods he elaborated The result is the institution established at Goerbersdorf in Prussian Silesia which has from small beginnings become of world wide beneficence and influence It is due to Brehmer's grit that we have now tuberculosis sanatoria over all the civilized world

Since this inception of the work the building of sanatoria has oftentimes, though not always been accomplished despite opposition virulent and most discouraging to those who would believe that our race has really advanced in human emotions Yet demonstrably the properly conducted sanatorium can hurt *no one* on the contrary it is beneficent from every conceivable viewpoint A great deal of phthisiophobia'—from which arises opposition to sanatoria—is based upon ignorance of the nature of infection in tuberculosis Such infection is not air-borne as in scarlet fever or measles Practically speaking, it is conveyed from the consumptive to his fellow human beings only through the sputum. And when this sputum is properly disposed of there is no danger of tuberculous infection. With regard to the danger of infection to the community in which a sanatorium is placed we have but to cite the experiments made at Saranac Lake, where Trudeau established the first American institution upon the modern principles of phthisiotherapy All the dust in a room of one of the cottages occupied by consumptives was gathered and a culture made from this dust was when injected insufficient to cause tuberculosis in a little guinea pig A scientifically ordered sanatorium rather than a menace to any community, is on the contrary a decided influence making in it for healthful living in every possible meaning of the term Its neighbors learn to spit less to keep their windows open day and night to live the hygienic life generally The tuberculosis sanatorium has invariably raised local health standards

BASEBALL AT NIGHT.

In the sanatorium the consumptive gets well under circumstances the best for all concerned While there he does not infect his family, his fellow workmen, and his community, when he leaves he goes forth as a missionary disseminating the precepts of sanitation and prophylaxis he has imbibed The only trouble is, there are not and probably never will be enough of these institutions to accommodate all the sufferers from this disease, as it is now, only about five per cent can be treated in sanatoria The rest must get well—and it is quite possible for them—in their own homes.

In the merely commercial sense the sanatorium is a factor decidedly not to be ignored The rural citizen may begin with fighting its establishment in his vicinity, but give him a little time, and he will probably reason as follows The sanatorium patients are treated in such manner that so many dozen eggs are required for it every day, also so many hundred quarts of milk, so many pounds of butter, so much cereals, meats in proportion. And where or how could the sanatorium managers get these staples better than from the farmer folk in the neighborhood? If now it is explained to him that the prosperity, for example of Goerbersdorf has trebled, as has also its population, since the beginning of Brehmer's work, the ruralite will probably begin to "sense" the wherefore of this, then, no doubt, he will throw away the stick he has been whittling, shut up his jackknife and conclude that, for his part, the building of the contemplated institution need not be delayed

In point of fact, rather than being detrimental, the sanatorium actually causes real estate values in its locality to rise. The National Association for the Study and Prevention of Tuberculosis has gathered from twenty two States, covering every section of our country, convincing data to this effect The Survey (June 19 1909) has summarized these reports Over 67 per cent of the sanatoria have exerted a favorable influence on surrounding property, and in almost as many cases their effect in raising assessable valuations has been direct and measurable. In most of the other instances no differences were observable, in only three localities was it claimed that residents had been repelled In the neighborhood of a sanatorium at Portland, Ore, land has more than doubled in value in three years, the greater demand being close to the institution At Aiken S C land in the vicinity of the sanatorium has quadrupled in value since it was built, at Asheville, N C, vacant lots near one of the sanatoria sell at four times their price in 1900, and others farther from the institution but nearer the city, are less valuable, in Hebron Me the advance has been 30 per cent. Like results are reported from Luzerne, Pa. Liberty and Saranac Lake N Y Pittsford, Vt, Mt Vernon, Mo and Silver City, N M

In these places the sanatoria form an important part of local business and it would hardly be fair perhaps to make them criteria, nevertheless the effects on values are the same in the big cities—New York, St. Louis, Philadelphia, Brooklyn, Boston Pittsburg Not a single instance was reported where the presence of a santorium camp, or dispensary in a large city has had a detrimental effect on the value of nearby property And the courts of Massachusetts, North Carolina, and Virginia have decided that a tuberculosis sanatorium is not a menace to the health of a community, or to the property in its vicinity

Finally, the fact that any given locality is selected as desirable for the establishment of a sanatorium in it makes for a guarantee and an advertisement that it is a salubrious region, health resorts get built around it, private cottages are erected Would the Adirondacks, for example, have become so extensive and profitable a summering place had its destinies not been shaped in Saranac Lake?

Electric freight locomotives have been ordered by the New York, New Haven & Hartford Railroad for trial on its main line.

THE FIRST ATTEMPT AT A CROSS-CHANNEL FLIGHT AND NEW FRENCH CROSS-COUNTRY RECORDS.

After meeting with so much success in flying over *terra firma*, it is little wonder that some of the leading French aviators wished to attempt to fly across the English Channel—a distance of but 21 miles—to England, in view of the prizes, amounting to $7,500, that have been offered for this feat.

Hubert Latham, the successful driver of the "Antoinette IV" monoplane, after elaborate preparations, attempted the trip early in the A. M of July 19th, and our frontispiece this week shows him leaving the cliff at Sangatte (near Calais) and also flying above the Channel Unfortunately the motor stopped after the monoplane had been in flight about eight minutes, and the machine came down in the sea. As the water was not rough, and as the built up wings of the monoplane were air tight and covered with water proof material the machine floated gently upon the waves until picked up by the French torpedo boat destroyer 'Harpon," which had been sent out ahead for this purpose Latham was found at ease in his seat, smoking a cigarette The monoplane was somewhat damaged in getting it aboard the destroyer, but as soon as it was brought ashore arrangements were made to repair it, and Latham stated that he would try again on the 23rd instant. M Louis Bleriot, whose cross-country monoplane record of 33 miles we reported in our last issue shipped his machine to Calais with the intention of making an attempt before Latham could get his machine repaired but owing to bad weather he was unable to do so Count de Lambert is also about to try to cross with a Wright aeroplane On the same day M Paulham with a Voisin biplane fitted with a Gnome revolving-cylinder motor, made a flight from Arras to Douai a distance of 20 kilometers (12¼ miles) in 22 minutes or at an average speed of 37 2 miles an hour The day before he beat Wilbur Wright's 360 feet height record by rising to a height of 450 feet

On July 23rd Henry Farman with his new biplane, made the longest cross-country flight thus far recorded Starting from the parade grounds at Chalons he flew to Suippes covering about 40 miles in 1 hour and 5 minutes and keeping at an average height of about 150 feet throughout the trip This flight demonstrates without question that the aeroplane as a means of transportation of individuals has now to be reckoned with Both a biplane and a monoplane have lately flown with three people aboard On a machine of the former type M Gobron carried Mme Collieux and Mr d Almeida for five minutes on July 3rd at Chalons while M Bleriot took M Fournier and Santos-Dumont on a 1 000-foot flight last month at Issy Thus it is mainly the question of a reliable aeronautic motor *that is keeping the aeroplane from being put into* immediate use both as a vehicle of sport and transport

◆

Orville Wright's Flights at Fort Myer.

After a week of failure to make a successful flight, as reported in our last issue, Orville Wright finally got in the air again and made a 16 53-minute flight on Saturday afternoon, July 17th The following Monday, the day that Latham attempted to fly across the channel, Mr Wright made two excellent flights of 25 and 30 minutes duration, making 25½ and 29½ circuits of the parade ground at Fort Myer, respectively The machine made large and small circles and sometimes passed beyond the borders of the parade ground It flew at an average height of about 75 feet. On July 20th Orville Wright beat his last year's record of 1 hour and 14 minutes by remaining aloft 1 hour, 20 minutes, 45 seconds. During this flight he made exceedingly sharp turns and rose to a height of 150 feet at times. His perfect control of the machine was apparent to all The next day, after replacing the 10-tooth sprockets on the engine with 9-tooth sprockets and thereby increasing the speed of the motor from 1,200 to 1,400 R. P M., two short flights of 3 and 11 minutes were made.

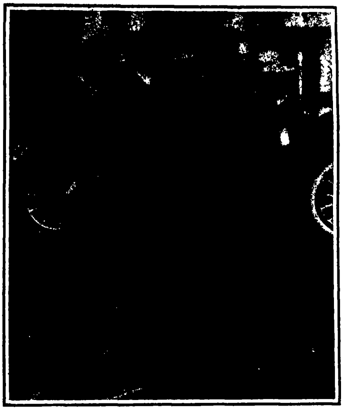
The Greatest Wireless Station.

The United States navy is to have the greatest wireless system in the world Some little time ago it placed with a Pittsburg firm a contract for the machinery necessary to generate sufficient power to send wireless messages three thousand miles The machinery is now all ready for installation but as yet there is no place to install it nor a tower high enough on which to place the equipment for sending messages so great a distance. It was suggested by one of the officials of the Navy Department that the Washington Monument be used for the purpose but the proposition was met with such a storm of protest from the public, that the idea was quickly abandoned And now the government is to build a special tower for the purpose

This tower will have a base of fifty feet in diameter tapering to eight feet at the top at which point it will be just six hundred feet from the ground level When completed it will be in a class all by itself no other wireless station ever having been built to such proportions. This tall chimney like structure will be built of steel and concrete On account of the recent development of the efficiency of concrete it was decided to use this character of material The tower, of course, will be at Washington and it will be located in Rock Creek Park and the top will be reached by a spiral stairway

The whole scheme for building this gigantic wireless station was brought about through the Navy Department because of its desire to reach its ships at sea. The machinery for operating the station is guaranteed to deliver to all instruments keyed to receive it within a radius of 3 000 miles To-day wireless can be depended on to reach no farther than 1 000 miles and the delivery even at this distance is uncertain

The cost of the installation of the new station will be $800,000



Hubert Latham, aviator, and M Levavasseur, designer and builder of the "Antoinette" monoplane and motor

M Latham holds the monoplane record of 1 hour 7 minutes in flight, while M Levavasseur is the designer and constructor of the machine and its 8-cylinder V type water-cooled motor

Latham's "Antoinette IV" monoplane being wheeled out to the cliff for the start.

THE "ANTOINETTE" MONOPLANE, ITS BUILDER, AND OPERATOR.

A New Domestic Yeast Formula.

BY CHARLES CAMTADORO.

Statistics tell us that 84 per cent of our loaves are baked at home but 16 per cent being credited up to the commercial bakery

Every woman and baker as well has a way of her or his own of making bread As to yeast no two women as a rule, agree The sour lump of dough from the previous baking leaven is frequently used and such was the yeast brought to Plymouth Rock by the Mayflower Pilgrims Undoubtedly in New England bread in some cases is made to-day from leaven handed down from successive doughs an unbroken line of descent from the first baking at Plymouth French bread is always made from this sour dough saved out from the previous baking Yeast compressed or dried is rarely if ever used in the making of genuine French bread When bakings take place but once a week the leaven is apt to be very sour and impart an acidity to the bread not over pleasant

Housewives brew their own yeast using hops, malt, etc as do the bakers in some instances

Yeast and boiled potatoes sugar etc are brewed together and the liquid stored away and used as wanted a fresh renewal of potatoes, etc being made to the old stock Yeast of this kind is carried along year after year, and when moving from State to State *the housewife guards her yeast jar* as she would gold

The compressed yeast cake and the dry yeast cakes have come in to lessen the yeast troubles not only of the housewife but the baker as well

Here is a domestic yeast formula that seems to surpass in reliability even the manufactured products

3 tablespoonfuls Durum wheat flour
1 teaspoonful malt extract
¼ dry yeast cake or ⅛ compressed yeast cake

Pour one teacupful of boiling water upon the flour and stir Cool to 120 deg F Add the malt extract and yeast and beat for one minute with a rotary egg beater Cover bowl put in warm place throughout the day and use at bread setting time at night

It should not take three minutes to prepare the above yeast The malt extract made by a hundred different manufacturers is in common use by all first class bake-shops and can be procured for 25 cents more or less per pint Here is the philosophy of this yeast For yeast to grow it must have air or sugar to feed and thrive upon and a warm environment preferably 80 to 90 deg F

The scalding hot water turns the raw into gelatinized starch The diastase in the malt extract inverts the starch into grape sugar and this sugar coupled with the air beaten into the dough mass by the egg beater supplies sugar and air for the yeast cells to *feed upon thrive and multiply*

The bowl of yeast is one mass of lively fermentation by evening and proves to be a yeast mixture simple economical and absolutely reliable

A paper on 'Inductance and Resistance in Telephonic Circuits was read by Dr J W Nicholson at a recent meeting of the Physical Society A general formula for the effective inductance of a circuit consisting of two long parallel wires has been given by the author and is suitable for cases in which the current distribution in either wire is greatly affected by the frequency of alternation In the present paper certain important cases are examined in detail and formulæ are obtained capable of immediate use A calculation of the effective resistance is also made in each case Attention has been mainly directed to that of the simple telephone circuit in which the leads are not twisted round each other in order to annul the inductive effects of the earth and of neighboring circuits Throughout the investigation only iron and copper wires as the two extreme cases are considered The large permeability of iron completely changes the character of the effect of frequency on its self induction To all metals greatly used in practice except iron the formulæ developed for copper wires may be applied

Liquid Crystals.

BY PROF OTTO LEHMANN

The treatises on crystallography define a crystal as a solid homogeneous, anisotropic body Living organisms have curved forms, while crystals are polyhedra bounded by plane faces Organisms are soft, and the simplest organisms such as amœbæ are liquid, while crystals are rigid Curved and liquid crystals would contradict the fundamental definition of a crystal, and also the theory of molecular arrangement adopted by all crystallographers Snow and ice crystals, and other crystallites are apparently curved in form or structure Hence it was considered necessary to regard them as aggregates of very small crystals (globulites) But the author's experiments first published in 1876 prove that the form and structure of some of these crystallites are certainly curved at every point and represent states of transition to homogeneous crystals

Hence physical homogeneity must be eliminated from the definition of a crystal

Polymorphous transformation which was formerly explained as a rearrangement of the molecules must be regarded in view of the writer's discovery of the temperature of transformation as a change in the molecules themselves According to these researches, molecules of a single kind can assume only a single arrangement they cannot even form a structureless or amorphous mass or a liquid or gas Amorphous solids produced by cooling below the fusing point or by supersaturation of solutions are always mixtures of unlike molecules and for this reason they cannot grow as crystals do Amorphous solid bodies are not phases

It was formerly believed that all the molecules of a crystal are alike that a crystal is necessarily chemically homogeneous But this view has been disproved by the writer's discovery of mixed crystals and of their transition to crystalline aggregates and curved crystals

Hence chemical homogeneity must also be eliminated from the definition and a crystal may now be defined as a solid continuous phase which is anisotropic with respect to at least one property growth, for example

The necessity of retaining the adjective "solid" appears to be proved by the polyhedral form apparently maintained in opposition to the forces of elasticity and surface tension but doubt is awakened by the writer's observations on silver iodide and especially by his experiments with crystals of ammonium oleate which when suspended in the solution flow and bend round air bubbles as if they were merely doubly refracting portions of the liquid Two of these crystals melt together like two liquid drops

The directions of extinction always correspond to the axes of the molecules for no casts or fragments are formed The molecules tend to assume the parallel arrangement (spontaneous homeotropy) but complete parallelism is prevented by the formation of twin crystals and by the walls of the containing vessel Hence an apparently crystalline fluid of this character is usually composed of many individual parts and is consequently turbid For this reason it has been confounded with emulsions but the latter do not form polyhedra or exhibit dichroism or double refraction

When the polyhedral form of apparently liquid crystals is disturbed it is immediately restored by an automatic extension The "force of configuration" which thus acts cannot be elasticity but must result from the tendency to expand which is due to the movement of the molecules The expansion is anisotropic because the molecules are anisotropic The anisotropy of the molecules is shown also by their parallelism to the line of flow (forced homeotropy) when the mass is mechanically deformed and by their arranging themselves perpendicular to two panes of glass between which the mass is pressed or even to one pane of glass to which a thin layer adheres (pseudo-isotropy)

Hence the word solid must be eliminated from the definition for there are really liquid crystals

Liquid crystals of two sorts can diffuse into each other and form mixed crystals This result is caused not by osmotic pressure alone but also by the attracting and directing forces acting between the molecules

There are also liquid crystals which are destitute of force of configuration and consequently present themselves as perfectly spherical freely suspended drops, but reveal their internal structure by peculiar filaments dichroism and double refraction These crystal drops are crystals which are not physically homogeneous but the directive force of the molecules of solid crystals in contact with the fluid crystalline mass may cause the formation of extended homogeneous liquid crystals which can be shown by the ordinary optical methods to belong to recognized crystalline systems

The structure of crystal drops can be twisted by adding various substances These twisted drops rotate when suspended freely in a liquid which is warmer below than above Some of them produce an exceedingly great rotation of the plane of polarization Others are pseudoisotropic or are composed of very numerous discrete lamellæ of equal thickness.

It is possible to produce an indefinite number of forms intermediate between solid crystals and crystal drops, as fluid as water

Hence a crystal must be defined as a continuous phase, which is anisotropic with respect to at least one property

It is even possible for two fluid crystalline modifications of the same substance to exist, separately or mixed in proportions which vary with the temperature The two kinds of molecules are then in a sort of chemical equilibrium similar to that of dissociation Their proportions can often be recognized by the magnificent colors which are seen by reflected light or between crossed Nicol's prisms These colors have not yet been completely explained

On contact with air bubbles or drops of isotropic liquids of higher surface tension liquid crystals may spread over the surface of separation like ordinary liquids In this case the optic axes of the molecules arrange themselves normally to the surface forming hollow liquid spherocrystals or the cylindrical forms called myelinic Such are the liquid crystals of the ethyl ester of para-azoxycinnamic acid which appear as if endowed with life moving and subdividing like bacteria and other low organisms Their movements are caused by the force of crystallization which, like the muscular force of animals, is able to accomplish work by the expenditure of chemical energy without loss, and without any fall of temperature The relationship between these two forces is manifested also by the fact that a homeotropy similar to that of liquid crystals is exhibited by organisms for example in the axis of growth and the polarity of the liquid protoplasm of embryonal cells If crystals and organisms are alike in their matter and their moving forces, how can the vital spirit of an organism direct its forces to the accomplishment of a specific object? In view of the facts of regeneration transplantation autodivision and conjugation it must be admitted that spirit is divisible as well as matter that bioblasts and atoms are animated and that simple spirits may combine to form a more complex and perfect spirit The atoms whose spirits are thus united are altered and no longer obey the laws of ordinary matter In this way it becomes possible to comprehend both the directive influence exerted by the vital spirit toward the accomplishment of an object and the impossibility of spontaneous generation

The directive molecular force of liquid crystals is probably produced by electrons revolving within the molecule In fact the molecules of liquid crystals behave like astatic magnetic systems freely suspended and hence they always even in the act of flowing maintain definite directions and a crystalline arrangement

In short the discovery of liquid crystals has filled an important blank in our knowledge of the states of matter and has correspondingly modified our theories of polymorphism amorphism states of aggregation, etc The state of aggregation of the molecules cannot affect the properties of matter as profoundly as is commonly supposed From the fact that substances behave as if they were composed of astatic magnetic molecular systems and are capable of converting chemical energy into work, without fall of temperature it should be possible to deduce a quantitative theory of the structure of matter and the mechanics of atoms which will promote the advancement of physics crystallography chemistry biology and the technical arts —Translated for the SCIENTIFIC AMERICAN from Revue Génerale de Chimie Pure et Appliqué

The Current Supplement.

Much work has been done recently on the economical combustion of coal and it is possible that the average engineer is led to believe that to secure a high economy it is necessary to get a high percentage of carbon dioxide in the flue gas Mr James E Steely, in an excellent article entitled Real Relation of CO_2 to Chimney Losses shows what theoretical combustion really is, and how erratic CO_2 can be P Altpeter writes on "Our Perception and Estimation of Areas and Distances The invention of the pantograph is historically discussed Inventions for rendering woods and textiles fireproof are described and formulæ given. The Carolina, Clinchfield & Ohio Railway which cost more than $30 000,000 to build and which involved some extremely difficult engineering work is described and illustrated at length Walter Rosenhain writes on the microscope in engineering and shows how faulty metals may be studied with its aid O Bechstein contributes an excellent article on liquefied illuminating and fuel gas Animal filters and strainers are instructively described by Dr Enoch Zander Still another interesting paleontological article is contributed by Charles F Holder the subject being "Nature's Traps." The development of algebraic symbolism from Paciuolo to Newton is briefly discussed. Some good formulæ for colored fireworks are published. The engineering, electrical, and trade notes and formulæ are given as usual

Conviction for Perjury in Patent Case.

In the U S District Court, Oregon C A. Paterson was convicted of perjury for having sworn falsely under an oath administered to him by a notary public that he was the "original, first, and sole inventor" of an improvement in buckles, for which he filed an application for a patent. The indictment was drawn under section 5392 of the revised statutes of the United States, which provides that any person who takes a false oath before an officer competent to administer oaths is guilty of perjury

So far as we are aware, this is the first criminal conviction for swearing falsely in a patent application The presiding judge, Woolverton, in his charge to the jury drove home the importance of the oath in patent applications in the following language:

Such an oath declaration, or affidavit constitutes in part the proof upon which the Commissioner of Patents acts in determining whether or not the invention claimed is new and useful and is such a one as to entitle the claimant to a patent thereon Thus it is that the claim for the patent forms the basis upon which this inquiry proceeds and the oath, declaration or affidavit subscribed in support of the application is therefore touching a matter material to the inquiry before the Commissioner of Patents, and is such a one upon which perjury may be predicated under said section 5392 if the party taking the oath or making the declaration or affidavit swore falsely with relation thereto or if at the time of taking said oath he did not believe the matter or facts set forth therein to be true

The evidence showed that the defendant Paterson had stolen the underlying idea from the true inventor Van Emon Accordingly the jury was compelled to decide as a matter of fact whether or not Paterson was the true inventor and whether or not he conceived the idea *independently*

Largest Olive Ranch in the World.

Very few eastern people comparatively know that the largest olive ranch in the world is located within 25 miles of Los Angeles Cal

This wonderful orchard situated at Sylmar is ten times larger than the biggest olive ranch in Spain There are over 120 000 olive bearing trees and they average 50 pounds of olives to the tree The Sylmar ranch consists of 12 000 acres and each acre contains 110 trees which produce 2 000 gallons of olives each season This quantity of fruit makes 250 gallons of pure olive oil—valued at $2 per gallon—thus equaling $500 per acre profit

The olive wood is highly prized by cabinet makers as it is very hard and takes a high polish The Italians consider an olive orchard as a perpetual source of wealth as the older it grows the more valuable it becomes The trees are supposed to live about 4 000 years under favorable conditions There are some olive trees now on the Mount of Olives in Palestine, which are computed to be not less than 3 000 years old

The olive industry has been growing steadily in California since its first introduction by the early Spanish mission fathers, and the olive culture in that State can never be overdone, since the olive can be produced on the American continent with any degree of success only in central and southern California, New Mexico, and Arizona

The Longest Pipe Line.

Pipe-line connections have been completed by which it is possible to pipe oil from the Oklahoma wells to New York harbor Oil has been started on the long journey of 1,500 miles This is the longest pipe line in existence in the United States, and indeed in the world It is not probable that much oil from the mid-continent district will be brought to the seaboard at present, and the completion of the line seems to be more in the nature of a provision for the future, or for emergencies which may arise Oklahoma has the most active oil field in the country at present moreover its production is increasing while that of Pennsylvania and West Virginia is decreasing It may not be long before the western wells will be called upon to supply the seaboard and export demand —American Machinist.

A correspondent in Troy, N Y, draws our attention to the fact that our mention, in a recent issue, of the New York State Barge Canal as extending from Buffalo to Albany is misleading, since the canal actually connects with the Hudson River at Troy, just above Albany The citizens of Troy are hopeful of securing the sanction of Congress for a 400 foot channel in the Hudson to their city, and hope to make extensive waterfront improvements in preparation for the completion of the canal.

A FORGOTTEN GUN.

To the Editor of the SCIENTIFIC AMERICAN

In one of the sporting magazines I read an article dealing with the various devices used in the transition from the flint to the percussion lock gun. About sixty-five years ago I saw a combination flint and percussion lock gun. While the flint lock was even at that date being superseded, many flint-lock double-barrels were in use. At a shooting match on the outskirts of Edinburgh this gun was used. In each hammer the flint was removed and a piece of bent steel was inserted so that in firing it struck the flash pan close to the vent. The detonators were made very much like the tags on shoe laces. The fulminate was placed in one end, which was closed, in the open end a few grains of powder, closed with a little pellet of wax. When loaded the detonating tags were inserted in the vents It never missed fire and really was the forerunner of the friction primer still used in many field guns. No mention of this style of gun has been made. It was superior to the old pile lock

HOW THE PEACE COULD BE KEPT INTERNATIONALLY.

To the Editor of the SCIENTIFIC AMERICAN

I have read with interest your article "To Keep the Peace" in your issue of May 29th, and I think that both you and Mr Dutton are mistaken in thinking that it would require an international army to enforce the edicts of a court The same object could be more effectually accomplished by a decree of absolute non intercourse until the offending power submitted to the decrees of the tribunal

To make my meaning clearer I will suppose that at least at the start, all the nations adhering to the tribunal have disarmed (Of course nothing could be accomplished unless all the great powers became parties to the agreement to submit their differences to the court.) Now let us suppose that a power Germany for instance, should refuse to arbitrate with France and should hastily summon such men as she could get together and invade France

In this case, both parties having disarmed France would be in at least as good a condition to defend as Germany to attack But let us suppose that the minute Germany takes this course, the tribunal issues an order of non intercourse, viz, that no mails, no telegraphic communication, no commerce no passengers shall be allowed to leave or enter Germany, in fact that no intercourse of any kind shall be held with the rest of the world Would not the citizens of Germany be the first to insist that its government should submit to the decrees of the tribunal—in fact, much more quickly than it would be forced to do so by any armed force, which would be difficult to transport to the place needed, difficult to provision and perhaps be defeated by the forces of the power it was trying to coerce? SPEED OF THE "MAURETANIA"

ENGINEER MASTERS OR MASTER ENGINEERS.

To the Editor of the SCIENTIFIC AMERICAN

As regards the relative position or authority of the master and chief engineer on shipboard to-day, as discussed in your recent issue under the caption 'Speed of the Mauretania',' let me point out that if we look at the conditions obtaining about forty-seven years ago, when the "Scotia," the last of the Cunard side-wheelers, was built, the responsibilities of the master were at least equally as onerous as those of the chief engineer. Sails were also carried in those days, and here is a well-authenticated story I often heard when a boy, that the Cunard company paid the master a bonus for every lower topsail that was fairly carried away by the wind, and old Commodore Judkins obtained this bonus several times while in charge of the "Persia," and subsequently in command of the "Scotia." But if we come to more recent times, and look at such a steamer as the Inman "City of Berlin" built by Caird in 1874, we shall see that the engineer's duties were not augmented, while the master's were, or would have been had the conditions or circumstances under which he then navigated the North Atlantic been known and realised by him. The 'City of Berlin," now the U S transport "Meade," is 488 x 44.3 x 34.9 to top of "floors." Now, from the plans I have before me, this makes her practically 37 feet molded depth. This exceeds eight-tenths of the breadth. How it is that she did not follow the "City of Glasgow" and the "City of Boston" under the exigencies of hurried loading in the North Atlantic trade is a miracle. Since becoming a United States vessel she has no doubt been carefully handled, and I may point out that no matter how deep the ship is, she can be rendered perfectly stable by judicious loading, and probably her master was aware that she was lacking "stability of form." This, however, was his burden, if he knew it.

But to return to the engine room The "Berlin" had a low pressure cylinder of 120 inches, or 10 feet, in diameter, the largest that ever floated, but the revolutions of this engine were only about 54, giving a piston speed of not over 600 feet per minute Then the auxiliaries were very few No ballast pumps, no dynamos, no economizers or feed heaters, no forced draft. She had a surface condenser, but the air, circulating, bilge, and main feed pumps were all a part of the main compound engines and she had not more than four deck engines, so in this department the engineer's work was comparatively light but he did not know it. Looking at him at work you would have thought that the whole weight of the universe was on his shoulders.

But the master in those days had to consider the sails, freeboard, and stability Unfortunately however, for many thousands of people, this latter he did not understand He took charge of whatever the owners gave and they in turn trusted the shipbuilders and classification societies. This seems to show that the master of forty or more years ago had a greater variety of work than the master of a great mail steamer has to-day while the engineer's work was more limited In a great turbine-propelled steamer there may be some surcease of labor in connection with the propelling engines but the number of auxiliary engines is vastly increased In some ships instead of ten or a dozen donkey engines there are about a hundred of such, and nearly two hundred cylinders, the operating and repairing of which the average master knows little or nothing about Then more work has to be got out of the boilers by forced draft and higher pressure From all this it appears to me that in the near future the executive officer on a great steamship, instead of being the master of the engineer will be an engineer master

CONSTRUCTION OF AN ELLIPSE.

To the Editor of the SCIENTIFIC AMERICAN

Having recently had occasion to perform an "envelope" construction for obtaining an ellipse, I made reference to your issue of August 25th 1906 (page 135) in which J B G gives the following envelope construction for drawing an ellipse when the axes are given

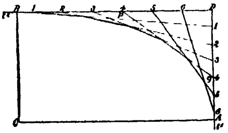

Fig 1

Let CA, CB be the axes of the required ellipse Complete the rectangle $ACBD$, divide DA and DB each into 13 equal parts and draw lines as shown each of which will thus be a tangent to the required ellipse

Now I wish to point out that the above construction is incorrect or at least that it is only a rough approximation for the lines in question are not tangents to the ellipse having the given lines as principal semi-axes

First. Let a b denote the magnitudes of the semi axes. The equation of the ellipse is then

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}=1$$

The condition that the right line $y=mx+c$ may touch this ellipse is that

$$c=\sqrt{a^2m^2+b^2} \qquad (1)$$

c being the intercept of the right line on the y-axis, and m the tangent of its inclination to the x-axis Now consider the line 4, 4 The co-ordinates of the points p and q through which it passes are respectively $\left(\frac{7}{13}a, b\right)$, $\left(a, \frac{5}{13}b\right)$ Its equation is, therefore,

$$\frac{x-\frac{7}{13}a}{a-\frac{7}{13}a}=\frac{y-b}{\frac{5}{13}b-b}$$

Put into the form of $y=mx+c$, this equation becomes

$$y=-\frac{4b}{3a}x+\frac{67}{39}b$$

Here $m=-\frac{4b}{3a}$, and $c=\frac{67}{39}b$, and it will be easily verified that the condition (1) is not satisfied Hence the line 4, 4 is not a tangent. The same may be shown generally or individually for each of the other lines.

Secondly When the axes are equal this construction should give a circle the form which an ellipse assumes in this special case but that the curve ob-

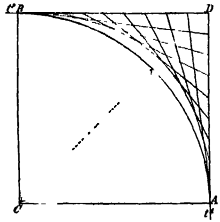

Fig 2

tained differs (in the case of the middle radius by as much as 4 per cent) from a true circle is seen in Fig. 2 As a matter of fact, both in this case and in the former more general case, the envelope obtained is a parabola touching DA, DB at the points t_1 and t_2.

Thirdly An inspection of the figure in question and Fig 1 on the page of your issue referred to will at once show that the shapes of the two curves differ considerably though the ratios of the axes in the two cases are by chance the same viz 2 3 the former oval is distinctly 'squarer than the true ellipse

I append a method of accurately obtaining an ellipse by an envelope construction It is based on Brianchon's theorem which states that if a hexagon circumscribe a conic the three diagonals are concurrent, and the converse of this proposition Thus

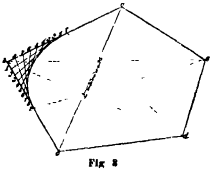

Fig 3

Let ab, bc cd de, ea be five given tangents to the required ellipse which are sufficient to determine it Join ac, bd be and let the two latter cut ac in p and q Produce dp eq to cut ab, bc in t_1 and t_2 which points will be the points of contact of the ellipse with these sides. For at_1 $bcde$ may be regarded as a hexagon of which the sides at_1 t_1b are in a straight line and whose diagonals are concurrent hence by the property stated above each of its sides touches an ellipse Since ab can only touch this ellipse once it follows that t_1 is the point of contact and the same reasoning applies to t By choosing a range of some 8 points at random in pq, and by joining d and e to each of these points in succession and producing these lines to meet bt_1 bt_2 respectively two new ranges of corresponding points are obtained when these are joined as shown in the figure a series of tangents to the ellipse which touches the five given lines are obtained The remaining corners may be taken off in a similar fashion but when the construction has been repeated for one of the opposite corners (d or e) with a little practice the rest of the ellipse can be sketched in quite accurately by free-hand

This construction adapts itself particularly well to obtaining the ellipse of gyration of an area or section in which five or six tangents are usually first obtained

Although the following point has no bearing on the above it might be of interest to some of your readers to know that meters may be reduced to yards by the same method that French pounds are reduced to English pounds viz. by multiplying by 1 1 This method is accurate to ½ per cent.

WARWICK WORTHINGTON

Pembroke College, Cambridge Eng

Paint for Shingle Roofs.—The wood surface to be protected must be well coated twice at short intervals with hot coal tar and to this coating a thin layer of pulverized screened brick-earth applied After a few days a perfectly solid mass will have formed, which will not only protect the wood against any absorption of moisture but at the same time obviate all fire risk, as it perfectly resists flames especially if, after a few days the coating is lightly renewed and so much brick-earth applied that the tar appears quite saturated

A NEW PROCESS FOR DAMASCENING, INLAYING, AND BLENDING METALS.

BY THE ENGLISH CORRESPONDENT OF THE SCIENTIFIC AMERICAN

Prayer book cover in copper inlaid with zinc

The beautiful art of damascening the origin of which is buried in the depths of antiquity, but which no doubt hails from the East has been subjected to repeated modifications during the past few years in order to render it more commercially applicable than it probably ever was even in its halcyon Oriental days The hand wrought work so exquisitely performed at the expenditure of considerable time centuries ago is far too costly for the present age, except to the connoisseur This process briefly consisted in chasing the design upon a metallic foundation of the object to be decorated and then filling the incisions with fine wire or strips of other metal, generally silver and gold by means of a special tool, the whole finally being smoothed and polished In order to render the inlay as immovable as possible, the recesses were undercut, so that the decorative metals were in reality dovetailed into the main fabric.

Such a delicate operation calls for remarkable skill and patience combined with a sensitive hand, and for this reason cannot be executed by machinery Yet at the same time there prevails at the present day a widespread demand for metal inlay work, and various methods have been evolved for the more rapid and cheaper accomplishment of the work, such as the ether parcel, or close plating fusion, electrical, and lead processes Recently however, attention has been centered in the new system of inlaying and ornamenting metallic surfaces that has been perfected by Mr Sherard Cowper-Coles the well known British electro-metallurgist which possesses great commercial possibilities, owing to the exquisite character of the work combined with the rapidity and cheapness with which it can be carried out

This process is based upon a discovery made by the inventor some five years ago during a series of experiments upon which he was engaged in connection with the annealing of iron In the course of these investigations he found that metals in a fine state of division that is in the form of powder when raised to a certain temperature which was actually several hundred degrees below their melting point, in contact with a solid metal volatilize or give off vapor, which condenses on the solid metal immersed in the powdered metal Recently the inventor in following up the discovery has turned it to distinct advantage for decorative work the results of which are similar to damascening but with the additional and important advantage that there is no possibility of the metals so blended together subsequently becoming separated as is often the case in ordinary damascening At the same time it also enables a more extensive range of effects to be secured as a large number of metals can be blended together which previously have been impossible and alloys of many colors and tints can be obtained in one operation of baking Moreover the thickness and depth to which the metals are to be inlaid and onlaid can be controlled at the will of the operator

The process is exceedingly simple The article to be decorated is first covered with a stopping-off solution about the consistency of cheese, and can thus be easily cut with a knife. The design of the desired inlay is then executed upon this composition by means of a specially designed tool having a sharp edge.

Oven in which the damascening is done.

The articles to be decorated are covered with metal dust and then heated to the required temperature.

Copper tray covered with the stopping-off composition ready for baking.

Those portions to be removed are then lifted and cleared away leaving the surface of the foundation metal exposed This operation completed, the article is placed in an iron box containing the metal which is to be used for the inlay in a powdered form If for instance, the inlay metal is to be zinc the box is accordingly charged with zinc dust a product obtained direct from the zinc-smelting furnaces The iron re-

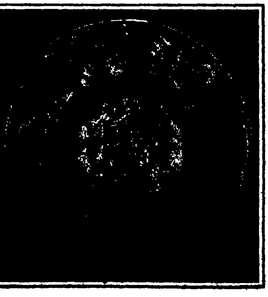
Hammer marks show through the inlay



Copper dish inlaid and onlaid with zinc.

Onlay is raised as much as $\frac{1}{16}$ inch above the copper surface.

A NEW PROCESS FOR DAMASCENING, INLAYING, AND BLENDING METALS receptacle, together with the objects to be ornamented and the zinc dust, are inserted in a suitable baking oven and heated to a temperature of about 500 deg Fahr, while the melting point of zinc is 686 deg. Fahr The time and temperature vary according to the thickness and depth of the inlaying which is required, and range from a few minutes to several hours. A little experience, however, soon teaches the operator the precise time and temperature necessary for obtaining given results with different metals.

When the article has been sufficiently baked, the box is permitted to cool, opened, and the articles withdrawn. Brushing with a stiff brush serves to remove the superfluous dust and also the stopping-off composition which the process of baking has loosened The stopping-off and baking processes can be repeated several times when it is desired to inlay two or more metals.

The point may be raised that the metal box containing the metal dust will in a short time become thickly incrusted with metal, but such experience has proved not to be the case, for the reason that the metal box is hotter than the powdered metal A useful type of furnace or baking oven for general work, such as panels, trays and other flat articles, is that shown in the accompanying illustration It consists of an iron vessel 8 feet in length by 4 feet in breadth and 1 foot deep The box is half filled with the metal dust, and the objects to be treated are well immersed in the powder care being observed that they are adequately covered over therewith The box is covered with a lid, and over this an iron framework is placed carrying fire bricks and provided with a small central flue to draw the heat from the burners up the sides of the box and over the top to secure even and regular heating over its whole surface Such a furnace can be constructed at a cost of about $150 complete

The damascening produced by this method is of a more permanent character than the ordinary ancient hand wrought process. It is impossible for the inlay to become detached from its foundation, for the simple reason that the two under the application of the heat become alloyed together It is also found that the inlaying metal in the case of zinc is very much harder than the brass or copper into which it is inlaid

One very notable feature of the process which is of considerable importance is that a wide variety of colors and alloys can be obtained in the one operation of baking. For instance a copper tray is to be inlaid with zinc and at the same time it is desired to convert certain portions of the copper into brass This is accomplished by varying the thickness of the stopping-off composition and by baking at a somewhat higher temperature than would otherwise be employed The result is that certain portions become converted into golden colored brass, while the other portions remain unalloyed copper The inlay work is carried out so delicately and evenly that in hammered metal objects the hammer marks in the original article will show through the inlay as if the decorative metal had been hammered in If desired, the metal foundation can possess the stippled hammered effect while the inlay has a smooth surface, thus giving a striking and pleasing contrast Some of the effects obtained are very beautiful in character The zinc inlay can be made so that it is surrounded by a fine line of brass, or be both inlaid and onlaid, in which event the latter ornamentation can be raised as much as one-sixteenth of an inch above the surface of the copper Again iron can be inlaid with both zinc and enamel which yields an attractive effect or a variety of hues produced by burning the whole of the copper surface with zinc and then etching the pattern down to the different alloys formed intermediate between zinc and brass By this arrangement the variety of tones secured is both extensive and beautifully graded It must not be thought that the effects secured are only obtainable by the use of zinc and copper Such is not the case since the more subtle shadings and hues between tin aluminium, nickel, cobalt, and other metals can be as easily produced In the photographs accompanying this article the contrasts of zinc and copper only are shown, for the simple reason that the colors possible by using other metals do not produce a sufficiently striking effect in a photograph.

Nor is the process merely confined to the embellishment of flat surfaces. It is as readily applicable to raised surfaces and objects of all shapes and sizes, such as teapots, coal vases, and other similar articles. It can also be adapted to the finest filigree as easily as to bold work, as is required in panels or heraldry An important development has been in connection with its application to book covers, the appearance of such damascened metal bound volumes being appreciably enhanced

One distinct charm about this new process and one that moreover is unique is the absence of the sharp line of demarkation as is characteristic of damascening Instead there is a soft transition from the inlay to the surrounding foundation metal That is to say where zinc is inlaid into copper the inserted metal is surrounded by a narrow band or halo of golden-colored alloy It is obvious therefore that very beautiful toned colored effects of great subtlety can be produced, ranging from silver white zinc to yellow brasses and bronzes of innumerable shades graduating to red copper and gradations of yellow and golden browns.

THE FIRST OF THE 1909 FLIGHTS FOR THE SCIENTIFIC AMERICAN TROPHY

The provisional winning for the second time on the 17th instant of the beautiful aeronautic Trophy given by this journal two years ago to further the science of aviation makes this a fitting time for us to again show it to our readers For the benefit of those who have not seen it before a brief description is herewith appended

SCIENTIFIC AMERICAN TROPHY

First competitive trial for 1909 won by Glenn H Curtiss on July 17th

Upon a globe representing the firmament Prof Langley's following-surface biplane is seen soaring through the clouds Surmounting the globe is an American eagle holding the wreath of victory in its beak The globe rests upon a whirl of clouds that rises from a base, from the sides of which spring winged horses carrying riders that bear aloft olive branches This beautiful piece of silver was presented to the Aero Club of America to stand for the highest achievement in aviation the world over At the time it was given, two years ago no one in America, with the exception of the Wright brothers had made a flight in a heavier-than-air machine, and the fact that these two aviators had at last conquered the air was not generally known It was at first proposed to hold competitions at stated times and places for the Trophy, but this was found impracticable, so that now the aviator who wishes to compete is allowed to choose his own time and place and the Aero Club will send a representative to witness the flight. The winner for any year is now the aviator who makes the longest and best flight in a closed circuit during the year

The conditions required at first were a flight of 1 kilometer (0 621 mile) in a straight line but it was not until July 4th 1908 that an attempt was made to fulfill these conditions. Upon that date Glenn H Curtiss (who had been experimenting with Dr Alexander Graham Bell in the latter's Aerial Experiment Association) made a flight of a little over a mile in the association's fourth aeroplane June Bug and was consequently declared the first winner of the Trophy In view of the flights that were being made by French aviators the conditions were then changed to 25 kilometers (15½ miles) in a closed circuit The first of the present year the conditions were changed as above stated 25 kilometers remaining as the minimum distance to be flown This is 5 kilometers (3 1 miles) more than is required in the international contest for the Bennett trophy and $5 000 cash prize which is to be held at Rheims France on the 29th of August

After having built and delivered to the Aeronautic Society his new biplane that he constructed expressly for this organization Mr Curtiss decided that he would attempt a flight for the SCIENTIFIC AMERICAN Trophy with this machine on July 5th at Morris Park just a year after he had won it the first time The flight was not attempted until dusk on that afternoon because of too much wind and when it was made it was merely a U shaped flight of about [illegible] mile The machine was then taken to Mineola L I and on July 17th another trial for the Trophy was made This was entirely successful as told in our last issue We give herewith some further particulars regarding this flight such as the times for each round of the triangular 1 31[illegible]-mile course etc

TIME OF LAPS IN G H CURTISS'S FLIGHT FOR THE SCIENTIFIC AMERICAN TROPHY

		Time of lap
Start	5 23 16	
1st lap	5 25 52	2.36
2nd lap	5 28 32	2 40
3rd lap	5 31 08	2 36
4th lap	5 33 48	2 40
5th lap	5 36 37	2 [illegible]
6th lap	5 39 11	[illegible] 44
7th lap	5 42 01	2 50
8th lap	5 44 45	2 44
9th lap	5 47 25	2 40
10th lap	5 50 15	[illegible] 50
11th lap	[illegible] 52 58	2 43
12th lap	5 5[illegible] [illegible]	2 52
13th lap	5 58 40	2 50
14th lap	6 01 32	2 52
15th lap	6 04 23	2 51
16th lap	6 07 14	2 48
17th lap	6 10 03	2 49
18th lap	6 12 53	2 50
19th lap	6 15 40	2 47

Total elapsed time 52 minutes [illegible] seconds
Total measured distance 24 94 miles
Average speed 28.51 miles an hour

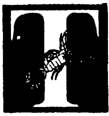
The course was triangular careful measurement made by Mr Charles M Manly after the flight showing the legs to be 2 045 2 442 and 2 446 feet in length respectively One circuit over the lines between stakes was therefore 1 313 miles but the machine of course covered a considerably greater distance as it made fairly wide turns The speed of the aeroplane was undoubtedly over 30 miles an hour The minimum distance required to win the Trophy was flown through with the completion of the twelfth lap the time for this 15 75 miles being 3[illegible] minutes and 34 seconds so that the flight was of 20 minutes more duration than was required It was only ended because of the fresh breeze that sprang up and also because Mr Curtiss feared his fuel would give out and he would not be able to land within 100 meters (328 feet) of the starting line as required in the rules He landed within 287 feet of the line

Mr Curtiss's success in flying double the distance required in the Bennett Cup race and the fact that the duplicate machine he has built to compete has a larger motor gives him a good chance of beating whatever speedy French monoplanes may be entered against him in the race at Rheims on the 29th ultimo Six of these machines—three Pelterie two Bleriot and one Santos-Dumont—and ten biplanes have been entered in the French elimination race to be held on August 22nd Three machines have been entered by England France and Italy and one each by Austria and America Some of the contests to be held during this aviation week are as follows

Grand Prix de la Champagne ($30 000) for longest continuous flight, speed test prize ($4 000) over distance of 30 kilometers, height prize ($2 000) for greatest altitude in excess of 50 meters speed prize ($2 000) for the fastest circuit of the course and passenger prize ($2,000) for carrying the greatest number of passengers 10 kilometers at the fastest speed

THE HEAVENS IN AUGUST.

BY HENRY NORRIS RUSSELL, PH D



THAT the hot weather of midsummer should be an astronomical phenomenon hardly seems possible to any one who is not an astronomer Still everyone can *determine* by direct observation that the heat comes from the sun and should be greatest when it rises highest in the sky, and shines on us for the longest time and it is easy to see how the stored up heat of early summer is carried on so that the maximum temperature falls, not in June, but in July or August

But when we ask How hot must the sun itself be, in order to send us so much heat at its enormous distance? the astronomer and the physicist must join in long and careful studies before the question can be answered In the first place the sun's temperature does not really depend on its distance at all If it was twice as far off and twice as big it would look just the same and send us just as much heat What we receive depends on how big the sun *looks* in the heavens and how bright it *really is per square mile* or square foot We can therefore compare it with substances in our laboratories, which though enormously smaller than the sun, are also enormously nearer, so that the two things balance

Now in the laboratory we find that all substances radiate heat to a greater or less degree even at the lowest temperatures we can produce Complete absence of radiation would only occur for a body at the absolute zero (i e one for which the motions of its molecules had all ceased) which can never be obtained in practice As the body grows hotter the radiation of heat from it rapidly increases However, at the same temperature some substances (such as polished metal) send out much less heat per square inch than others (such as a surface covered with lampblack)

For reasons which we have not space to detail the blackest substances (which at a given temperature send out most heat) are taken as a standard It is found that the amount of heat sent out per square inch by such a black body depends not on the particular substance but only on its temperature and that as the temperature rises the heat radiated increases as the fourth power of the temperature measured from the absolute zero Doubling the temperature increases the radiation sixteen times and so on We can find by actual experiment how much heat a black body apparently as large as the sun sends us at different temperatures and verify this law (which bears the name of its discoverer Stefan) The sun itself sends us very much more heat than a body of the same apparent size heated as hot as we can get it but by applying Stefan's law (which there is good theoretical reason to trust) we can estimate how hot we would have to heat our experimental body (if it could stand it!) to imitate the sun's condition

The problem then reduces to the exact measurement of the heat we get from the sun This is difficult because our atmosphere absorbs a good deal of it and it is hard to calculate how much By working on a high mountain (so as to have less air above one) and measuring the heat which we receive from the sun at different altitudes (that is through layers of air of different thickness) the problem can be solved with a good deal of accuracy

A very careful determination using delicate electrical apparatus to measure the heat received has been made by Dr Scheiner of the Potsdam University who set up his apparatus on a mountain in Switzerland, at an altitude of 10,000 feet.

Translating his results into the units most familiar in our ordinary life, it appears that the heat which we receive from the sun (if directly overhead) per square foot would raise the temperature of a pound of water 8½ deg F per minute.

Only about half this heat reaches the earth's surface (at sea level) directly The rest is absorbed in our atmosphere and helps to warm it. Even so, a man lying on the ground in the sun's rays, and presenting six square feet of surface to them, will receive more heat in an hour than is needed to raise a gallon of water to the boiling point. So it is no wonder he is warm!

Working out the sun's temperature from his data, Dr Scheiner finds it to be 5,950 deg C., or 10,740 deg. F, with an uncertainty of about 50 deg.

This is, however, the temperature which would give us the observed radiation if the sun was a "perfect radiator," and had no absorbing atmosphere. As a matter of fact all known substances have to be heated somewhat hotter than this theoretical temperature before they give out the same amount of heat. Also, if the sun's atmosphere stops some of his heat, the radiation from, and the temperature of, his actual surface must be greater than the *minimum* value here determined How much allowance must be made is a matter of judgment. Dr Scheiner estimates the actual temperature of the surface (if a good radiator) at 6 800 deg C or about 12,250 deg F

The highest temperatures attainable by artificial means (in the electric arc and furnace) are about 4 000 deg C or 7 000 deg. F

The sun's surface temperature, though higher than we can produce experimentally, is hardly of a different order of magnitude What the internal temperature may be we can hardly even conjecture, for we know too little of the properties of matter under conditions so far removed from our experience.

THE HEAVENS

The most characteristic of the summer constellations is perhaps Scorpio, which can now be well seen on the southern horizon. It is the finest of the twelve zodiacal constellations, but we never fully realize its brilliancy for a great part of it rises but a few degrees above our horizon As our initial letter shows, the resemblance of the constellation to the creature for which it is named is remarkably good

The great red star Antares is at the Scorpion's heart, its head and claws extend to the conspicuous vertical line of stars β, δ, π (in fact they once occupied a large part of what is now attributable to Libra) and the long, recurved tail sweeps down to the horizon and ends with the bright star λ, which might be called the Scorpion's sting.

Several individual stars are noteworthy β and ν are fine doubles, which are resolved into multiple systems by powerful telescopes. Antares itself has a close companion, less than 1/100 as bright as its primary, and very green. This is one of the finest pairs in the heavens, but is too difficult for small telescopes, unless the air is exceptionally steady μ is a naked-eye double, though hard to separate except on a very clear night, and one of the components is a spectroscopic binary, remarkable for the great mass and orbital velocity of the two bright stars which compose it.

To the left of Scorpio we see Sagittarius, with the familiar "Milk Dipper" (composed of the stars λ, φ, σ, τ, ζ) The magnificent star clouds in the Milky Way, which lie in this region, can now be seen at their best.

Capricornus, with the naked-eye double α, is in the southeast, and Aquarius is rising on the left. The great square of Pegasus is almost due east, and Andromeda is in the northeastern horizon. Cassiopeia is higher up, then Cepheus, then Cygnus, nearly overhead South of this are the small groups of Sagitta and Delphinus, then Aquila, with the bright star Altair Vega is almost exactly overhead, a splendid mark for the zenith. Due west is Hercules, then Corona, then Boötes, with the ruddy Arcturus. Ophiuchus and Serpens occupy the upper part of the southwestern sky, and Libra and Virgo the lower Ursa Major is in the northwest, and Draco and Ursa Minor in the north, above the Pole.

THE PLANETS.

Mercury is in conjunction with the sun on the 4th, and is invisible during the first half of August. Toward its end he can be seen just after sunset, but not as well as next month On the 25th he is very near Jupiter, about 1 min south of him, and should be easy to pick up

Venus is likewise evening star, setting about 8 P M. On the afternoon of the 12th she is in conjunction with Jupiter At 2 P M they are but 12 min. of arc apart, in the same telescopic field By nightfall in America they will have separated a little, but their distance will still be less than the moon's apparent diameter This close approach of the two brightest planets is well worth watching.

Mars is in Pisces, rising about 9 45 P M. on the 1st, and 8 P M on the 31st. He is very conspicuous, and will be an object of assiduous telescopic study, though his nearest approach to us does not occur till next month.

Jupiter is evening star in Leo, setting about 8 P M. in the middle of the month.

Saturn is in Pisces, about an hour east of Mars, and rises about 9 30 P M. on the 15th.

Uranus, which passed opposition last month, is in Sagittarius, well placed for observation. On the 15th he is in R. A. 19 h. 17 m. 30 s., dec. 22 deg. 44 min south, and is moving 8 s. westward and 15 s. southward per day

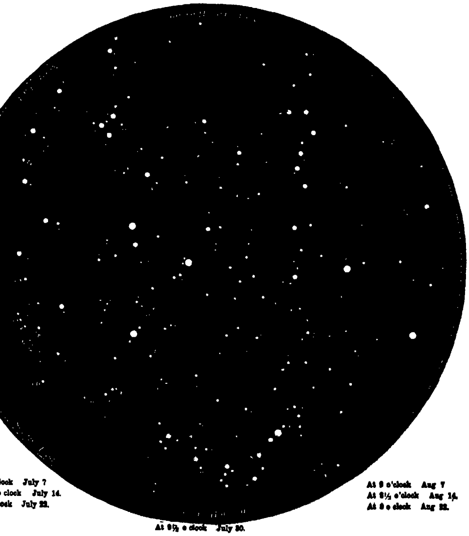
Neptune is in Gemini, observable, if at all, only in the early morning.

THE MOON.

Full moon occurs at 4 P M. on the 1st, last quarter at 8 A. M. on the 8th, new moon at 7 P M. on the 15th, first quarter at 11 P M. on the 23d, and full moon once more at midnight on the 30th.

The moon is nearest us on the 3d, and farthest off on the 19th. She is in conjunction with Mars on the 5th, Saturn on the 6th, Neptune on the 12th, Mercury on the 16th, Jupiter on the 17th, Venus on the 18th, and Uranus on the 27th.

A faint comet was discovered by Mr David at the Princeton University Observatory about the middle of June. Details of its orbit are not yet accessible to the writer.



At 11 o clock July 7

NIGHT SKY: JULY AND AUGUST

Handy Man's Workshop

HOW TO MAKE CONCRETE POTTERY—IV

BY RALPH C. DAVISON

(*Continued from the issue of July 17th*)

The method of making plaster molds for circular objects is somewhat similar to that described for making square or oblong molds in the last article Instead of making the outer mold in two pieces, however, as described for square work it is always better to make three pieces, as illustrated in Fig 14, for the reason that in making three pieces the liability of having an undercut or overhang on one of the halves of the mold is entirely obviated When two pieces only are made unless the mold is cut or parted exactly in the *middle* there will be an undercut on one piece of the mold, which would prevent the mold from freeing itself from the finished cast. By referring to the dotted lines in Fig 1, the meaning of an undercut will be made clear The distance *a* is less than distance *b* and so the part *c* can not be *removed* The method of making this outer mold is the same as was used for making the outer mold for the square form, excepting that as above stated there are three pieces instead of two to be made

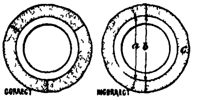

Fig 14.—CORRECT AND INCORRECT METHODS OF DIVIDING THE OUTSIDE MOLD

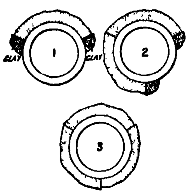

Fig 15.—SUCCESSIVE STEPS IN MAKING THE OUTSIDE MOLD

The position of the modeler's clay and the various steps *in the construction of* the outer mold is clearly shown in Fig 15 Shellac and oil the edges of each section before coating the next The sides of the concrete or cement cast if the object is of any size at all should be at least one-half inch thick, and therefore the core, which is to be composed of four pieces, as shown in Fig 16 at *A*, *B*, *C* *D* should always be at least one inch smaller in diameter than the inside diameter of the outside mold The first step toward making the core is to secure a box and fit it up as indicated in Fig. 17 The tapered center of the core *D*, shown in Figs. 16 and 18, should be made first. The foundation for this can be made by winding around the spindle in the box shown in Fig. 17 cheese cloth or mosquito netting which has previously been dipped in a thin "mixture" of plaster of Paris. After having prepared the spindle as above a template should be cut from a piece of tin and secured to the box as shown in the plan view, Fig 18 The tin template should be mounted on a piece of wood, to give it strength, and the wood in turn should be secured by small nails in position on the box as shown This template should be set the proper distance from the center of the spindle, so that on turning the spindle the center of the core produced will be of the exact size and taper desired, as indicated at *D*, Fig. 16.

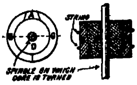

Fig. 16.—THE CORE MADE IN FOUR PIECES.

After having secured the template in the proper position mix up some plaster of Paris, as previously explained, and pour or throw it on the partly built-up core, at the same time turning the spindle by means of the handle The plaster thus added will adhere to and partly harden on the spindle. Keep adding plaster and turning the spindle until the plaster is built out to the template, which will cut or scrape it off and form it into a perfect cone. To smooth the surface of the cone, cut away all of the plaster that has adhered to the top of the template, and with your hand, which has previously been wet with water rub the surface of the cone as it is being revolved Now remove the template and shellac and oil the cone well with either heavy oil vaseline, or lard

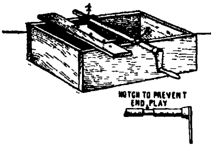

Fig 17.—BOX FOR TURNING PLASTER

The next step is to turn up or form the outer portion of the core A template should be made for this and secured to the box as was done for the center of the core care being taken to locate it in the proper position from the center of the spindle so that the diameter of the outside of the core will correspond to the desired diameter of the inside of the finished piece to be made

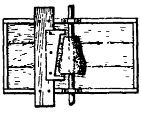

Fig 18.—TEMPLATE FOR INNER PART OF CORE.

Proceed to pour or throw the plaster mixture on the center of the core, which has already been oiled and keep turning the spindle until the plaster has been built up and scraped off by the template and the desired form produced to the outer surface of the core Smooth the surface off, as was done with the inside of the core or cone, and shellac and oil it well

Now remove the whole from the box by lifting up the tin strips 1 and 2 in Fig 17, which hold the spindle in place and part the inner core *D* from the outer section of the core by jarring the end of the wooden spindle lightly with a hammer The next step is to cut the outer sections of the core which is now in the form of a continuous ring into three pieces This can be done with an ordinary wood saw, the thinner the blade of the saw the better Use water on the saw blade while cutting as this will prevent it from binding Be sure to cut the sections as shown in Fig 16 The section *A* must be wider on the inner circumference than on the outer as shown Now assemble the three pieces into which the outer section of the cone has been cut around the inner section of the core *D*, so that they are again in the same position as shown in Fig 16, fastening them

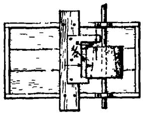

Fig 19.—TEMPLATE FOR PLASTER MODEL.

Then place the core as assembled in the box again care being taken to get it into the same position as before removing from the box, securing it in place by placing the tin strips 1 and 2 over both ends of the spindle as before Shellac and oil well the outer portion of the core again and then set in place on the box a tin template mounted on wood and shaped to correspond to the outer section of the finished piece, as indicated in Fig 19

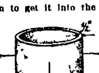

Fig. 20.—THE FINISHED PLASTER MODEL.

As we are now going to make a model in plaster of the finished piece, the sides of which must not be less than one-half inch thick the template as shown must be placed at least one half inch from the outer surface of the inner core After having adjusted the template proceed to throw on the plaster and turn it up until it is built out to the template and shaped into the desired form Smooth it off with water, and then shellac and oil Remove the whole from the turning box tap the end of the wood spindle, and if care has been taken to shellac and oil all of the parts as directed, the center of the core will fall out To remove the outer part of the core first take out the smaller piece *A* by forcing it toward the center The rest of the core will then collapse and we will have left a plaster model of the box, as shown in Fig 20 which we are to cast in cement Oil the outside of this well and then *proceed to* make the outer plaster mold in three pieces as already explained and as shown in Fig 15

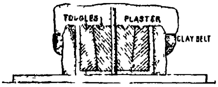

Fig 21.—PARTS ASSEMBLED FOR CASTING PLASTER CASE

After having made the outer mold proceed to assemble the parts as shown in Fig 21 and cast the plaster case as was described in the last article for square objects Use a clay belt around the outer mold as shown to prevent the plaster from coming down too far The spindle must be cut flush with bottom of plaster model Before casting the case be sure to shellac and oil all parts which will come in contact with the wet plaster used in casting the case After having removed the case assemble the parts again using the case as a base as shown in Fig 22 Cut the spindle flush with the core The mold set up in *this position* is ready to receive the liquid cement mixture which is poured the same way as already explained in the last article

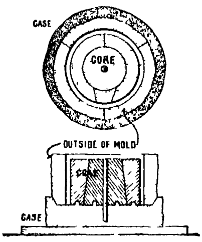

Fig 22.—PLASTER MOLD READY TO RECEIVE CEMENT MIXTURE

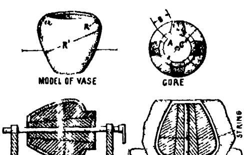

Fig 23.—STEPS IN MAKING A MOLD FOR A VASE

One need not confine himself to straight-sided objects as molds for pieces embodying curved outlines etc can also be made by following the general directions given for the mold just described the only difference being in the shape of the templates used It *will therefore* be unnecessary to go into details as to how to make a mold for a vase shaped as shown in Fig 23 as the illustrations which show the various steps, will make it clear to one who has followed the previous directions closely It will be noticed however that there is quite an undercut at the point *a* in this vase, owing to the mouth of the vase being of a smaller diameter than the greatest inside diameter of the piece. The main thing to guard against, therefore, in making the mold for this piece is the core. Care must be taken to have the distance B shorter than the diameter of the inside core or cone C. If this is not done it will be impossible to get the core out of the finished cast. It might be well to state the progressive operations in the making of this mold. They are as follows: First, make inner core or cone. Second, build up outside part of core. Third, remove outside part of core and cut into pieces as shown. Fourth, reassemble core and place in spinning box. Fifth, build up and turn plaster model of piece to be cast. Sixth, remove all pieces from spinning box and cast outside mold. Seventh, cast case.

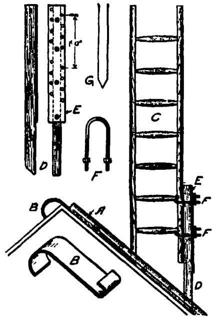
(To be continued.)

A LADDER EXTENSION LEG

BY I O BAILEY

A painter or any other mechanic is sometimes called upon to paint or repair work which is very unhandy to reach. Perhaps a ladder is to be supported in some manner upon a slanting roof of a shed or other building. Such a case happened very recently when the following scheme was adopted by a mechanic with success.

A ladder A was supported from the peak of the shed roof by means of a plate B bent in the shape of a hook. Two painter's hooks would do just as well. The plate B was about 8 or 10 inches wide and 3 feet 6 inches long before being bent. The grip on the roof peak should not be less than 6 or 8 inches. The second or working ladder C was supported on the first ladder A by an extension leg D made of 4 by 4 timber of tough quality. The foot of this leg D, was shaped as shown in detail to fit against the rounds of the ladder on the roof. A plate E furnished with a number of holes for a couple of U bolts F was screwed down to the leg D. The holes were staggered and spaced 2½ inches apart on each side, allowing adjustment of 1¼ inch each way to accommodate different pitch of roofs. The distance apart of each group of holes in the plate F should equal the distance apart of rounds of the ladder, usually 1 foot, so that the rounds of the ladder will bear on the U bolts, which should be drawn up tight when the proper adjustment has been made.



HOW TO SUPPORT A LADDER ON A SLANTING ROOF

If the extension leg was made of steel of smaller dimension than the timber one, furnished with a sharp point G to stick in the shingles of the roof, the ladder A and hook, B could be dispensed with.

AUTOMATIC LUBRICATING CUP

BY W J C

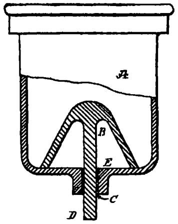
In lubricating the reciprocating parts of vertical engines there is considerable waste of oil, and the lamp wick dangling from the end of the oil pipe forms a collector of dust and grit, which is carried to the bearings. The waste of oil is principally through the fact that when the engine stops the oil still continues feeding and drops into the crank pit rather than into the oil cup.

Much of this can be avoided by the use of an oil cup such as shown in the accompanying sketch. It consists of a cup of the usual shape having inside a mushroom-shaped valve B which is ground to a tight seat at E. The stem D passes through a clearance hole C in the bottom of the cup. When the cup is filled with oil the mushroom valve prevents its flow as long as the engine is at rest.

The cup is placed directly over the oil cup which is to receive the oil, and which moves in a vertical direction. By means of adjusting screws its height is so arranged that the stem of the valve is raised slightly as the oil cup comes to the top, thus allowing a small amount of oil to pass inside the valve and flow down the stem. The receiving cup should be filled with horsehair, to rub off the necessary oil from the stem.

The oil flows only when the engine runs, and in proportion to the speed of the engine.

No time is lost nor oil wasted in shutting off the supply when the engines are secured, and the stem can be easily wiped clean of all dust if it has remained unused for some time.



AUTOMATIC LUBRICATING CUP

This cup could be used on horizontal engines by a slight modification of the stem, but on vertical marine engines, as on tugs, where the engine is run intermittently, the writer has seen it do good service and save many times its cost in oil, labor and hot bearings.

EXPERIMENTS WITH ALTERNATING CURRENT, USING A SMALL DIRECT-CURRENT MOTOR

BY F P McDERMOTT, JR.

A small direct-current motor, such as can be purchased for about a dollar, will operate in various ways as an alternating-current motor. These methods of operation are not recommended for regular use, but they serve as excellent experiments with alternating currents.

A series-wound motor with a three-part commutator is suitable. Owing to the variety of such motors on the market only general directions can be given here, leaving the details to the judgment of the experimenter. If the motor is to be connected to an alternating-current circuit of about 110 volts it is necessary to have some means of limiting the current passing through the windings. The diagrams show a lamp rheostat used for this purpose. The rated voltage of the lamps should not be less than the voltage of the circuit, for the resistance of the motor may be so low that the lamps will receive almost the full voltage of the supply and they would then be burned out if made for a lower voltage. A rheostat enabling any number not exceeding ten of 16-candle-power carbon filament lamps to be connected in parallel is large enough. In determining whether the wiring and fuses through which the current is supplied have sufficient carrying capacity, remember that each lamp takes about ½ ampere when supplied with its rated voltage. The current per lamp will be less than this when the motor is in series with the lamp rheostat.

Make the connections to the motor with all of the lamps turned off, and start by turning on the lamps until the motor receives sufficient current. Do not turn on so many lamps that the motor attains an excessive speed or temperature.

Of course, a suitable step-down transformer or a reactance coil may be used instead of a rheostat.

When the motor is in proper condition to operate as a direct-current series motor, it may be operated as an alternating-current series motor. With the exception of inserting the rheostat, the motor is connected to the alternating-current circuit in the same way that it is connected to a battery when run as a direct-current motor. (See Fig. 1.) To reverse the direction of rotation, transpose the wires connected to the brush holders, as would be done to reverse it when operating with direct current.

A repulsion motor consists of a stationary field magnet, through the winding of which alternating current is passed. The armature is similar to a direct-current armature. Instead of the two brushes, or, in larger machines, the two sets of brushes (corresponding to the positive and negative sets of brushes in a direct-current machine) being insulated from one another, they are connected together. To run the motor as a repulsion motor, it will be necessary to shift the brushes until the proper position for operation is found. If the brushes supplied with the machine can be readily shifted, then they may be connected together by connecting a wire to the two brush holders. If they cannot be readily shifted, remove them and bend a piece of copper wire into the shape shown in the diagram (Fig. 2) so that it can embrace the commutator and touch it at diametrically opposite points. This wire acts as two brushes connected to one another, and for experimental purposes may be held in place by hand. After the brushes have been arranged, pass current through the field winding, as shown in Fig. 2, and vary the position of the brushes until the motor runs.

The inverted repulsion motor differs from the repulsion motor in that the alternating current is supplied to the armature, and the field winding is short-circuited. To obtain this motor (Fig. 3) connect together the two ends of the field winding and supply current to the armature. As was the case with the repulsion motor, it is here necessary to shift the brushes until the proper position for operation is found. If the brushes supplied with the motor can be readily shifted, supply current to the armature through them. Otherwise, the current may be supplied to the armature by removing the regular brushes and pressing the wires carrying the current against the commutator at two diametrically opposite points, shifting them until the proper position for operation is found. The repulsion and inverted repulsion motors are reversed by shifting the brushes.

In the single-phase induction motor current is supplied to the stationary winding and the revolving part consists of a winding having short-circuited coils, or else a squirrel-cage winding.

To obtain the induction motor, wrap a few turns of wire around the commutator, so that each coil of the armature is short-circuited. Run without brushes, supply current to the field winding only, according to Fig. 4. Unlike the other motors here described, the single-phase induction motor is not self-starting unless special devices are provided to make it so. When these devices are absent, as in the case here, the motor will run equally well in either direction when once started. Start by giving the shaft a twist with the fingers or by wrapping a piece of string around the shaft and rapidly pulling it off.

For the theory of these motors, and also the modifications in construction used to secure better operation, consult textbooks on alternating currents.

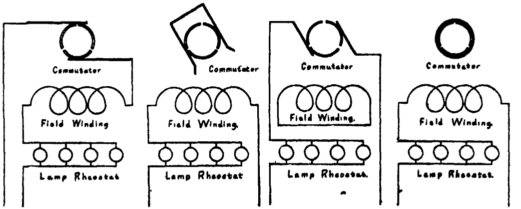


Fig. 1 Fig. 2 Fig. 3 Fig. 4

DIAGRAM OF CONNECTIONS FOR THE EXPERIMENTS.

DEVICE FOR REMOVING BROKEN WOOD SCREWS.

BY G H SINCLAIR.

For the past fifteen years I have successfully used a tool for the removal of broken wood screws made on the same lines as the soft brick pipe drill shown in Handy Man's Workshop of February 27th, 1909.

The size of the pipe needed can be obtained from the shank of the broken screw, though it is desirable that the pipe should be a trifle larger, to allow for clearance and in case the screw should not have been run straight. Any piece of brass or steel tubing can be used, while steel is better, brass is more readily obtained. After the teeth are filed, bend every alternate tooth out a trifle for clearance. Use this pipe bit, and bore out the broken off screw. Glue in a plug, and you can run in a new screw, never knowing the old one had been broken.

RECENTLY PATENTED INVENTIONS.

Pertaining to Apparel.

COLLAR.—B. S. ELLIS, Troy, N Y The purpose of this invention is to provide a collar having improved means of attaching the same to the collar button at the back of the neck band, and which will operate to prevent the button at this point from coming in contact with the cravat or necktie which may be worn with the collar

EAR-JEWEL FASTENING —C WELLER, Newark, N J The improvement refers to jewelry and its object is to provide a jewel fastening arranged to securely hold the jewel in place on the lobe of the ear without requiring piercing thereof and to allow convenient manipulation of the fastening when applying or removing the jewel

Of Interest to Farmers.

TROUGH —J S. WEAVER and J B WEAVER New Oxford, Pa This invention is an improvement in troughs such as are generally used for feeding and watering stock and has in view a trough such that the ends may be easily applied to and detached from the body and from water-tight connection therewith, whereby the parts when disassembled can be closely packed convenient for shipment and stowage.

DESICCATING APPARATUS —J ROSH Spokane, Wash This apparatus may be used for carrying out the process disclosed in a divisional application formerly filed by Mr Rosh The invention relates more particularly to an apparatus especially designed for use in the treatment of milk to remove the water therefrom and produce a powdered product

NOTE -Copies of any of these patents will be furnished by Munn & Co. for ten cents each Please state the name of the patentee title of the invention and date of this paper

Legal Notices

PATENTS

INVENTORS are invited to communicate with Munn & Co., 361 Broadway, New York, or 625 F Street, Washington, D C, in regard to securing valid patent protection for their inventions Trade-Marks and Copyrights registered. Design Patents and Foreign Patents secured.

A Free Opinion as to the probable patentability of an invention will be readily given to any inventor furnishing us with a model or sketch and a brief description of the device in question. All communications are strictly confidential. Our Hand-Book on Patents will be sent free on request

Ours is the Oldest agency for securing patents; it was established over sixty years ago.

MUNN & CO, 361 Broadway, New York
Branch Office, 625 F St, Washington, D. C

INDEX OF INVENTIONS

For which Letters Patent of the United States were Issued for the Week Ending July 13, 1909,

AND EACH BEARING THAT DATE

[See note at end of list about copies of these patents.]

Acceleration controlling device, W. A. Wolcott	928,013
Adding machine, A. H. Jennings, reissue	12,967
Adjustable clamp, Buswell & Camaden	927,942
Advertising device, B. Hagen	927,966
Aerial device, L. Rupple	927,815
Aeroplane, J. Seller	927,606
Air brake systems, angle cock support and lock for, W. K. Sharp	927,646
Air liquefier, J. F. Place	927,591
Alloys of zinc with copper, making, S. Elliott	927,843
Antisiphon trap, G. O. Miller	927,607
Arc shade for gas illumination and other uses, M. Herskovits	927,726
Atomizing, etc., method of and apparatus for, A. Sala	927,891
Automatic switch, I. Dyer	927,812
Automobile curved road illuminator, D. W. Wells	927,619
Automobile fender or life guard, J. A. Harris, Jr	927,590
Automobile frame suspension, E. C. Shumard	927,686
Automobiles, reclining seat for, J. H. Lord	927,596
Axle device, differential, L. B. Hibbard	928,194
Baker's peel, H. R. Jones	927,547
Balance wheel staff, C. M. Jore	927,809
Baling press, W. S. Livengood	927,807
Band saw knife for trimming shoes, W. H. Keighley, et al	928,137
Basket, work, F. D. Miller	928,207
Bath apparatus, vapor, B. Anderson	927,629
Battery grid, J. K. Pumpelly	927,812
Beam, pilot, C. O. Hogen	928,200
Bearing, ball, H. Burchardt	927,937
Bearing for rotary journals, counterbalanced, G. P. Herrick	928,130
Bearing, shaft, R. F. Halliwell	927,791
Bed bottom spring, T. Kilpfel	927,992
Bed, settee, J. Phillipson	927,811
Belt, safety, G. L. Drumeville	927,839
Belt with standing sides, endless traveling, G. Gates	927,618
Bicycle, G. H. Meiser	927,949
Bicycle prop, Williams & Patterson	927,639
Binder sheaf carrier, J. G. Pillow	928,067
Binder, temporary, W. S. Mendenhall	927,741
Blind, awning, W. D. Williams	928,012
Blind operator, window, W. J. Sterling	927,894
Block. See Toy block.	
Boat construction, W. H. Cole	927,640
Boiler furnace, steam, O. H. Orvis	927,672
Boiler plug, collapsible, Blackwell & Vaughan	927,982
Boiler stand, P. F. Murphy	927,749
Boilers, forming openings for washout plugs for, H. B. Ayers	927,673
Bottle blowing machine, E. H. Winder	927,913
Bottle cleaning machine, O. Bick	928,084
Bottle closure and stopper extractor, combined, C. J. Korzpeter	927,732
Bottle holder, milk, W. L. Johnson	[illegible]
Bottle locking bar, S. M. Hastings	928,197
Bottle stopper, W. L. Bedman	927,771
Bowl holder, A. S. Framlach	927,723
Bowl holder, C. M. Haynes	927,724
Box, F. Jager	927,800
Box fastener, T. S. Tubey	927,614
Box form, adjustable, H. De Smith	927,501
Box staying machine folder, H. De Smith	927,502
Brake mechanism, C. A. Burke	927,941
Brake safety device, car, H. S. Foster	927,847
Breech closure, M. Hormsdorf	927,865
Brick anchor, C. A. Londelius	927,663
Brick cutting machine, J. C. Ross	927,878
Brick press off bearing attachment, W. S. Cunningham	927,634
Bridle rosette, C. C. Bailey	927,625
Bristle bunching machine, H. H. Cummings	927,832
Brush, G. Pavlik	927,870
Brush, shaving, W. H. Lopp	927,568
Buckle, G. H. Nearing	928,212
Buffing device, M. H. Ballard	927,928
Buffing machine, I. B. Taylor	928,164
Buggy top and curtain, E. C. F. Becker	928,009
Buildings, sheathing metallic frames of, G. Webster	928,092
Butter, etc., machine for cutting, D. M. Lemon	927,734
Button fastener, A. Micklish	927,574
Cabinet, check, D. E. & E. H. Ingle	927,799
Cake coating machinery, G. I. & C. E. Mossop	927,576
Calculating machine, F. Trinks	928,063
Calculating sheet, interest and time, W. Sparklin	927,603
Camera, A. W. Straight	927,897
Candle or lamp holder, W. W. Katterjohn	928,131
Cane stripper, T. J. Peters	928,140
Canning apparatus, J. F. McIlvaine	928,144
Can opener, B. E. Morse	927,744
Can opener, R. Braun	927,938
Cans, detachable spout for shipping, G. W. Weber	927,617
Car aisles, means for preventing congestion in, A. J. Breda	927,707
Car and train pipe coupling, combined, R. Rittenhouse	927,600
Car brake beam, railway, W. I. Eckert	927,647
Car door construction, T. Mills	927,992
Car draft rigging, railway, W. J. Mack	927,737
Car, dumping, Sherman & McKelvey, reissue	12,998
Car grain door, W. S. Williams	927,700
Car grain door, L. P. Roberts	928,005
Car running gear, mine, J. M. & R. F. Phillips	928,000
Car safety apparatus, motor, Barberie & Walsh	927,475
Car step extension, D. Jones	928,128
Car, street, C. B. Price	927,871
Cars, extension hanger strap for street, H. Murray	928,111
Carbureter, N. T. Harrington	927,929
Carbureter, M. Laux	927,868
Carbureter, J. S. Goldberg	928,042, 928,121
Carriage, folding, A. W. Lashbaugh	927,987
Carton cell, J. H. Carter	927,189
Caster, F. Villiers	928,087
Casting apparatus, pressure, R. N. Le Cron	927,661
Casting ladle, D. Collier	927,715
Ceiling hook, H. I. Bradley	927,483
Chair, C. S. De Moulin	927,717
Chair, H. F. H. Collings	928,107
Chair rocker, C. M. Stratton	927,808
Chalk line holder, J. G. Hall	927,790
Chandelier attachment, G. J. Murphy	927,746
Check folder, transportation, W. H. Carroll	927,710
Chopper. See Cotton chopper.	
Chuck, Davidson & Yorty	928,111
Chuck, adjustable angle, F. I. Crouse	927,403
Chuck, tool, J. I. Bartholomew	927,478
Cigarette and like paper holder, W. S. King	928,068
Cistern mold, collapsible, D. Laughlin	927,806
Clock or similar mechanisms, electric apparatus for driving, H. F. Warren	927,907
Clock, ship's bell, P. Lux	927,568
Clod cutter, G. W. & J. L. Voelkel	928,088
Closet bowls, manufacturing siphon, Walton & Pauck	927,908
Clothes cleaning apparatus, A. R. Keser	927,519
Clothes line holder, R. Kummer	927,553
Clothes pin, J. A. Freese	927,840
Clothes pressing apparatus, A. J. Hoffman	928,100
Clothes rack arms, cabinet for, A. A. Taylor	928,081
Clothes stick, J. Johnston	927,540
Coal cutting machine, Jones & Hall	928,050
Coat, M. A. Adler	928,017
Coated article and making same, Shoemaker & Midgley	928,074
Coffee mill, R. C. Hedwick	927,971
Coiling pipe, I. C. Schneider	928,073
Coin freed machine, C. F. Hibberd	928,059
Collapsible box, R. I. Brown	927,485
Collar, G. W. Slifer	927,880
Collar and cuff edge finisher, E. J. McCauley	927,670
Collar pad, horse, J. W. Foster	927,721
Compression stop and waste, A. C. Schuermann	927,693
Concrete cattle guard, reinforced, J. H. Hammill	928,102
Condenser and making same, electrical, Shoemaker & Midgley	928,224
Condenser, steam, G. Hartman	928,125
Connecting slide, D. C. Rockwell	927,601
Controlling and locking device, G. F. Larkin	927,884
Conveyer, C. D. Seeberger	927,685
Conveying system, W. R. Cunningham	928,183
Cooking utensil, M. Geig	927,521
Cooking vessel lid holder, J. C. Landkrohn	927,861
Cooling apparatus, K. Nakagawa	928,116
Core making machine, F. C. Francisco	927,848
Core slitting machine, cabbage, Wagenhauser & Newland	927,904
Corn rack, seed, M. I. Dickerson	928,105
Cotton chopper, H. B. Dekin	928,112
Counting machine, F. Spence	927,610
Coupling, Johnson & Leider	928,055
Coupon cutter and counter, E. H. Barlow	928,019
Cradle, child's, H. Levin	927,599
Crane, fleeting, Bode & Bottcher	927,934
Cranking handle, G. J. Dallison	927,642
Cross arm fitting and insulator support, S. B. Way	928,010
Cross head, safety, K. M. Dahl	927,774
Cultivator, E. H. Griffith	927,788
Cultivator, F. J. Craig	928,020
Cultivator, R. I. Stalans	928,070
Cultivator attachment, corn, H. Neff	928,146
Cutlery, J. Heissenberger	927,985
Cycle lock, J. M. Barrett	927,927
Dental appliance, J. Gartell	927,650
Dental silk receptacle, H. Emerson	927,844
Depth recorder, J. W. Gillie	928,191
Derrick, portable, C. H. Roberts	927,690
Desk attachment, school, Baylor & Knouff	927,490
Desk, convertible office, J. G. E. Dey	928,188
Dish washer, J. S. Walter	927,905
Dish washing machine, K. R. Parry	927,590
Disintegrating cylinder, J. Dixon	927,655
Dispensing apparatus, F. W. Williamson	928,080
Display cabinet, F. S. Woldridge	927,625
Distributer and timer device, combined, Mueller & Jacob	928,209
Distribution system, I. Rose	928,219
Door and fastener, silo, K. Kleven	927,550
Door hanger, W. B. Lewis	928,137
Doors, closing device with stop for swinging, A. Damitz	[illegible]
Dough, machine for the transport of, G. S. Baker	927,474
Draft device, H. Barber	928,109
Drain connection, Tawes & Reed	928,052
Drawing table, G. H. Grove	927,526
Dredging machine, J. W. Singleton	927,690
Drilling machine, T. Harris	927,528
Drilling machine, C. B. Richards	927,679
Driving mechanism, H. A. Bandor	927,892
Drying machine, C. Jordan	928,202
Dye and making same, sulfur vat, Mayer & Pfannenstiel	927,868
Dyeing machine, Richardson & Naef	927,599
Educational device, J. Davis	927,499
Elastic composition, H. K. M. Holst	928,063
Electric machine, dynamo, W. H. Frost	928,027
Electric switch controlling system, F. G. Prewitt	928,065
Electric switch instrument, C. W. Coleman	927,714
Electric time switch, O. A. Braun	927,498
Electric energy, means for utilizing, T. F. Perkins	927,676, 928,214
Electrolyzer, E. Hines	927,970
Electromagnets, construction of, E. Lacy	928,136
Elevator automatic safety stop, A. J. Dawe	927,500
Engine cylinder cooling device, S. W. Best	927,702
Engine lubricating device, A. Kreis	927,582
Engine starting device, internal combustion, Rosier & Igou	927,681
Engines and the like, apparatus for removing dust and foul gases from carding, H. Smethurst	928,159
Engines, mechanism for controlling the operation of internal combustion, W. J. McVicker	927,592
Engraving machine, pantograph, Hawthorne & Pryke, reissue	12,990
Envelop check, manifolding, A. L. Ervin	[illegible]
Evaporating apparatus, W. & A. Gaulin	[illegible]
Exercising machine, J. F. Vanderloos	[illegible]
Extension table, M. Flaholm	[illegible]
Extension table, A. G. Wettergren	927,911
Eyeglass clip, W. G. King	927,981
Eyeglass mounting, T. E. Carpenter	927,617
Fabric. See Knitted fabric.	
Farrier's tool, A. I. Merrifield	927,900
Fastener, A. C. Leahy	928,103
Faucet, M. J. Ryan	927,880
Faucet, H. M. Alderfer	928,005
Faucet, electrically heated water, F. A. Robinson	927,755
Faucet or street washer, antifreezing, J. T. Harnett	928,047
Faucet, time, Beardsley & Cassidy	927,701
Fence post, metallic, F. A. Colver	928,108
Fence wiring clamp, I. C. Hinkle	928,127
Fertilizer distributer, W. J. Adams	[illegible]
Fertilizer distributer, P. Buswell	[illegible]
Fertilizer distributer, Buswell & Camaden	[illegible]
Fiber treating machines, feeding mechanism for, J. N. Selvig	928,221
Filter, F. Bellemschmidt	927,888
Filter, J. W. Morrison	927,713
Fire brick lining, bank, S. B. Newberry	[illegible]
Fire door lock, R. M. Metcalf	[illegible]
Fire escape, C. R. Anderson	[illegible]
Fireproof construction, W. F. Lotthoff	928,151
Fish stringer, J. Dineen	927,840
Fish trap, F. J. McEwan	928,143
Floor dressing machine, G. J. Kepplinger	927,548
Floor scraper attachment, J. Mielke	927,742
Flowers, candles, etc., holder for, C. L. Patterson	928,211
Flue protecting shield, furnace, H. W. Lash	[illegible]
Fluid brake, F. Bomingham	[illegible]
Fluid translation device, R. N. Ehrhart	[illegible]
Fluids under high pressure, transferring apparatus for, J. A. Hoff	927,708
Flushing device, F. F. Hawkins	927,790
Folded corner can or vessel, J. M. Hothersall	927,537, 927,538
Food warmer, R. W. Munn	[illegible]
Foods, etc., by liquid air, apparatus for cooling and preserving, J. F. Place	927,593
Fuel pan, T. D. Bausher	[illegible]
Funeral cars, body for, J. W. Butler, et al	928,170
Funnel, W. Lewis	928,138
Furnace, C. Kreuzbell	[illegible]
Furnace regulator and radiator, combined, F. S. Harmon	927,702
Furnaces, change over device or valve for Siemens-Martin or other regenerative, G. von Becken	927,930
Fuse with double action, J. Harle	[illegible]
Gage and marking device, A. Veitch	[illegible]
Game, B. B. Bennett	927,631
Games, summator for checkers or similar, A. Nelson	927,581
Garment fastener and supporter, H. K. Walker	928,001
Garment hanger, J. T. Viganego	928,060
Garment supporter clasp, J. C. Copeland	927,651
Gas analyzing apparatus, G. A. Cederberg	[illegible]
Gas, apparatus for converting volatile hydrocarbons into fixed, H. F. Smith	928,078
Gas burner, S. C. Wilson	927,925
Gas fixture, W. F. Oistet	927,671
Gas generator, acetylene, C. H. Emerson, et al	927,780
Gas generator, acetylene, F. F. Miller	[illegible]
Gas generators, feed for acetylene, Boland & Hinkle	928,022
Gas lighting apparatus, R. M. Dixon	927,710
Gas mantle holder for incandescent, A. Martini	927,665
Gas manufacturing, B. Brazelle	[illegible]
Gas or vapors to the action of liquids, apparatus for subjecting, Fowler & Medley	928,118
Gas separator, natural, A. W. Barker	927,470
Gate, J. B. Bullock	[illegible]
Gate, M. Kirtland	927,779
Gearing, controlling mechanism for variable speed, J. F. Warner	[illegible]
Glass tank furnace, R. H. Rolin	928,175
Globe holder, R. M. Dixon	927,718
Governor for internal combustion engines, electromagnetic, F. Hubbard	927,541
Grader, road, W. S. Livengood	928,205
Graphophones, speed changing mechanism for, F. F. Murdock	927,800
Grate for drying purposes, basket, A. Wien	[illegible]
Grate, rotary, T. Kaufman	927,770
Greenhouse construction, J. F. M. Farquhar	927,808
Grinding machine drill rest, I. E. Shee	927,757
Ground, machine for preparing and ridging corn, A. I. Gabrud	928,122
Gun attachment, shot, O. F. Michaud	[illegible]
Gun barrels, transport carriage for portable recoil, H. Kunnenberg	927,900
Gun protecting shield, Lauber & Kanonenberg	[illegible]
Gun, shot, O. F. Michaud	[illegible]
Guns, fluid brake for recoil, Lauber & Bomighaus	[illegible]
Hame fastener, F. O. York	[illegible]
Handle, R. R. Brakeman	928,101
Harness, C. R. Austin	[illegible]
Harrow, I. Harl	928,040
Harrow attachment for plows, C. H. Meyers	[illegible]
Harrows, lock jointed [illegible] draft beam for sectional, F. C. Clausen	927,711
Harvesting machine, corn, W. H. Pilson	[illegible]
Harvesting machine, corn, E. Laking	[illegible]
Hat bands, H. F. W. Arnold	927,703
Hat pin, R. V. Skinner	927,888
Hats of straw, palm leaf, and the like, manufacture of, H. I. Pearson	927,674
Hay, device for transporting and weighing baled, F. McGillachay	927,590
Hay fork, double harpoon, I. A. Myers	[illegible]
Hay press, B. Carr	927,820
Hay sweep, J. A. Scherts	927,881
Headlight, C. L. Betts	927,708
Heater. See Water heater.	
Heating by aid of vacuum, system of, C. C. Peck	927,591
Heating system, F. H. Gold	928,041
Heating system, low pressure fluid, E. H. Gold	928,040
Heel cushion, M. H. Crane	927,831
Hoisting cylinder, M. F. Berry	928,100
Hog ring, R. Roethlisberger	928,165
Horseshoe, A. Kerry	927,731
Horseshoe calk, H. W. Schoen	927,884
Hose coupling, M. G. Otis	927,590
Hose nozzle, E. C. Delene	927,837
Hose pipe, W. R. Calvert	[illegible]
Hose rack, R. D. Wirt	927,623, 927,624
Hot air furnace, C. A. Simonton	927,608
Husking roll, A. Rosenthal	927,814
Hydraulic pipe, J. T. Langford	928,213
Igniter device, electric, L. Baskin	927,704
Ignition systems, induction coil for, B. L. Lawton	928,204
Incubator, H. H. Charles	927,711
Incubators, device for rotating eggs in, D. A. Callaway	[illegible]
Index box, R. I. Roberts	927,734
Indicating mechanism, C. W. Canine	[illegible]
Insulating stud, L. E. Underwood	928,084
Insulator support, F. Woodmansee	927,701
Insulators, manufacture of spar, F. M. Locke, reissue	12,992
Invalid's chair, F. B. Higgins	928,031
Iron, a product having cutting and other properties of high-grade tool and high-speed steel, producing from foundry, E. A. Custer	927,405
Iron, metal product from cast, E. A. Custer	927,406
Iron or steel for casting, preparation of, P. Rakowicz	927,678
Ironing table, C. W. Dodsworth	927,841
Jar closure, J. R. Barranger	928,008
Jewelry catch, safety, A. O. Burgess	927,827
Joint connection, knuckle, M. Kelly	927,978
Journal bearing, L. J. Aldridge	927,471
Key fastener, W. Curlett	[illegible]
Key hook, N. L. Thomas	[illegible]
Kinetoscope, A. C. Roebuck	927,876
Kitchen implement, G. Koenigstein	928,184
Kite box, C. Cruber	927,965
Knee warmer, D. I. Galbraith	927,785
Knitted fabric, R. W. Scott	928,221
Knitted fabric, ribbed, R. W. Scott	928,222
Knitting machine, N. J. Wiklund	927,915
Knitting machine, Wilson & Paquette	928,165, 928,166
Knitting machines, fashioning device for straight, C. H. Usher	928,229
Lacing hook setting machines, spacing mechanism for, W. F. Fraser	927,647
Ladder, O. Collette	927,491
Lamp, arc, G. I. Stevens	928,161
Lamp, arc, Fleming & Hale	928,189
Lamp, central draft incandescent oil, C. Blankenburg	927,710
Lamp filaments, manufacturing electric, W. von Bolton	927,985
Lamp, incandescent gas, H. Blau	927,770
Lamp, incandescent petroleum, A. B. Kraywiec	927,804
Lamp safety attachment, A. Kartal	927,874
Lamp socket and bulb remover and replacer, electric, D. L. Watt	927,909
Lantern, tubular, C. Bergner	927,767
Lanterns, bail holder for, F. K. Wright	927,700
Lanterns, operating means for signal, G. R. Milliron	928,208
Latch for doors, gates, windows, etc., H. R. Crumpton	928,030
Latches, emergency exit, attachment for knob, A. M. H.	927,654
Lath bolt, O. F. Fisher	[illegible]
Lathe stock, means for securing movable, C. D. Young	927,628
Lathe stock, turret, or the like, controlling mechanism for, F. Hardinge	928,045
Laundry articles, marking machine for, C. W. Curtis	927,487
Leather goods, S. Zeugschmidt	927,701
Leather or artificial patent leather, making patent, G. R. De Montfort	928,225
Leather staking machine table, F. F. Slocomb	[illegible]
Legging fastener, M. H. Marcus	[illegible]
Lens grinding machine, H. F. Clark	927,619
[illegible], H. C. Coltry	[illegible]
Lighting system, W. I. Bliss	927,482
Lightning arrester, Howlett & Merriam	928,049
Limb, knee joint for artificial, J. H. Jepson	927,871
Liquid cooling apparatus, F. Bauer	927,765, 927,766
Liquid dispenser, S. Lippstadt	[illegible]
Liquid fuel heating burner, M. Greats	927,851
Liquid receptacle locking and controlling device for, J. G. Williams	927,921
Liquid separator, centrifugal, I. L. Kimball	928,150
Liquids, apparatus for filling receptacles with, D. Landau	927,983
Liquids, regulator for the flow and level of, I. Sutherland	927,880
Lithographic stone, artificially manufactured, J. M. Thom	927,872
Locomotive attachment, C. F. West	928,091
Loom shuttle, I. Shaw	928,077

Classified Advertisements

Advertising in this column is 75 cents a line. No less than four nor more than ten lines accepted. Count seven words to the line. All orders must be accompanied by a remittance. Further information sent on request.

READ THIS COLUMN CAREFULLY.—You will find inquiries for certain classes of articles numbered in consecutive order. If you manufacture these goods write us at once and we will send you the name and address of the party desiring the information. There is no charge for this service. In every case it is necessary to give the number of the inquiry. Where manufacturers do not respond promptly the inquiry may be repeated.

MUNN & CO

BUSINESS OPPORTUNITIES

WANTED.—Manufacturer to handle match box and automatic cigar-tip cutter (Patent No. 924,611) on royalty. Nothing like it patented. Write for model. Address G. J. Buckman, 217 B St. N. E. Washington, D. C.

Inquiry No. 8888.—Wanted to buy nickeloid for buttons.

WANTED by established manufacturers of metal specialties, patents of metal specialties which could be sold to the carriage or hardware trade. Answer, giving full description, Cately & Ettling, Cortland, N. Y.

Inquiry No. 8918. For manufacturers of "Wydt's Electro-Catalytic Sparking Plug."

PATENTS FOR SALE

FOR SALE.—Patent No. 918,612. Self timing speed indicator. A most improved instrument. Center runs idle till clutch is thrown in. When revolutions for the desired time are registered it will disconnect automatically, thus no watch is needed nor light. One hand can operate it, which is convenient for shafts near floor or ceiling. Simple in construction and cheap to manufacture. K. Weiss, 118 Cherry St., Waterbury, Conn.

Inquiry No. 8921. For the manufacturers of gilt paper.

FOR SALE. Patent No. 886,612. Revolving wrench is a parallel jaw pliers with revolving handles, which will grip tight or revolve loose as desired in either direction. Very quick motion for turning screws, nuts, etc. Have many requests to put this wrench on the market. K. Weiss, 118 Cherry St., Waterbury, Conn.

Inquiry No. 8924.—Wanted the address of Worthington Boiler Co.

FOR SALE. Patent No. 921,898. Just issued. Can be made the biggest little thing going. Demand already created. Small cost to manufacture. Address Inventor, No. 2118 Whittemore Place, St. Louis, Mo.

Inquiry No. 8931.—For parties who manufacture the Western Stump Borer for boring stumps.

FOR SALE.—Rights under U. S., French and Italian photo-sculpture patents. A device of extreme accuracy, yet flexible. See Scientific American July 10. J. Hammond Smith, University of Pittsburgh.

Inquiry No. 8941. For manufacturers of machinery for making fly screens.

FOR SALE.—U. S. Patent No. 885,761, France, No. 384,241, England, No. 19,138. Steel railway joint. No fish plates needed. Sure money maker. No reasonable offer refused. Address Wilbur H. Reel, Pennsgrove, N. J.

FOR SALE

FOR SALE.—Specialty for manufacturers. Dental floss holder patented May 1909. For further particulars apply direct to inventor, T. A. Tubbs, Seattle, Wash., care H. S. Emerson Company.

Inquiry No. 8960.—For the address of the Windsor Mfg. Co., manufacturers of waterproof collars and cuffs.

HELP WANTED

YOUNG MAN graduate of some school in mechanical engineering for position in woodworking plant in small Tennessee town. Good opportunity for advancement. State experience, if any, and salary. Answer "Position," Box 773, New York.

Inquiry No. 8966. Wanted the address of the Cohendet Motor Co.

LISTS OF MANUFACTURERS

COMPLETE LISTS of manufacturers in all lines supplied at short notice at moderate rates. Small and special lists compiled to order at various prices. Estimates should be obtained in advance. Address Munn & Co., List Department, Box 773, New York.

Inquiry No. 8969. Wanted machines that make accordion dress plaiting (steam).

A LIST OF 1,500 mining and consulting engineers on cards. A very valuable list for circularizing, etc. Price $15.00. Address Munn & Co., List Department, Box 773, New York.

Inquiry No. 8971. For address of firms interested in fishing reels.

Inquiry No. 8977. For manufacturers of machinery for manufacturing denatured alcohol.

Inquiry No. 8978. Wanted the address of manufacturers of dry pans or crushers to grind sand for plastering and cement works.

Inquiry No. 8980. For the address of manufacturers of mortars and pestles that are used by druggists.

Inquiry No. 8981. Wanted the address of the manufacturers of Cypress wash tub.

Inquiry No. 8987. Wanted the manufacturers of the Van Winkle Woods & Sons and the Weber power motors.

Inquiry No. 8990. For information regarding shoes not made of leather but similar to the same and are as durable.

Inquiry No. 8996. Wanted addresses of manufacturers of machinery for working orange wood manicure sticks.

Inquiry No. 8997. Wanted the address of the manufacturers of bread or cake boxes.

Inquiry No. 8999. For manufacturers of combined clothes and clothes pin receptacle.

Inquiry No. 9001. For the address of progressive manufacturers of fruit jars.

Inquiry No. 9003.—For the address of parties who make "Invar" or other metals having a low coefficient of expansion.

Inquiry No. 9004. Wanted to buy machinery suitable for grinding, sifting and preparing cooked cereals; also packing same in cartons.

Inquiry No. 9005.—For the address of manufacturers of 4 oz. cylindrical paper boxes.

Inquiry No. 9006. Wanted to buy a machine that will sew or clamp a thin two-ply wood cover on to the top of a bushel basket, wiring and sealing it quickly by power machinery.

Inquiry No. 9007.—Wanted, a tin churn for churning milk that has a wire spring at top and bottom of churn and operated by pressing the wire springs.

Inquiry No. 9008.—For manufacturers making a specialty of match boxes.

Schools and Colleges

Mackay School of Mines

University of Nevada

Best equipped mining school in the country—all buildings of special construction. Faculty composed of prominent engineers and every department in charge of experienced instructors. Located close to great mining district—students obtain both wages and practical experience during vacations. Splendid climate—every opportunity for outdoor life amid beautiful surroundings. Regular term opens August 23rd. For detailed information address

JOSEPH E. STUBBS, President Reno, Nevada

Rose Polytechnic Institute, Terre Haute, Indiana

A College of Engineering. Courses in Mechanical, Electrical, Civil and Chemical Engineering and Architecture. Extensive Shops, well equipped Laboratories in all departments. Expenses low. Twenty-sixth year. For Catalogue containing full information and professional register of alumni, address C. L. MEES, President.

Learn Watchmaking

We teach it thoroughly in as many months as it formerly took years. Does away with tedious apprenticeship. Money earned while studying. Positions secured. Easy terms. Send for catalog.

NOW READY

The Design and Construction of Induction Coils

By A. FREDERICK COLLINS

8vo. 295 Pages and 160 Illustrations, made from original drawings made especially for this book

PRICE $3.00

Reduced Fac-simile Intermediate Sized Induction Coils. Completed, 4, 6, or 8 inch Coil.

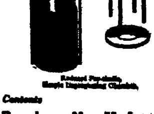
THIS work gives in minute details full practical directions for making eight different sizes of coils, varying from a small one giving a ½-inch spark to a large one giving 12-inch sparks. The dimensions of each and every part down to the smallest screw are given and the descriptions are written in language easily comprehended.

Much of the matter in this book has never before been published, as, for instance, the vacuum drying and impregnating processes, the making of adjustable mica condensers, the construction of interlocking, reversing switches, the set of complete wiring diagrams, the cost and purchase of materials, etc. It also contains a large number of valuable tables, many of which have never before been published.

It is the most complete and authoritative work as yet published on this subject.

Following is a list of the chapters:

I. The Development of the Induction Coil.
II. Theory of the Induction Coil Simply Explained.
III. Some Preliminary Considerations.
IV. Forming the Soft Iron Core.
V. Winding the Primary Coil.
VI. The Insulation Between the Primary and Secondary Coils.
VII. Winding the Secondary Coil.
VIII. Winding the Secondary Coil (continued).
IX. Vacuum Drying and Impregnating Apparatus.
X. Constructing the Interrupter.
XI. Building up the Condenser.
XII. Adjustable Mica Condensers.
XIII. Reversing Switches and Commutators.
XIV. Spark-Gap Terminals and Other Fittings.
XV. The Base and Other Woodwork.
XVI. Wiring Diagrams for Induction Coils.
XVII. Assembling the Coil.
XVIII. Sources of Electromotive Force.
XIX. The Cost and Purchase of Materials.
XX. Useful Tables, Formulas, Symbols, and Data.



Reduced Fac-simile, Simple Impregnating Chamber.

Send for full Table of Contents

MUNN & CO., Publishers, 361 Broadway, New York

Home-Made Experimental Apparatus

In addition to the following articles, the Scientific American Supplement has published innumerable papers of immense practical value, of which over 17,000 are listed in a carefully prepared catalogue, which will be sent free of charge to any address. Copies of the Scientific American Supplement cost 10 cents each.

If there is any scientific, mechanical, or engineering subject on which special information is desired, some papers will be found in this catalogue, in which it is fully discussed by competent authority

A few of the many valuable articles on the making of experimental apparatus at home are given in the following list:

ELECTRIC LIGHTING FOR AMATEURS. The article tells how a small and simple experimental installation can be set up at home. Scientific American Supplement 1551.

AN ELECTRIC CHIME AND HOW IT MAY BE CONSTRUCTED AT HOME, is described in Scientific American Supplement 1566.

THE CONSTRUCTION OF AN ELECTRIC THERMOSTAT is explained in Scientific American Supplement 1566.

HOW TO MAKE A 100-MILE WIRELESS TELEGRAPH OUTFIT is told by A. Frederick Collins in Scientific American Supplement 1605.

A SIMPLE TRANSFORMER FOR AMATEUR'S USE is so plainly described in Scientific American Supplement 1572 that anyone can make it.

A ¼ K.-W. ALTERNATING CURRENT DYNAMO. Scientific American Supplement 1558.

THE CONSTRUCTION OF A SIMPLE PHOTOGRAPHIC AND MICRO-PHOTOGRAPHIC APPARATUS is simply explained in Scientific American Supplement 1574.

A SIMPLE CAMERA-SHUTTER MADE OUT OF A PASTEBOARD BOX, PINS, AND A RUBBER BAND is the subject of an article in Scientific American Supplement 1578.

HOW TO MAKE AN AEROPLANE OR GLIDING MACHINE is explained in Scientific American Supplement 1582, with working drawings.

EXPERIMENTS WITH A LAMP CHIMNEY In this article it is shown how a lamp chimney may serve to indicate the pressure in the interior of a liquid to explain the meaning of capillary elevation and depression to serve as a hydraulic tourniquet an aspirator and intermittent siphon to demonstrate the ascent of liquids in exhaustive tubes to illustrate the phenomena of the bursting bladder and of the expansive force of gases. Scientific American Supplement 1569.

HOW A TANGENT GALVANOMETER CAN BE USED FOR MAKING ELECTRICAL MEASUREMENTS is described in Scientific American Supplement 1584.

THE CONSTRUCTION OF AN INDEPENDENT INTERRUPTER. Clear diagrams giving actual dimensions are published. Scientific American Supplement 1615.

AN EASILY MADE HIGH FREQUENCY APPARATUS WHICH CAN BE USED TO OBTAIN EITHER D'ARSONVAL OR OUDIN CURRENTS is described in Scientific American Supplement 1618. A plunge battery of six cells, a two-inch spark induction coil a pair of one-pint Leyden jars, and an inductance coil, and all the apparatus required most of which can be made at home.

SIMPLE WIRELESS TELEGRAPH SYSTEMS are described in Scientific American Supplements 1360 and 1381

THE LOCATION AND ERECTION OF A 100-MILE WIRELESS TELEGRAPH STATION is clearly explained with the help of diagrams, in Scientific American Supplement 1622.

THE INSTALLATION AND ADJUSTMENT OF A 100-MILE WIRELESS TELEGRAPH OUTFIT, illustrated with diagrams, Scientific American Supplement 1623.

THE MAKING AND THE USING OF A WIRELESS TELEGRAPH TUNING DEVICE, illustrated with diagrams, Scientific American Supplement 1624.

HOW TO MAKE A MAGIC LANTERN Scientific American Supplement 1546.

THE CONSTRUCTION OF AN EDDY KITE. Scientific American Supplement 1555.

THE DEMAGNETIZATION OF A WATCH is thoroughly described in Scientific American Supplement 1561.

HOW A CALORIC OR HOT AIR ENGINE CAN BE MADE AT HOME is well explained with the help of illustrations, in Scientific American Supplement 1573.

THE MAKING OF A RHEOSTAT is outlined in Scientific American Supplement 1594.

Good articles on **SMALL WATER MOTORS** are contained in Scientific American Supplement 1494, 1049, and 1406.

HOW AN ELECTRIC OVEN CAN BE MADE is explained in Scientific American Supplement 1472.

THE BUILDING OF A STORAGE BATTERY is described in Scientific American Supplement 1433.

A SEWING-MACHINE MOTOR OF SIMPLE DESIGN is described in Scientific American Supplement 1210.

A WHEATSTONE BRIDGE, Scientific American Supplement 1595.

Good articles on **INDUCTION COILS** are contained in Scientific American Supplements 1514, 1522, and 1527. Full details are given so that the coils can readily be made by anyone

HOW TO MAKE A TELEPHONE is described in Scientific American Supplement 966.

A MODEL STEAM ENGINE is thoroughly described in Scientific American Supplement, 1527

HOW TO MAKE A THERMOSTAT is explained in Scientific American Supplements 1561, 1563, and 1566.

ANEROID BAROMETERS, Scientific American Supplements 1500 and 1554.

A WATER BATH, Scientific American Supplement 1464.

A CHEAP LATHE UPON WHICH MUCH VALUABLE WORK CAN BE DONE forms the subject of an article contained in Scientific American Supplement 1598.

Each number of the Scientific American Supplement costs 10 cents by mail.

A printed copy of the specification and drawing of any patent in the foregoing list, or any patent in print issued since 1863, will be furnished from this office for 10 cents, provided the name and number of the patent desired and the date be given. Address Munn & Co., 361 Broadway, New York.

Canadian patents may now be obtained by the inventors for any of the inventions named in the foregoing list. For terms and further particulars address Munn & Co 361 Broadway New York.

"CASTELL"

Drawing, Copying and Ink Pencils

are the finest production of a house that has been manufacturing the highest grade lead pencils for 148 years; and has earned a reputation for excellence that has made the name of A.W. FABER famous all the world over. Sold by all stationers and dealers in artists' and drawing materials.

Samples worth double the money will be sent you on receipt of 10c.

A. W. FABER 49 Dickerson Street, Newark, New Jersey

WANTED—A·RIDER AGENT IN EACH TOWN and district to ride and exhibit a sample 1910 Model "Ranger" bicycle furnished by us. Our agents everywhere are making money fast. *Write for full particulars and special offer at once*

NO MONEY REQUIRED until you receive and approve of your bicycle. We ship to anyone, anywhere in the U. S. *without a cent deposit* in advance, *prepay freight*, and allow TEN DAYS' FREE TRIAL during which time you may ride the bicycle and put it to any test you wish. If you are then not perfectly satisfied or do not wish to keep the bicycle you may ship it back to us at our expense and *you will not be out one cent*.

FACTORY PRICES We furnish the highest grade bicycles it is possible to make at one small profit above actual factory cost. You save $10 to $25 middlemen's profits by buying direct of us and have the manufacturer's guarantee behind your bicycle. DO NOT BUY a bicycle or a pair of tires from *anyone* at *any price* until you receive our catalogues and learn our unheard of *factory prices* and *remarkable special offers* to rider agents.

YOU WILL BE ASTONISHED when you receive our beautiful catalogue and study our superb models at the *wonderfully low prices* we can make for you. We sell the highest grade bicycles for less money than any other factory. We are satisfied with $1.00 profit above factory cost. BICYCLE DEALERS, you can sell our bicycles under your own name plate at double our prices. Orders filled the day received.

SECOND HAND BICYCLES. We do not regularly handle second hand bicycles but usually have a number on hand taken in trade by our Chicago retail stores. These we clear out promptly at prices ranging from $3 to $8 or $10. Descriptive bargain lists mailed free.

TIRES, COASTER-BRAKES, single wheels, imported roller chains and pedals, parts, repairs and equipment of all kinds at *half the usual retail prices*.

DO NOT WAIT, but write today and we will send you free by return mail our large catalogue, beautifully illustrated and containing a great fund of interesting matter and useful information; also a *wonderful proposition* on the first sample bicycle going to your town. It only costs a postal to get everything. Write it now.

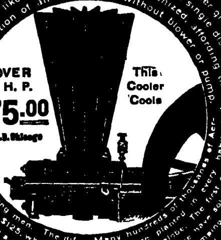
CH BESLY & CO CHICAGO ILL. U.S.A

We believe we now offer for $75 the best 2 H.P engine made, built throughout with most painstaking care for those not expert. Its hopper cooler gives large radiating surface, in the best possible shape made of a single disc of sheet steel, folded in like an umbrella, and galvanized, affording thorough circulation of air and water without blower or pump.

This gasoline engine, complete, on skids, with batteries, ready to start in 15 minutes.



OVER 2 H. P. $75.00 F.O.B. Chicago

This Cooler Cools

We employ no traveling men. The difference between $75 and $125, what others charge, is the cost of sending a man to induce you to pay the higher price. Aermotor goods are made so well that they sell themselves. Where one outfit goes others follow and "we take the country."

Many hundreds of thousands of Aermotors are planted in every habitable portion of the globe. The first ones sold the others. In a year we have sold many thousands of our little $37.50 pumping engines, which can be attached to any old hand pump in fifteen minutes.

If interested, cut this "circular" Ad out and preserve it. It will not appear again.

BLERIOT'S CHANNEL FLIGHT

History is making fast these days in the world of aeronautics and the dramatic flight of Bleriot across the English Channel has set a milestone of progress which must forever be memorable No one surely would be so unjust as to belittle this great performance by reference to earlier and longer flights over the land In point of risk and daring that bold, early morning dash across the Channel stands in a class by itself Quite apart from its spectacular features there are serious reasons, well understood by the aeronaut, why a flight across a twenty mile arm of the sea, edged on either side by cliffs hundreds of feet in height is a more hazardous undertaking than a flight in a closed circle over chosen ground or even a straight-away dash across country between starting and alighting places which have been already selected In a land flight the aeroplane rises gradually from the ground the height at which the aeronaut will travel is a matter of choice and it may be attained by gradual ascent So also in landing the descent is a matter of gradual control In the cross-Channel flight however, the aeroplanist immediately after the start must launch himself out from cliffs several hundred feet high and find the distance between himself and the earth's surface increased suddenly by that amount Should his motor fail during the twenty one-mile stretch of the course he must forthwith make a swift swoop into the sea where in spite of the fact that Latham has twice been rescued the chances of disaster are very great indeed The speed of the aeroplane is so much greater than that of an attendant torpedo boat that the latter is quickly left behind and when the aeroplane is once in the water it is merely a question of the flooding of the hollow wings and central body, before the weight of the motor tanks and chassis to say nothing of the operator will submerge the whole machine

The Wright brothers have described in a paper before one of the technical societies the great agitation of the lower strata of the air caused by the uneven surface of the ground where trees hills buildings and other obstructions cause the air in contact with it should a wind be blowing to roll in billows and swirl in eddies in much the same way as the waves break on the shore or as water is thrown into commotion when flowing in a cataract over a rocky river bed Bleriot encountered these atmospheric billows as he passed from sea to shore above the lofty cliffs of Dover where his machine was described as having been driven violently from its true line of flight

The fact that the first machine to cross the Channel was a monoplane has raised the prestige of that type Throughout his experimental work Bleriot has made almost exclusive use of the monoplane and although recently he has done some work we believe with the biplane the fact that he selected his favorite machine for the great venture would seem to indicate that he considers it at least at the present stage superior to a multiplane flier On the other hand it should be remembered that the other notable success of this memorable week in the history of aviation when a flight of 1 hour 1- minutes 6 seconds with a passenger and a speed test of 10 miles across country were made by Orville Wright in the government tests at Fort Myer was achieved with that biplane type of machine with which the brothers ushered in the era of practical aeroplane flight

GRANDEUR OF THE HUDSON FULTON NAVAL PARADE.

Of the many imposing pageants that will lend interest and dignity to the Hudson Fulton Celebration the most notable will be the great naval parade with which the week of festivities will open It is difficult to say whether this stately procession will be richer in historical or in contemporary interest. The presence in the van of that stately column of the 'Half Moon and the Clermont absolute replicas, as they are, of the quaint little sailing craft of Hudson and of Fulton's epoch making steamboat will in itself form an attraction that should prove sufficient to draw hundreds of thousands of patriotic lovers of their country's history to the shores of the Hudson River Yet without disparaging the rich historic interest of these two vessels it is certain that the spectacular we had almost said dramatic element of the naval parade will be furnished by the vast assemblage of modern warships which gathered from every naval country of importance in the world, will follow in the lead of the two vessels of 1609 and 1807

So successful have been the efforts to make the military features of the naval parade worthy of the occasion that it is now certain the fleet of warships will be the largest if we except the rendezvous of British ships in the English Channel that has ever been gathered together Including the foreign representatives there will be eighty war vessels, and of these, fifty three will fly the flag of the United States The dominant feature in the United States fleet will be the sixteen battleships which last year made the circuit of the world It is to be hoped that among the battleships will be the South Carolina and Michigan ' the first vessels of the Dreadnought ' type to be built for the United States navy An effort should certainly be made to place these vessels at the head of the naval section The other battleships of the fleet will possess special interest from the fact that they will appear with the curious latticework or basket" masts, with which the ships of the North Atlantic squadron have now been equipped The fleet will come down from the rendezvous off Provincetown Cape Cod, where it is now engaged in the summer maneuvers and every ship will be in the very pink of condition and tuned up to the highest pitch of excellency in training and equipment. As the crowds look upon this stately line of battleships they will be able to more fully appreciate the enthusiasm which it awakened in the various ports throughout the world at which a call was made Following the battleships will be three of the latest armored cruisers vessels 500 feet in length and of 22 knots speed the three scout cruisers of the speed trials of which so much has lately been said and written the fastest of which are good for 25 and 26 knots maximum speed The torpedo-boat division will contain twelve torpedo boats and four submarines Associated with these will be the two cruisers Dixie and Castine whose duty it is to act as mother ships to the small craft The rest of the naval fleet will be made up of the tender Yankee , two supply ships, Celtic and Culgoa' the repair ship Panther fitted internally with forges and a complete machine shop besides seven colliers and a tug and torpedo vessel The total number of ships in the fleet, as given above is fifty three and it is possible that certain auxiliaries will be added before the final list is made up

Not only will this be the largest collection of war vessels ever assembled on this side of the Atlantic but it will be the largest fleet of an international character that has yet been gathered either here or in Europe England will be represented by four armored cruisers, the 'Drake," which it will be remembered was the flagship of the Atlantic squadron which visited this country a few years ago under Prince Louis of Battenberg the 'Duke of Edinburgh' and the Black Prince two of the latest of the pre-Dreadnought" armored cruisers and the "Argyll,' a smaller armored cruiser of earlier date This squadron will be under the command of Rear Admiral Hamilton The German government has notified the Department that it will send a squadron probably of four vessels under the command of the ranking officer of the German navy Admiral Von Koester This squadron will probably include the four powerful and modern cruisers of the Scharnhorst' and Roon" classes and they will afford visitors to the celebration an opportunity to see some of the latest German cruisers prior to the introduction of the Dreadnought" type France will send a squadron of battleships under an admiral of the navy The flag of Italy will fly from the cruiser 'Etruria' and her cadet ship Aetna The Netherlands will send the cruiser Utrecht (a part of whose crew will man the Half Moon) and probably two or three other war vessels It is also expected that South America will be represented by five warships, and Japan although she will have no vessels in the parade will send a member of the Royal House, Prince Kunihiko of Kuni, to act as the official representative of that country

LEFFERT LEFFERTS BUCK.

The sudden death from apoplexy at his home in Hastings-on Hudson N Y on July 17th of Leffert Lefferts Buck has removed one more of the race of bridge engineers who by their work during the past few decades have made America famous as the country of long-span bridges. Mr Buck who was best known in this city as a former chief engineer of the Bridge Department New York, was born in Canton, New York, in 1837 His early schooling was received in the Canton Academy which he left before the completion of the course to serve an apprenticeship as a machinist. In 1859 he entered St Lawrence University, but at the outbreak of the war, two years later enlisted as a private in the 60th New York Volunteers. After serving through the war he was mustered out in 1865 with the rank of captain He then entered the Rensselaer Polytechnic Institute from which he graduated in 1868 The early years of his engineering practice included some notable work in Peru, where he was connected with the construction of the famous Verugas Viaduct on the Lima & Oroya Railroad In later years he replaced this bridge with a cantilever structure He also built a suspension bridge over the Santa River in northern Peru After his return to the United States in 1873 Mr Buck entered the Mechanical Department of the Illinois Central Railroad One of the works with which his name will always be honorably associated was the rebuilding of the International Suspension Bridge at Niagara Falls. First reinforcing the anchorages he gradually rebuilt the suspended structure and replaced the stone piers with steel towers the whole of the work being done without interruption of the traffic In 1881 he became resident engineer of the Central Railroad of New Jersey, and his work at this period includes the construction of a number of truss bridges of the Northern Pacific Railroad and large bridge across the Willamette River in Oregon Two of his finest structures are the steel arch which took the place of the old Clifton suspension bridge at Niagara and the steel arch railroad bridge across the river at the head of the Whirlpool Rapids. In 1895 he was made chief engineer of the Bridge Department, and became responsible for the construction of the Williamsburg Bridge, the longest suspension bridge in existence Mr Buck was a member and director of the American Society of Civil Engineers a member of the Loyal Legion of the Military Service Institute of the Burns Society, and of the Engineers' and Century clubs.

AN ANTIQUE ENCYCLOPEDIA

A quite recent record of the aggregate results of the investigation of papyri states that Berlin, through its fortunate acquisition of certain of these documents has come to share a cherished precedence A late number of the Sitzungs-Berichte of the Berlin Academy speaking especially of the papyri in Germany says First we had the Persians of Timotheos, then the Didymos commentaries on Demosthenes, together with many other fragments of Greek poetry and prose and to-day we have a very remarkable text indeed It is written on a leaf that formerly was wound around a mummy It was unrolled from the body without receiving the slightest injury Through the style of the letters used on it it is traced to the second century B C

In the text mention is made in formal order of legislators painters sculptors architects, and mechanics. Only the most prominent representatives of the professions and trades have been selected and frequently the particular achievement is stated to which the representative owes his fame Following these the seven wonders of the world the largest islands, the highest mountains the longest rivers and the most beautiful fountains are enumerated

The text which is concluded with these, is only an extract from a larger work which in its turn, is based on the results of Alexandrine investigation How fragmentary the transmission to us of these results formerly was is shown by the fact that not seldom we read mention of new texts and of new men. We are told for instance of a certain Phœnician, Abdaraxos who is said to have produced the objects of mechanical art found in Alexandria, and of one Dorion who invented an engine of war that bore the appropriate name The Ender of War

The greatest significance of the new find lies in the fact that it answers the question, what men in antiquity were known as classics in their art, with new and authentic information

◆

According to press dispatches, an inventor named Frank Russak has devised a machine for the benefit of that large public eager to hire a book for a few hours' reading without the trouble of going to a circulating library These machines are said to hold ten or twelve books, and display their titles so that they can be read without being removed from the case This case opens only when a certain coin is inserted in the slot as the price of hire Another coin is inserted in another slot as the price of the book, should the reader desire to keep it. The machines are to be distributed in hotels, trains, and seaside resorts, and wherever there is likely to be a demand for books to while away an hour or two.

ENGINEERING.

Some details have lately been made public of the engineering work on the Gunnison tunnel, recently completed by the government, which will bring some 200,000 acres of land under cultivation The tunnel from entrance to entrance is six miles in length The survey lines at the point of meeting differed 0 32 foot in level, 0 04 foot in alignment, and 0.36 foot in distance.

For two years past the Pittsburg & Lake Erie Railroad has been testing a car wheel that was designed by the chief engineer of the Carnegie Steel Company Although the Pittsburg & Lake Erie Railroad carries an unusually heavy freight traffic the wheel has stood up so well under the trying service that the company has announced that it will build a $3 000 000 plant at Homestead for the exclusive manufacture of the new wheel.

Rumor has it that another long step forward has been made in the art of armor plate manufacture It is stated that the new plate which is fabricated from a steel alloy combines great toughness with extreme hardness of face and that in a recent test a 6 inch plate stopped a 9-inch capped explosive shell We doubt it but if it was done the new armor must be even more superior to Krupp armor than Krupp armor is to that made under the old Harvey patents

During the month of June the total excavation on the Panama Canal was 2 895 798 cubic yards which is slightly less than the total for the month of May The mean rainfall was 11 85 inches for the month as compared with 9 82 inches in May There were 366 996 cubic yards of material placed in the Gatun Dam and 10 668 cubic yards of concrete were laid in the floor of the spillway

The advantage of having the White Star Line steamers call at Holyhead was shown on a recent trip of the Cedric when mails and passengers were landed at 1 30 P M and reached London at 7 15 P M Those passengers who went on to Liverpool were not disembarked until 10 P M being detained by the state of the tide in the Mersey The passengers who landed at Holyhead therefore reached London three hours before their fellow passengers were landed in Liverpool

So rapid has been the extension of block signaling on the lines of the Pennsylvania Railroad Company that they have established signal schools to train men specially for the signal service Apprentices serve a three years course The first year is spent in mechanical work with the construction gangs the second year in the office of the supervisor of signals and the third year will be devoted to outside work on electric and other signal appliances

Some idea of the scale of the Hudson Fulton river parade may be had from the fact that over 800 vessels big and little are expected to take part in it The Atlantic ports from New England to Norfolk have been drawn upon for reinforcements and it is stated that not a single licensed passenger steamer remains unchartered for the opening day September 25th

Another shocking submarine disaster has happened this time in the British navy The cruiser Bonaventure was conveying a flotilla of eight submarines when the cargo steamer Eddystone ran through the flotilla ramming the submarine C 11 and sending her to the bottom Of the sixteen men in the submarine thirteen were drowned A similar accident occurred a few years ago off Portsmouth England when a submarine was struck by an outbound liner which coming up from astern ran over the craft and sent it to the bottom

If Henry Hudson could have come back in the flesh last week and seen the Half Moon' or rather a modern version of it, lifted bodily from the deck of a steamer by a floating derrick and lowered into the water, he would have realised what great strides have been taken in marine architecture during the three centuries which have elapsed since his tragic death in the waters of Hudson Bay The Half Moon looked small even beside the navy yard tugs, and seafaring men, as they looked at the tiny craft, conceived a high respect for the courage of those early navigators in submitting themselves to the perils of long voyages over boisterous seas and along shores of which no chart existed.

Much has been said of late years about the ease with which a lock canal could be destroyed by the malicious use of dynamite or other high explosive Engineering News calls attention to the fact that an attempt made in 1900 to wreck the Welland Canal in this way produced surprisingly small results After two weeks' consideration, the two men concerned selected lock 24, and each lowered a satchel containing dynamite and a fuse to the water behind the gate at each end of the lock. Both charges were exploded; but the dynamite failed to carry away the gates. Although the explosions blew a hole about 1 foot in diameter through each gate and loosened the hinges, the [illegible] [illegible] in position, holding back the water.

ELECTRICITY

The United Railways and Electric Company of Baltimore celebrated on July 26th the fiftieth anniversary of the inauguration of its street railway service This company also started one of the earliest electric car lines in the country in 1885

Canadian doctors having reported frequent cases of slight injury or strain to passengers alighting from electric cars the Toronto Railway Company at the request of the Railway and Municipal Board has made some experiments with both two and three steps below the car platform level The latter were found to project too far from the side of the car but the two-step pattern has been adopted

An electric rail grinder has been devised by the Albany & Hudson Railway for use in grinding the wing rails of frogs to insure smoother passage of car wheels A motor is carried on an ordinary hand car a sort of small barrow carrying the emery wheel being suspended from a crane overhanging the end of the car and the operator supplying the necessary pressure upon the grinding wheel through the handles of the barrow

A new use for the oscillograph is described by Mr K Simons in the Elektrotechnische Zeitschrift In the investigation of the oscillations which occur when switching off a continuous current in an inductionless circuit A record is obtained photographically showing most clearly simultaneous variations of different amplitudes It is suggested that a valuable application of the oscillograph to wireless telegraphy may be made in this way

An additional advantage claimed for electric welding of rails is the reduction of corrugation of the surface by traffic and resultant noisy riding of the cars Electric railways in Berlin Hamburg and Bremen claim that the welding of a strip of soft iron to the rail surface not only prevents the corrugation but actually reduces the noise due to corrugations already made but the experiment is not old enough to prove whether the relief is permanent

A curious accident occurred at the No 3 power house of the Niagara Falls Hydraulic Power and Manufacturing Company on Sunday afternoon July 25th by which two employees were injured The casing of one of the new 10 000-horse-power turbines burst and a large piece of casting was thrown across the station which was partly flooded by the outrush of water The turbine was under the normal head of about 165 feet of water but had been tested to a much higher pressure

The 'boosters" of the town of Montgomery Ala have erected a monster electrically illuminated sign bearing the name of their community on the roof of a factory facing the railroad The sign is 75 feet high and 85 feet long lit by 2 600 lamps and bears an immense key and the inscription Montgomery Your Opportunity with a sky rocket effect The idea is to impress the name on thousands of passengers going by on the railroad and possibly ignorant even of the name of the town

The advantages of lifting magnets for the handling of all kinds of loose material—piles of turnings and other scrap castings of awkward shape and rails etc requiring to be compactly bound in order to be handled by a crane—have won rapidly increasing recognition of late Lifting magnets are in use at the immense new plant of the United States Steel Corporation at Gary Ind capable of lifting the entire top layer of a pile of 60 foot rails lock section (alternate rails inverted so as to hang together) with an aggregate weight of 15 tons

The use of transformers as choking coils is suggested by Mr J D Coates in a paper read before the Institution of Electrical Engineers (Brit) He excites the core with direct current in addition to the alternating current and employs to prevent alternating current being induced in the direct-current circuit a second transformer inducing an E M F in the direct-current circuit equal and opposite to that induced by the first transformer Choking coils so made are used for the testing of single phase and polyphase alternators

Some interesting experiments are being conducted by the South Park commissioners of Chicago in the lighting of the boulevards under their control Several different types of lamps have been installed on temporary posts in order to observe the comparative illuminating effect and determine how high the lamps should be hung and how far apart and similar considerations The lamps under test or about to be tested include incandescent gas lamps inclosed arcs, magnetite arcs flaming arcs and incandescent tungsten lamps The commissioners hope to obtain valuable data, both as regards illumination and economy from these trials the latter being an important factor as it is estimated that 1,000 000 kilowatt hours per annum will be required for the lighting of Grant Park alone The tests are under the supervision of Mr J. A. Radford, consulting engineer to the commission.

SCIENCE.

Prof. William G Anderson, director of the Yale gymnasium is carrying on a series of experiments on the heart action of athletes More than 600 experiments have been made for the object of determining which sports exert the most harmful effect upon the heart Moreover the effect of oxygen on the heart during exertion is also being carefully studied A report is promised in October

The French parliament has passed a law which provides that in transactions relative to diamonds pearls and precious stones the term metric carat may be employed to designate a weight of 200 milligrammes (3 086 grains troy) and prohibits the use of the word carat to designate any other weight As many other governments are ready to enter into the reform and unification of the carat and have only been awaiting the initiative of France it is reasonably certain that the metric carat of 200 milligrammes will within a few months be the only carat recognized by law in the majority of countries interested in the trade in gems

Doelter has published the results of experiments on the action of radium rays on the colors of precious stones and those of dyed fabrics in atmospheres of oxygen and of nitrogen The effect of hydrogen dioxide ultra violet rays and elevation of temperature on the color changes caused by radium was also studied In these changes neither organic colors nor the rare earths played any considerable part the oxides of iron chromium and manganese being in all probability the principal factors The hypothesis that the colors like those of rock salt are due to traces of colloidal metals which are ionized by the radium rays appears worthy of consideration Most mineral dyes however appear to be unstable even the sub oxides

Modern military exercises are designed with a view of increasing the efficiency of the individual soldier The same idea is carried out in the equipment Gaudy uniforms have been replaced by dull and almost invisible tints of gray and khaki and the weight of the gun and kit has been reduced for the sake of mobility and increased ammunition-carrying capacity The art of utilizing natural cover and of maneuvering under cover is taught by long and varied practice In the execution of these maneuvers crawling or creeping is usually necessary To facilitate this movement Gustav Mueller of Stuttgart has invented and patented a device consisting of wheels rollers or runners attached to a frame or to tent poles knapsacks or other suitable parts of the equipment The utility of this invention remains to be proved by practical experience but there can be no question of its novelty and originality

A discovery of great interest has been made not long since at Pompeii where the excavation work is being steadily carried on Under the ash deposits there was found an extensive villa of a handsome construction and ornamented with very fine frescos The villa contains statues and other works of sculpture both Greek and Roman besides very rich furniture which is well ornamented and also many vases of different kinds There were also found coffers filled with gold and silver money In the basement are great amphoras which were used for storage purposes and in the triclinium the tables were prepared for a banquet of thirty persons An abundance of silverware is one of the features of the discovery and it is said to be equal in weight and artistic character to the silverware discovered in the villa of Boscoreale and now possessed by the Louvre Some of the silver pieces seem to have been taken out at a previous epoch for there are traces of clandestine search which was made at a former date

Neuberg has recently completed a comprehensive study of the changes produced in organic compounds by light These compounds in great variety were employed in the form of 5 per cent aqueous solutions containing small quantities of uranium salts which act as catalyzers probably by absorbing the luminous rays and conveying their energy in another form to the surrounding medium All of the solutions employed remained unaltered so long as they were kept in the dark but exposure to light produced a great variety of changes in color and odor and caused the formation of new chemical compounds often within a few minutes Alcohols were converted into aldehydes and acids were transformed into aldehydes and acetones containing an equal or smaller number of atoms of carbon Cane sugar and other disaccharides were inverted Glucosides were hydrolyzed or separated with absorption of water into the glucoses and the acid characteristic of each glucoside Glycerides or fats and oils were partially saponified albuminoids were partially hydrolyzed In general chemically inert substances are converted by light into chemically active compounds such as aldehydes and acetones This fact may account for the therapeutic value of light baths in certain diseases

ORVILLE WRIGHT'S RECORD FLIGHTS AT FORT MYER.

On Saturday, July 24th Orville Wright, in continuing his practice flights for the performance of the Government contract made a flight of 20½ minutes. He made this flight preparatory to taking Lieut. Lahm as a passenger, but unfortunately when descending the aeroplane was caught by a sharp air current and twisted slightly so that when it struck the ground one of the skids was broken During this practice flight Mr Wright described very small circles and performed various difficult maneuvers in order that a cinematograph operator could take photographs. The flight began at 6 56 P M and was terminated at 7 16 30 There was a light breeze of about 6 miles an hour and the aeroplane bobbed up and down considerably It also tipped at an alarming angle when making the short turns

On July 26th Orville Wright started the machine successfully without the aid of the falling weight The machine was placed upon the rail and held in position It gathered headway quickly as soon as it was released but after running off the rail it skimmed along through the grass a considerable distance before it finally rose in the air The start was made against a wind of some 15 to 18 miles an hour velocity On the first round the machine did not rise more than 25 feet, but during the remaining two and one-half circuits of the parade ground it went up to three or four times this height and the descent made in several long swoops, was quite thrilling The flight was made specially for President Taft, who for the first time visited Fort Myer for the purpose of seeing an aeroplane fly The War Department had announced that the endurance test would be made, and a crowd estimated at 10,000 people was present, but on account of the wind Orville Wright thought it best not to make the test, so he made the brief exhibition flight instead The flight was also notable for the fact that it is the first time the Wrights have publicly demonstrated in their native land that their machine can rise from the starting rail under its own power, and also that it is capable of flying in a strong wind

July 27th was the record breaking day as far as the endurance flight with a passenger was concerned At 6 36 40 P M Orville Wright and Lieut Lahm started on what turned out to be the longest flight yet made by an aeroplane carrying two men To fulfill the government contract, an hour's flight with two men was required There was no breeze of any account blowing at the time the flight began, though during the course of it a breeze sprang up which at times caused the machine to bob up and down considerably There had been a high wind all the afternoon, and just at its close there was a slight shower Subsequent to this the wind died down and it was decided to attempt a flight. As soon as the machine had been started by the falling weight, Orville Wright drove it to a good height and circled seventy-five times around the parade ground which is about 4,000 feet in circumference. Some of these circuits were smaller than others but their average was probably such that the machine traveled in all in the neighborhood of 50 miles at an average height of 75 feet At the close of the seventieth round which completed the hour in the air, there was great applause, waving of hats and handkerchiefs, and tooting of automobile horns Also when Wilbur Wright's record of 1 hour, 9 minutes, and 45 seconds was broken, the latter ran out and cheered for his brother Soon after this the machine gradually sank to a lower altitude, and finally alighted easily at the end of the seventy fifth round. Orville Wright's previous best record with a passenger was 9 minutes and 6 seconds on September 12th, 1908, when he traveled about 5 88 miles with Major Squier as passenger He had also made a 6-minute flight with Lieut. Lahm as passenger last September It is therefore quite remarkable that he was able to soar aloft with Lieut. Lahm for the first time this year on a machine which is somewhat smaller than that used before, and to remain in the air nearly an hour and a quarter without mishap The time of the flight was 1 hour, 12 minutes, and 36 seconds. The next day he hoped to complete the cross-country speed test to Alexandria, Va., and back, a distance of 5 miles each way, but owing to a strong wind and afterward to a balky motor, due, it seems, to a stoppage in the gasoline feed pipe, no flight was attempted Nor was it possible to make a flight on July 29th, for after the wind had died out at Fort Myer, and when he was about to start, word was received from Alexandria that a very strong wind was blowing, and so it was not thought best to attempt the flight.

Late in the afternoon of Friday, July 30th, Orville Wright accomplished a flight such as had never been made before by any aviator—a flight which gives without question to him and his brother the title of premier aviators of the world This was the 10-mile speed test across rough, wooded, and broken country to Alexandria, Va., and back The flight was made with a strong westerly wind blowing across the course. The wind carried the machine out of the direct line which

ORVILLE WRIGHT AND LIEUT LAHM FLYING IN THE GOVERNMENT ENDURANCE TEST AT FORT MYER, VA., ON JULY 27TH.

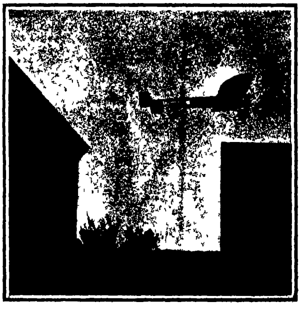
THE FIRST SUCCESSFUL CROSS-CHANNEL FLIGHT.

Six days after the first attempt at flying across the English Channel was made by Hubert Latham, M. Louis Bleriot, who had brought his "No XI." monoplane from Paris to Calais especially for the purpose, made a successful flight and landed on the English shore. The "Antoinette IV" monoplane used by Latham was so badly damaged when being pulled aboard the torpedo-boat destroyer and transported to the shore, that a complete new machine—"Antoinette VII"—was brought on from Paris and was in readiness whenever this aviator should make a second attempt. On Sunday, July 25th, M. Bleriot arose at 3 A. M. As the weather conditions seemed favorable, he examined his machine, started the motor, and, shortly after 4 A. M., made a fifteen-minute trial flight, circling for 9½ miles around Calais and its environs and landing upon the cliff from which he was to start. Everything worked perfectly and consequently, as soon as the sun had risen, he immediately climbed into his seat, had the motor started, and, speeding it to the limit, shot up over the telegraph wires and started off over the strait, heading directly for the English shore. The start occurred at 4 35 A. M. The air was clear and a southwest breeze was blowing. The torpedo-boat destroyer "Escopette" was several miles out in the Channel, headed for England also. As soon as the captain saw Bleriot coming, he put on full speed, but was soon overtaken and passed by the fast-flying mechanical bird Ten minutes after leaving the French coast the monoplane was out of sight. After passing the torpedo boat, Bleriot flew for ten minutes without steering to right or left. There was nothing to go by and flying at a forty-mile clip without compass or any other guide must indeed have been a thrilling sensation After about ten minutes of such flight the English shore came into the view of the intrepid aviator He recognized that the strong southwest wind of about twenty miles an hour velocity had carried him to the eastward He was heading toward Deal As soon as he found this out, he turned to the left, heading directly into the wind, and following the coast for two or three miles until, when within a mile or two of Dover, he turned into an opening between the cliffs. A strong wind caught him and swung him completely around, but he managed to make an abrupt descent upon suitable ground between the cliffs, where a fellow countryman was awaiting him and holding aloft the French flag The running gear and propeller were damaged, but the aviator landed without hurt, although he dropped quite suddenly from a height of 65 feet. The news had been flashed to England that Bleriot was making the crossing and there were a considerable number of people on hand to witness him make the descent. He was given a great ovation and was taken by his friends to the hotel immediately Mme Bleriot arrived on the destroyer soon after and added her congratulations when met by her husband at the pier.

M Latham overslept and was only awakened just after Blariot had left France. He attempted to follow with his Antoinette monoplane, but the strong wind that sprang up soon after caused him to change his mind. He wired congratulations and said he hoped to follow soon.

Two days later he made a second attempt in the afternoon, and this time he succeeded in traveling to within two miles of the English shore.

(Concluded on page 99.)



The No XI monoplane and M. Louis Bleriot, engineer, its designer, builder, and pilot.

The machine is shown in its ¾-hour cross-country flight of July 13th It covered 25 miles with one intentional stop at an average speed of [illegible] miles an hour.

Rear view of the Bleriot XI. monoplane making its 25-mile cross-country flight.

This is the same machine which, 12 days later, on July 25th, accomplished the record-breaking feat of flying across the English Channel in [illegible] minutes.

LOUIS BLERIOT AND HIS FAMOUS NO. XI. MONOPLANE WHICH CARRIED HIM SAFELY ACROSS THE ENGLISH CHANNEL.

ELECTRIC LAMPS IN THE MAKING.

By [illegible]

Very few persons out of the great number who are familiar with the many uses to which electricity may be put know how the bulbs are made. In the Philadelphia plant here illustrated and described, 7,000 lamps are turned out daily, and each lamp must be handled sixty-four times. Sixty four handlings seem an incredible number for so small an article. Many of the handlings are relatively unimportant to the lay man, and will be eliminated from this article.

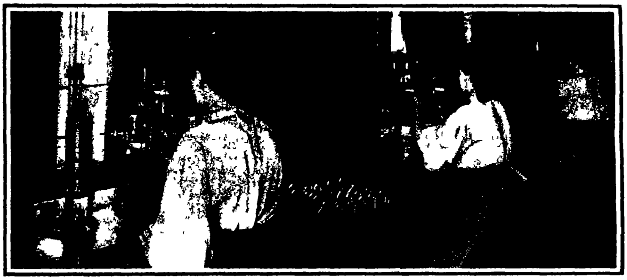
First of all, no lamp manufacturer makes his own bulbs, since only about one-half or six-tenths of the glass product of a factory is of the requisite standard for bulb making. Fortunes have been spent to bring the lead glass standard up to this requirement.

The bulb is first blown into a divided iron mold. When the "dip" or mass of nearly molten glass has been twirled a moment at the end of a tube, the operative inserts it into the mold, and gives the tube a puff of air until the glass bubble on the end fills out to the limit of the mold. An assistant reaches over and cuts the tube away from the now hardening bulb, the iron mold is divided, and the hardened glass bulb is thrown out. Its shape is about like that of a young leek or onion—much enlarged—and with the sprouts or stem nearly all cut away.

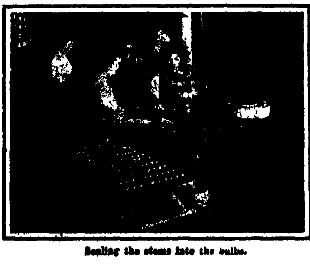
In all there are three glass parts that enter into the manufacture of a lamp. These are the bulb itself, the stem and a top tubing through which the air in the bulb is extracted. When the air has been removed and the bulb sealed, this tubing is cut off with a jet of flame and thrown away. The parts are all made by the same formula; otherwise, when heated, they would not join together. Filaments of the type in general use are made from ordinary absorbent cotton, reduced by a chloride process to a thick liquid state. By this process the silicon in the cotton is removed, leaving a residue of cellulose, which is treated for carbonization. Under air pressure this liquid is squirted through a glass die, emerging in the form of thread or string. After this fiber has been passed through a number of hardening chemical baths, it is wound on spools for drying. When thoroughly dried, it is about as strong as [illegible] string and is cut in desired lengths, [illegible] from 2½ to 7 mils. A mil is a unit used almost universally in electric wire measurements.

Treating machines for carbonization and equalization of filaments.

Pasting and straightening tables—straightening in the foreground.



The "tubulating" machines melt a hole in the top of the bulb and attach a small glass tube thereon.



Sealing the stems into the bulbs.

Placing the threaded brass collars on the necks of the bulbs.

ELECTRIC LAMPS IN THE MAKING

The next step is to form the thread in the shape desired, there being several different-shaped carbons on the market. The one in general use is known as the oval-anchored filament. Formerly a pure black carbon was used on which to form and carbonize thread, but the more recent method is to use a compressed low temperature and then, after forming, to carbonize the thread. Carbonization requires high temperature, and when the thread comes out of the oven it is pure carbon, possessing a higher resistance than any other known carbon.

From the baking oven the carbons come out jet black and about two-thirds of their original length. On account of their shrinkage and uneven air pressure when being forced through the die—and from a liquid to a stringy state—the carbons are rarely if ever, of equal diameter throughout their length. These weak spots are corrected by a process known as flashing or treating, the object of which is to make the carbons of uniform diameter and resistance throughout their length. It is not merely a question of filling up the cavities, as the provision of a uniform resistance in the carbon is of equal importance.

Carbons are treated in glass jars or vessels, electrically connected through the cover of the jars, through which a vacuum is drawn. When the vacuum has been produced, an electric current is turned through the carbons under test for the purpose of heating them. The temperature of the carbon is gradually increased until a pure carbon has been formed by the electrical vaporization of gas, derived from gasoline injected into the vessel. At this moment, when the filament under test is burning at a high temperature, the smallest parts of the filament are naturally glowing with the greatest heat. This attracts the newly introduced carbon which deposits itself in the parts of the filament possessing the greatest temperature. In this manner the cavities are filled out and the filament brought to an equal diameter throughout its length. When the filament under treatment shows the desired resistance, the current and gas flowing into the vessel are automatically cut off. After each filament has been tested and inspected it is passed on to the mounting department, where it meets a glass tube blown as a stem. This tube is flanged at one end and flattened at the other with a piece of platinum extending through the flattened end. To this platinum are joined two copper outleading wires. Platinum wire is the best material to which a filament can be attached since it has a greater power of heat resistance than any other known metal. But platinum is very expensive; its cost is seldom less than $27 an ounce and it sometimes advances as high as $42.

The carbonized filament is next attached to the platinum ends of the wire and then the stem with its wires and filaments is ready for insertion and sealing into the bulb. But before this sealing operation the stems and their filaments are again 'flashed' as a final test.

After the bulbs have been unpacked on their arrival at the lamp factory, they are washed internally with cold filtered water to remove the bluish cast which, from a cause unknown to lamp makers, comes in bulbs and must be eliminated before an undimmed light can be procured.

When the bulbs have been dried they are brought in racks of fifty to the tubulating machine, which first, by means of an air-driven jet of flame, melts a hole in the top of the bulb and, when this bulb has been set in another mechanical socket, drops a small tube through a magazine channel on the spot in the glass that was melted through. This tube and

A NOVEL TYPE OF ROTARY CONVEYER.

BY THE ENGLISH CORRESPONDENT OF THE SCIENTIFIC AMERICAN.

Various methods have been devised for the mechanical transportation of the top-soil or callow overlying iron from the excavating site to the dump. A belt or a tray conveyer is ordinarily employed Unfortunately the belt conveyer, while efficient, is somewhat expensive to install and its maintenance is costly while the tray conveyer lacks sufficient capacity

In order to overcome these deficiencies a novel type of transporter has been devised by an English engineer Mr A R Grossmith, of Kettering Northampton He has evolved a rotary type of conveyer, the general principles of which may be gathered from a reference to the front page illustrations.

Prior to the adoption of this system the method was to drive a cutting through the ore bed, along which cutting railroad tracks were laid, so as to enable the ore to be dumped straight into the cars. The greatest difficulty experienced however, was in the removal of the callow which was invariably taken out by hand from one side of the cut, and transported by wheelbarrows running over temporarily laid planks to the opposite side where the dump was formed The adoption of large steam excavators, however called for a more expeditious means of dealing with the spoil and as the conveyer did not meet the situation to the best and most economical advantage the rotary system was invented

As may be seen the transporter itself comprises a huge wheel 80 feet in diameter, built on the principle of a bicycle wheel The rim is so designed as to offer a flat table on the horizontal face which measures 3 feet 6 inches in width and which is made up of ¼ inch steel plates The vertical support on the inner side is also built up of ¼-inch plate 2 feet in depth with a diagonal strut extending from the lower end of the outer face of the vertical member to the outer under edge of the horizontal table at frequent intervals around the periphery of the wheel, to insure the rigidity and strenght of the structure In the center of the wheel is a light steelwork hub to which the rim is supported by 224 (112 top and 112 bottom) ⅝ inch steel wire radiating tension spokes disposed tangentially in precisely the same manner as in the ordinary bicycle wheel, those spokes being kept taut by means of eye bolts at the rim

The lower extremity of the hub is carried on roller bearings The mounting and balancing are such that the unloaded wheel despite its weight and size, can be turned round by hand without effort. The wheel is mounted upon a substantial pedestal carrying the driving mechanism, which in turn is carried on a heavy wheeled trolley, so that the whole machine can travel up and down the cut in either direction as desired, upon an ordinary track Moreover, the wheel can be rotated in either direction according to the forward or backward traveling motion of the machine

Probably the two most important features of the plant are the loading and discharging facilities respectively On the banks where the steam excavator works is a special form of mechanical hopper This is circular in form and consists of four essential parts A central annular disk built up of mild steel plate ⅝ inch thick by 8 feet in diameter, forms the bottom This is revolved by means of under bevel gearing Around its outer periphery is fixed a vertical stationary steel guard 2 feet in height by ¼ inch thick completely inclosing the revolving section, except at that point opposite the annular table of the conveyer wheel which is the discharge opening. There is another annular shield or ring 3 feet 6 inches in diameter disposed around the boss of the central hopper mounting This ring is only 4 inches in height and is used to take the end thrust of the scraper by means of which the material is shot on to the rotating transporter wheel This scraper or plow has its outer extremity securely held by one end of the outer vertical wall of the hopper, and stretches diagonally across the revolving base plate so that its opposite end bears against the inner thrust ring. The plow is 6 inches in height. The hopper is mechanically driven from the mechanism of the transporter wheel so that when the latter is stopped the revolution of the hopper is also brought to rest

When the steam excavator bucket deposits its charge into the hopper the material is swung round by the revolving base until it comes into contact with the diagonal plow, which deflects the stream of ballast on to the transporter wheel through the opening in the outer vertical wall of the hopper Should a greater mass of material collect at this opening than the conveyer wheel can successfully handle, because the deflecting plow is only 6 inches in height it rides over the latter, is carried round again in the hopper and is then shot out Thus the hopper can maintain a steady, uniform feed onto the rotating conveyer wheel Indeed, the uniformity of this discharge constitutes one of the most important features of the invention and is directly attributable to the design of the hopper, since its discharge can be adapted to the capacity of the conveyer to a nicety By dumping the excavated material first into the hopper instead of straight on to the wheel, there is no disturbance of the load as the shock of the shovel dump is absorbed by the hopper and is not felt by the wheel owing to its flexibility and the fact that the rim is not connected at that end of the cantilever Nor can any blocking ensue, such as, for instance, is often the case with the ordinary type of hopper, especially when dealing with wet clay

Another equally important feature is the means of discharging the material from the revolving conveyer wheel at the desired spot. This comprises a small plow which can be easily and readily moved and placed in position at any point of the annular table, even to a point well beyond the diametrical position of the hopper or in excess of 180 degrees. The plow is mounted upon a carriage and stretches diagonally right across the width of the rim table The top edge of the wheel rim is surmounted by a T bar and there are a series of roller carriages arranged to run on it and to which the plow and a ⅝ inch wire control cord are attached. The inner point of the plow holds itself in position against this bar and cannot possibly move. An angle frame serves to keep the plow face rigid and at the angle a horizontal wheel runs on the T-bar, being kept there by the pressure of the ballast, and also serves to take the back thrust against the outer point of the plow In order to prevent drag and to reduce friction the plow carriage is mounted on small wheels which engage with the surface of the revolving annular table of the conveyer The control cord is supported by carriages mounted on hardened rollers engaging with the T bar and may be varied in number as desired, but which insure the cord passing in a series of short tangents to the driving station. From this point either by paying out or winding in the cord the position of the plow can be set wherever desired, while the conveyer wheel is in operation The conveyer in its revolution carries round with it the earth it has received from the charging hopper until it comes into contact with this scraper which deflects the material off the table on to the spoil dump, and the simple means of varying the position of the discharging plow enables the spoil to be distributed evenly over a wide area. This is a most important consideration in many places, such as at Corby since afterward the spoil dumps are reclaimed for agricultural purposes, which is an easy matter when the waste has been evenly distributed in such a manner as is possible by this means The method of mounting the plow and the easy angle at which it is set serve to render it very efficient in its work, and the wear and tear upon the revolving table is practically *nil*. In fact, in one instance after the conveyer had been at work for six months continuously handling from 400 to 500 cubic yards of sandy material per day it was found that all the bloom had not been removed from the plates of which the table is built.

The large conveyer wheel is driven by a 1½ inch cotton rope which runs in a groove provided at the lower end of the vertical member of the rim table to which the spokes are attached Owing to the absence of intricate mechanism, chains, rollers, idlers, and so forth the power required to drive the installation is very small The wheel, including the hub and platform, weighing 7 tons, is carried upon a horizontal cantilever arm which in turn is carried in trunnions. By means of these latter the arm, together with the wheel, can be raised and lowered to any desired level either to suit the excavator shovel or to permit railroad trains to pass beneath to and from the mines. The heavy pedestal frame upon which the whole is mounted is fitted with a turntable, a very convenient arrangement which permits the plant to enter narrow cuttings standing obliquely thereto, independent of the direction of travel As the whole plant runs upon a three-wheel track it can be easily made to follow sideways in the track of the excavator as it eats its way into the hill, as well as follow it up and down the length of the cut. A small boiler and steam engine housed on the turntable provide the whole of the power for driving the hopper and wheel as well as propelling the conveyer along its track.

◆

Simulated Disease Revealed by Electricity.

Some cases of apparent local paralysis are feigned or simulated. For example, long after a broken arm is healed, the patient may assert that he is unable to use the arm properly It is then the duty of the physician to find whether a real paralysis exists, and where. Electrical energy may be compared to psychical energy, the battery to the brain, the wire to the nerve, and the electric bell, for example, to the member moved. A muscle contracts when a faradic current is applied to the corresponding nerve. If the muscle on the affected side of the body reacts as strongly as the corresponding muscle on the opposite side the partial paralysis is simulated. If the muscle on the wounded side reacts less strongly than its fellow there is a real disease of the nerve. Finally, if the muscle on the wounded side reacts more strongly than its fellow, the seat of the paralysis is [illegible] central nervous system, the brain or the spinal cord.

Dr. Larat has devised an instrument which makes a graphical report of the muscular contraction. The curves thus obtained form important pieces of evidence in suits of damage for accident.

The Marblehead Race for Motor Boats.

The fifth Marblehead race, which has now become an annual function and bids fair to become considered the accepted Derby of the motor boat, took place on Saturday and Sunday, July 17th and 18th. There were twelve starters and only two failed to finish, one of which was unfortunately burned and sunk.

A start was made at 10 30 A. M. on the 17th from the pier of the Crescent Athletic Club at Bay Ridge in New York bay in perfect weather which continued throughout the run, being even calmer on Sunday and interrupted only by a slight squall that afternoon.

The "Kitcinque," built specially for the race and launched only four days before, was the largest and much the most powerful boat entered, having a 75-horse-power Sterling motor, while the "Josephine," which finished first, though an inch longer, has 4 inches less beam and only one-third of the power, being equipped with a 25-horse-power Jäger engine. The former was expected to beat all records for the course and bade fair to do so, being out of sight ahead of the second and third boats when they were hull down ahead of the rest of the fleet, and it was most unfortunate that she should have been so tragically lost, keen sympathy being felt for her owner and crew, who were fortunately rescued unhurt. The "Kitcinque" was off the Sow and Pigs lightship in Vineyard Sound when a stoppage of the gasoline pipe caused the engine to back-fire through the carbureter, setting fire to oil in the bilge. Efforts to smother the flame were fruitless, and the crew were compelled to abandon their vessel, some taking to the water and others to the small dinghy carried, which would only hold three, only just in time before the gasoline tank exploded. The "Josephine" was therefore the first boat to cross the line at Marblehead six hours after the burnt boat had been expected, at 6 36 P M. on Sunday, her official time for the 285 miles run being 32 h 1 m 45 s. The second to arrive was the "Nimrod," the smallest boat entered, only 30 feet 2 inches long, with a 15-horse-power Atlantic engine, which received quite an ovation and has been highly commended, and would have been higher on the official list had she not lost an hour in putting in at Cottage City to replenish her gasoline supply The "Elmo II," which finished seventh, was the official winner on time allowance, the latter being figured on a complicated proportion of engine power to measurement, she is 34 feet 2 inches long, 8 feet 9 inches beam, and has an 18-horse-power Standard motor, and her corrected time was 25 h. 24 m 55 s. out of an elapsed time of 36 h 32 m 25 s.

The Current Supplement.

Perhaps the most distinguished physicist of our time is Prof Svante Arrhenius. A splendid portrait of Arrhenius appears on the front page of the current SUPPLEMENT, No 1758, and mention is made of his remarkable scientific work. Mr Rufus P Williams writes on an ancient duodecimal system. How a garden seat can be made is told by Mr A. C. Horth. M Kennett tells how electromagnets may be calculated It is a well recognized fact that our present railway systems are very inadequate to the demands of modern traffic. Many railway men have studied the question of reform without finding a satisfactory solution The latest proposition is that of the well-known Berlin publisher, August Scherl. Mr Scherl's plan is fully described and illustrated in the current SUPPLEMENT Lieut. John C Soley writes on the Messina earthquake and the events preceding it. Everyone remembers the old-fashioned glass globe in which a few gold-fishes led a wretched existence. In its place we now use the aquarium, which is adapted to the conditions of piscine life, and which is an adornment to any room. Some ornamental fishes that can be kept in such an aquarium are enumerated and described by Berthold Koerting. Maria Parloa tells how fruit can be canned and preserved. Zeolites are a comparatively small group of silicates distinguished by the fact that they contain water as an essential constituent. That they play an important part in the economy of plants is pointed out by Prof. O. N. Witt.

THE NUMBER OF OUR ANCESTORS.

To the Editor of the SCIENTIFIC AMERICAN

My only excuse for asking you to give more space of your valuable paper to this question is that there still seems to exist a doubt as to the location of the fallacy in the proposition that n generations ago we each had 2^n ancestors, for, as Mr Venning states, history probably justifies the conclusion that such a fallacy exists. As Mr Eakin and Mr Constable have shown, Mr. McCullough's contribution furnishes no solution to the problem. However, it contains a hint. Mr. Venning's calculation of the number of A's ancestors is based upon the assumption that the two members of every marriage among his progenitors have been totally unrelated However, had some of these couples certain ancestors in common, a reduction in the number of A's ancestors would result. And looking from Mr. McCullough's point of view, which shows well the large number of descendants ordinarily following in several generations from one couple, we can easily imagine that the marriage of distant relatives occurs with unsuspected frequency

Ithaca, N Y ROBERT KING

HOW DOES A BIRD SOAR?

To the Editor of the SCIENTIFIC AMERICAN

In regard to the question "How does a bird soar?" the writer has a theory which he has never seen in print.

Some writers claim that a soaring bird utilizes an ascending current of air which has been caused by some obstruction on the earth's surface in order to maintain a practically horizontal line of flight. The writer believes a bird creates (by the displacement of its body) a strong swell or upward pressure of air which does materially assist it in soaring flight.

Boatmen know that a swell is created off each side of a swift moving boat. A certain distance back of this swell is a trough, and following a trough a breaker appears. A full round bow will drive this swell nearly at right angles from the direction the boat is moving, a very sharp bow will send this swell away aft. These swells are all created by the displacement at the bow of the craft, and the direction of the swell will be governed by the shape of the bow and the speed of the boat. Water being a solid medium, a sudden displacement will cause a bulge in the water near the displacement, for it must follow the lines of least resistance, which in this case must be upward and outward

A bird flying through the air must displace an area of air equal to its body Air being an extremely elastic medium, an object like a bird's body (with a full breast and a hollow or concave surface in the body under the wing) passing through it will tend to compress the air and drive a large portion of it outwardly and upwardly practically at right angles to the line of flight. This compressed air will instantly expand largely in the direction in which it was driven by the displacement. The upward and outward expansion of this current will create practically the same swell in the air as the boat created on the surface of the water Or there will be a high-pressure area under the wing seeking to expand in every direction If the air above the wing is neutral and the air under the wing is compressed, say, two volumes in one, the expanding force upward will be 7 pounds to the inch. If the concave surface of the wing fits the curvature of the swell, and the bird advances its wing well toward the front of this swell, the wing will have a pitch of at least 10 deg. downward with the horizon With a slight contraction of the muscles (invisible to the eye) driving the wing backward against this air swell, the bird will be capable of keeping up a speed sufficient to cause the angle or line of expansion to follow lengthwise of the wing.

When muscular contraction can no longer keep up the necessary speed, the wing will drop backward to the top of the swell, or the swell will outrun the wing, the bird will then be compelled to flap his wings a few times, they will act as propellers to gain momentum or speed, until the wing can again take its place at the front of the swell or expanding air

A careful examination of all heavy soaring birds shows them to be full-breasted (note the pelican for instance), while all our swift, flapping-wing birds, such as pigeons, have very sharp lines. The soaring birds with their full, blunt breasts drive large swells nearly at right angles to the line of flight, while the fine, narrow-breasted birds drive their swells far backward, leaving their wings to perform their action on undisturbed air.

There is yet another point to be taken into consideration: the rear edge of all birds' wings is very thin and flexible. The diameter of the compressed body of air will be possibly two-thirds the width of [illegible] near the bird's body. It is believed that the [illegible] curve under the front edge of the wing is where the bird gets its muscular push on the air swell, tending to drive the swell backward As the air cannot expand upward through the solid concave part of the wing, it is driven backward by the new forming swell toward the rear edge of the wing. Here the flexible tips of the feathers give way to the expanding air and turn upward. This tends to drive the wing forward through the spring of the feathers as the air escapes upward at the rear

It is hoped that some of our aeronautical friends who have the necessary apparatus will experiment along the above lines and give the results of their findings to the ever anxious inventors as this may, in the end, result in a practical flying machine

W Palm Beach, Fla. C N NEWCOMB.

ELECTROCHEMICAL AMALGAMATION

To the Editor of the SCIENTIFIC AMERICAN

In recent years it has been discovered that there are large areas in southern California, Nevada, Arizona, New and Old Mexico which contain vast deposits of low-grade sands containing gold values averaging from $1 50 to $7 50 per ton Many of these deposits are of unknown depth. The values are microscopic and there is no method at present known to the miner by which the values can be profitably extracted There are also immense ledges and even mountains of low grade ore, very refractory, which cannot now be profitably mined. The sea beaches from the Isthmus to the Arctic contain vast deposits of gold bearing sands, but no practical method is known of recovering the gold, which is fine and flakey, and which cannot be saved by the usual gravity devices. In addition to these unworked gold fields, there are in California many miles of river beds containing debris and tailings from the placer mines, these tailings contain gold to the amount of $1 per ton, this amount being a low average, and the tonnage is beyond computation The values are too elusive for extraction by any of the standard processes of gold saving

In Alaska there are hundreds of miles of beach and river deposits containing vast sums of gold which is beyond the reach of the miner In the sands of the Nome beaches the miners probably left $100 000 000 in gold because the riffles would not hold the fine beach gold, and they knew of no way to save the microscopic values which are associated with the particles of black sand

There is enough gold in these various deposits to furnish ample coinage for all nations for a century and it may interest the readers of the SCIENTIFIC AMERICAN to learn something of the attempts that are being made to break into Nature's secret store of wealth

Scores of gold-saving machines working on the gravity principle have been constructed in a vain endeavor to solve the problem amalgamating devices have been tried, but the impalpable values will not adhere to the amalgam surface, and when the particles of gold are larger, it is found often that the gold is coated or rusty or oily, so that mercury has no affinity for it.

About twenty years ago tests were made with a device using electrochemical principles (see page 205 vol I, Proceedings London Inst. Min and Met) and the results were very encouraging The science of electrochemistry has made wonderful strides in the last decade, and lately the problem of saving the impalpable values I have mentioned has been approached in a practical manner by various experimenters

It has been found that the amalgamating action of mercury is greatly increased in the presence of electrochemical conditions, and devices have been constructed to utilize this fact in a commercial way The bottom of a sluice box is covered with a copper sheet or plate, suitable electrodes (anodes) are arranged so that they may come in contact with the surface of the water flowing through the device, a solution containing a definite amount of mercuric bichloride is added to the water, and a low voltage generator is connected with the anodes and the copper plate (cathode) The mercury from the solution is deposited in its nascent form on the copper plate, forming an amalgamating surface of the highest state of efficiency The electric current passing through the water (electrolyte) cleans and brightens the gold, and all unfavorable conditions are destroyed The microscopic gold particles are coated with mercury while in suspension, and the cataphoretic action of the electric current, aided by gravity forces the values into an amalgamating contact with the mercurial surface All values are deposited in the form of amalgam, which adheres tenaciously to the plate by the electroplating action of the electric current. We have an electrolytic amalgam which is smooth, firm, tenacious yet elastic and viscid. The amalgam is not dislodged, and the mercury does not "flour" All the electrochemical processes assist in cleaning the gold, forcing it to the plate, and holding the resulting amalgam in place

A current with a voltage too low to produce a shock is sufficient to give results that are marvelous, the device is so simple that its potency would never be suspected, its cost is trifling, and any electrician can make the installation Yet the percentage of extraction is so high that ordinarily the tailings contain no values of importance

Judging from numerous tests that I have witnessed there seems to be no reason why electrochemical amalgamation should not prove to be the key which will unlock the vast hidden resources of Nature and open mining fields and mining operations which will eclipse all efforts of the past Electrochemical processes have also been used in connection with lixiviation and cyanide practice and the time of treatment reduced from 24, 36, and 72 hours to 3 hours while the extraction has been raised to 99 per cent

San Jose Cal ELMER ELLSWORTH CAREY

THE TERRESTRIAL ORIGIN OF THE MOON—A PROTEST

To the Editor of the SCIENTIFIC AMERICAN

In your issue of July 17th 1909 you reprint a letter from Prof Patterson of the University of North Carolina regarding the terrestrial origin of the moon, against which I am obliged to protest Prof Patterson's views are no doubt justified by opinions heretofore adopted, but are quite inadmissible in view of my recent discoveries regarding the origin of the planets and satellites It is now proved (in A. N 4308) that not one of our planets was ever detached from the sun by rotation as very generally believed since the time of Laplace and in the same way that the satellites could not have been detached from their several planets

These conclusions were first drawn from the exact calculations based on Babinet's criterion which is simply a formulation of the mechanical law of the conservation of areas that enables us to compute the rotation period of the sun or any planet when the globe in question is imagined expanded so as to fill the orbits of the bodies revolving about it

But not content with showing that the planets and satellites could not have been detached by rotation I afterward worked out a rigorous mathematical proof of the process by which the satellites had been captured It was thus proved beyond doubt that the satellites of the solar system had originated by capture and at one time moved in independent orbits around the sun Jupiter's satellites are therefore nothing but captured planets. Though this investigation is one of extreme generality I carefully avoided reaching any conclusion in the case of our terrestrial moon till the special circumstances of the lunar terrestrial system had been investigated It was then found (1) That the moon could have been captured by the earth quite as easily as any of the satellites of Jupiter and Saturn could have been captured by those planets In fact the probability that the moon was captured, like the other satellites, was shown to be literally *infinity to one* by rigorous calculations based on the theory of probability

(2) On the other hand an independent investigation based on other phenomena showed the probability to be *infinity to one* that the earth could at no time in the past have had a rotation sufficiently rapid to detach the moon The details of these mathematical investigations have been sent to the Astronomische Nachrichten for publication and will appear very soon

It is sufficient therefore to say that the moon never had a terrestrial origin and all this terrestrial speculation is without foundation In my papers I have carefully examined the celebrated researches of Sir George Darwin and shown that he was misled by accidental coincidences As the moon never was near the earth, but is really a planet which came to us from celestial space (see cablegram of May 24th in the Astron Nachr 4335) we shall have to give up all the old views about the former rapid rotation of the earth. In the same way the mathematical investigation recently published by Prof Slichter of the University of Wisconsin in Publication 107 of the Carnegie Institution (pp 61-67) on The Rotation Period of a Heterogeneous Spheroid" is invalidated so far as concerns application to our actual earth All the bodies of the solar system have been captured, and not one of them formed by detachment from the central masses which now govern their motions Besides the investigations above referred to a further paper on this subject was presented to the Astronomical Society of the Pacific June 25th 1909

THE CHRONOSPHERE—AN EMPIRE CLOCK.

BY THE ENGLISH CORRESPONDENT OF THE SCIENTIFIC AMERICAN

The accompanying engraving illustrates an ingenious and useful horological novelty that has recently been perfected by an English inventor Mr J H Overton and which is described as an Empire clock As the name implies, it is a universal time piece for not only does it give the correct time all over the world but supplies in a glance the difference in the times between all places on the earth's surface and the correct mean time at any town or place in the eastern or western hemisphere Moreover it demonstrates the actual rotation of the earth on its axis in the twenty four hours as well as the actual speed of the earth

The clock is made in two sizes and patterns but the principle of design and operation is fundamentally the same in both instances There is a terrestrial globe inclined at 23½ degrees similar to that used in schools and suitably mounted The diameter of this glove varies from 3 to 4 inches according to the size of the clock It completes one revolution about its axis in the course of twenty four hours in the same direction as the earth itself revolves Parallel with the equator is a fixed ring dial upon which are inscribed the numerals representing the twenty four hours with sub-divisions the hours from 6 P M to 5 45 A M being engraved in black and from 6 A M to 5 45 P M in red to distinguish the twelve hours before and after meridian The meridians of longitude are 15 degrees apart When any meridian is adjusted to its own mean time all the other meridians denote their own mean time and each meridian will continue to do this correctly throughout the twenty four hours In order to determine conveniently the time at any desired spot on the earth's surface relative to another point such as New York there is an adjustable and movable guide fitted with a pointer which turns with the globe and whereby the time is indicated in the hour ring just as the hand of an ordinary clock at any place This guide is held in position by means of a small knob which enables it to be turned in an easterly direction without moving or changing the position of the globe and it can be set over any town where the chronosphere is to be permanently used As an example the clock is installed in New York and it is desired to ascertain the relative time in London when it is 12 noon in the first named city The guide is set to stop over New York and the pointer indicates this city's mean time The guide is moved eastward until it is brought over London and the hour 4 46 P M is instantly shown on the ring dial The guide is then turned eastward and brought over New York upon reaching which point it will stop and click denoting that it is over the place at which it is adjusted for permanent use when it again indicates correct New York time The guide is easily adjusted to stop over any part of the globe where the timepiece is permanently used

In the second type of chronosphere the terrestrial globe is of 8 inches diameter and it indicates the relative times between any two places In this case the globe should be secured in the manner later explained before the guide is moved For instance the chronosphere is permanently used in London It is 1 o clock there and it is desired to ascertain what would be the time in Pekin when it is 8 o clock in Vienna The pointer is set to indicate 1 o clock in London and the guide is brought over Vienna The globe is then turned together with the guide by means of the milled screw at the top of the sphere until the pointer indicates 8 o clock on the hour ring By tightening the milled screw the globe is then secured in that position so that it will not revolve in either direction—east or west—and the guide is then turned until it is exactly over Pekin Instantly the pointer indicates the Pekin time on the hour ring when it is 8 o clock in Vienna The top screw is released and the guide is carried eastward until it is brought over London when it stops The milled screw at the top of the globe is released and the latter rotated in an easterly direction until it stops itself so that the pointer once more indicates actual London time that is 1 o clock plus the minutes that the experiments have occupied in determining the relative times between Vienna and Pekin

The globe mechanism is so designed that after displacement from local time in order to carry out any such investigations as are described above it will when brought by the hand back to the local time stop itself in the correct position for the pointer to indicate actual local time once more If desired the guide can be easily adjusted for merely permanent use as in the smaller model Moreover if required a sun attachment can be fixed in position whereby the height of the sun in degrees above the horizon is shown for every day of the year This fitting renders the clock capable of more extensive use in schools and colleges The total heights of the two models are 12 and 15½ inches respectively so that they occupy but a small space It is only necessary to bear in mind that the guide and the globe must be turned in an easterly direction only and when setting time to exercise care that the guide be over the place at which it is adjusted for permanent use and that the globe has been turned eastward until it has come to a stop

For schools and colleges the clock is especially useful since it enables one to demonstrate in the concrete the daily rotation of the earth from west to east, the difference in time arising from such rotation corresponding to the difference in longtitude that is 15 deg longitude east or west one hour's difference or four minutes for each degree east or west of the standard meridian and the exact relative position of every place in the world and its exact position at any time in relation to the light of the sun that is by day or night as well as certain phases of solar phenomena by means of the sun attachment The clock requires winding only once a week and its steadiness and accuracy in running are distinctly noticeable features It should prove of marked utility to steamship and railway companies as well as to other commercial enterprises having an extensive trade overseas

THE FIGUREHEAD AND ITS STORY.

From time immemorial the seagoing vessel whether a creation of wood and hemp or of iron and steel has presented herself as an almost human individuality to the eyes of her crew From the earliest ages those little differences between craft of the same type which are only perceptible to the trained eye of the seaman were recognized to be insufficient to distinguish one individual ship from another Hence ships were variously ornamented and named by their owners and commanders who frequently adopted one of the numerous deities of heathen mythology as especial protector of their vessel and of those who intrusted themselves and their fortunes to its keeping As in almost every branch of antiquarian research we look to the ancient Egyptians for the earliest information on the subject These wonderful people were among the very first recorded ocean travelers and shipbuilding with them had at an early date quite attained the proportions of an art Many of their boats were elaborately painted and decorated and among their decorations the figurehead stands out somewhat prominently The sacred ibis the lotus, and the phœnix were favorite designs sometimes placed on the raised up prow itself and at others rather behind it as in the one illustrated Note the huge eye that is painted on the bow just below the figure This peculiar badge is very illustrative of the general feeling that a ship is endowed with a personality of its own, and in one form or another it has maintained its position on the [illegible] after century up to the present day, in which it is often seen on the bows of Maltese dyso and other gaudily painted European craft, to say nothing of its almost universal use in China. "If no have eye, how can see? asks the Chinese sailor and the expression Right in the eyes of her" is still usual afloat among our own seamen meaning as far forward in the ship as possible The ships of the Greeks and Romans preserved the "eye" on their bows and carried a distinguishing emblem or figurehead (*parasemon*) at the bow while their tutelary deities were generally given a billet at the stern All these vessels had their distinguishing devices and figureheads in addition to which those named after mountains and rivers had a lion or a crocodile respectively painted or carved in relief on either bow Numbers of representations of these may be seen on old coins

THE CHRONOSPHERE

Showing time ring pointer or hand of clock and sun attachment.

A special class of Phœnician vessels had a figurehead representing a horse and were therefore known as *hippi* the idea of riding over the sea as on horseback being evidently the origin of the adornment. It is interesting to note that in the year 113 B C one of these figureheads was found thrown up on the east coast of Africa and brought to Egypt strong circumstantial evidence that some early Phœnician mariners had already doubled the Cape of Good Hope

Ramming being the most usual form of attack among the ancients in their sea engagements the bow decoration often took the form of the head of a ram or of a wild boar the well known butting tactics of these animals rendering the figure very appropriate

When Rome in the days of her decadence lost the command of the sea the most formidable navies were those of the Scandinavian sea robbers the famous Vikings The term Viking by the way has nothing to do with the English word king as is often supposed, but is derived from *vik*, a creek or fiord and *ing* meaning the son of The word thus should be translated the sons of the fiords'—a very good descriptive name for these Norse sea rovers Their vessels—the famous long ships—were adorned with figureheads But the Viking's conception of this form of ship ornamentation started from a standpoint quite different from that of the ancients It was not so much a distinctive design or a religious emblem Its intention was to strike terror into an enemy What form of reasoning led up to it is well described by Baring-Gould in his Strange Survivals and Superstitions"

In the Egil's Saga an old Icelandic chief is said to have taken a post fixed a horse's head at the top and to have recited an incantation over it which carried a curse on Norway and the king and queen when he turned the head inland it made all the guardian spirits of the land to fly This post he fixed into the side of a mountain with the open jaws turned toward Norway These figures were called *nith stange* The *nith-stang* was primarily the head of the victim offered in sacrifice lifted up with an invocation to the god to look on the sacrifice, and in return carry evil to the house of all who wished ill to the sacrificer

The figurehead of a warship was designed in like manner to strike terror into the opponents and scare away their guardian spirits An Icelandic law forbade a vessel coming within sight of the island without first removing its figurehead lest it should frighten away the guardian spirits of the land

Here then we have the *raison d'être* of the Viking figurehead and the annexed reproduction of an old drawing in Strutt's Chronicle of England' shows not only a figurehead of this period but actually a *nith stang* in combination with it

It is obvious that the word head comes directly from the *nith-stang* and although the advent of Christianity abolished the barbarous form of witchcraft which it exemplified yet the figurehead and hence the head' of the ship remain terms in constant use to this day In the drawing referred to it will be observed that the actual bow terminates with the head and neck of some animal which is probably intended for a dragon This fabulous monster has always been a favorite emblem in all ages and from China to Wales, in both of which widely separated countries it occupies a prominent position in the national heraldry In all cases it probably has been taken as the symbol of malevolent power capable of inflicting evil upon the human race In the Bible the dragon is always represented in this light, and its wings serpent form, claws, and fire-spouting mouth render it formidable in "the air above, the earth beneath, or in the waters under the earth" With the *nith-stang* theory before us we can well understand the old Scandinavian sea-rovers being very partial to its use as a figurehead The dragon, too, from its power was also frequently adopted as a mark of chieftainship or sovereignty It was the badge of the famous King Arthur, the ensign of the Merovingians and of the Saxons at the battle of Hastings. THE FIGUREHEAD AND ITS STORY.

A Partial Solution of the Problem of Tele-Vision.

BY OUR BERLIN CORRESPONDENT

The problem of tele-vision has long been a favorite one with enterprising inventors. The many telephotographic apparatus which have been made known in the course of the last few years are the outcome of their endeavors. But the transmission of photographs drawings, and handwriting over a telegraph wire is incomparably more easy than the instantaneous rendering of the moving objects situated at the transmitting station

It is true a solution of the problem could be attempted on the very principle underlying the construction of these tele-photographic apparatus. The various sections of a picture would be produced—not successively as in the case of tele-photography but simultaneously as well as instantaneously, without any lag and would become visible immediately without any photographic process. There are two difficulties in the way of a practical realization of this idea viz. (1) the extraordinary costliness of such an outfit (2) the sluggishness or inertia of the vital organ of most systems viz the photo-electric selenium cell

Mr Ernest Ruhmer of Berlin, well known for his inventions in the field of wireless telephony and telegraphy has succeeded in perfecting what is probably the first demonstration apparatus which may be said actually to solve the problem The writer has had an opportunity of inspecting this curious machine immediately before its being sent to Brussels in order there to be demonstrated before the promoters of the Universal Exhibition planned for next year In fact a complete and definite tele-vision apparatus, costing the trifling sum of one and a quarter million dollars is to be the *clou* of this exposition The demonstration apparatus has been produced at a cost of $1 250 and by reason of its more elementary construction lends itself only to the reproduction of the pattern consisting of squares arranged in different combinations

The pattern is thrown on a screen hung on a wall, which screen is a square divided into 25 square sections Behind each of these sections is arranged a highly sensitive selenium cell in which by a novel process inertia has been eliminated so far as possible. It thus responds instantaneously to any variation in lighting it is exposed to

At the receiving station is arranged a similar screen, divided into the same number of sections each of which communicates with the corresponding section on the transmitting screen While the actual system used in transmission is kept secret this much may be stated that a highly sensitive mirror galvanometer reconverts the fluctuations of current produced by fluctuations in luminous intensity on the transmitting screen into corresponding light variations An accumulator battery supplies current to the tele-vision circuits

As soon as a perforated pattern is inserted in the projector a telegraphic reproduction of the picture appears at the very moment it is thrown on the transmitting screen The sluggishness of the cells has been overcome to such a degree that the telegraphic picture will respond practically instantaneously to any motion In fact a reproduction obtained at most in a few minutes with the photo-telegraphic apparatus so far constructed is here achieved in a fraction of a second so that several phases of a motion can be reproduced within a second

It is hard to realize what an amount of laborious work has been expended in constructing even this comparatively simple apparatus In fact each section with its selenium cell and mirror galvanometer device is an instrument of precision in itself while the final apparatus will be composed of 10,000 elements of the same kind Each selenium cell will have to be wound personally by the inventor, who never intrusts this work to anybody else

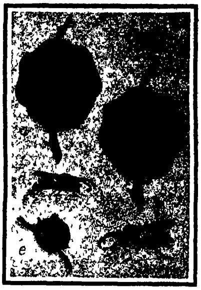
◆

Drawn glass is constantly becoming more widely employed in machine construction because of its extraordinary strength It is little affected by sudden change of temperature and resists the effect of fire, heavy loads and violent shocks Tests of the effect of loads show the great influence of the thickness of the sheet of glass a variation of 1/25 inch producing a considerable change of strength Glass broken by overloading exhibits numerous cracks radiating from the center to the edge In regard to the fire-resisting qualities official tests are made at Breslau by the following method The glass is first heated during 87 minutes, then it is sprinkled 1 minute, and receives the impact of a strong jet of water for 2 minutes. The glass is required to show no crack under this treatment Drawn glass is easily cleaned and transmits much light It is made in sheets about 1 1/3 inches thick measuring about 9 by 10 inches and 13 by 14 inches and capable of supporting, respectively, 23,000 and 30 000 pounds per square inch.

THE CEMENT WORK OF THE MUD WASPS.

BY S. F. AARON.

The cocoon-making habit is so common with insects, that there are only comparatively few species that do not possess it in some form or other It amounts simply to making use of a salivary secretion, which hardens and toughens upon exposure to the air Silk is a common illustration and the spider web is similar, though spun from the posterior of the animal Many insects spin this thread-like substance, others spread the saliva as a coating within the larval cell or boring, still others make an independent parchment like cocoon within the larval cell. Many Hymenoptera as the bees social hornets, ants mason wasps, etc., commonly employ the last method Many species of most orders use the salivary secretion as a glue, and remarkable illustrations of this can be seen in caddis fly cases under water, for the saliva is cold waterproof when hardened. An effect of warm water upon the insect salivary secretion is commonly illustrated by the reeling of silk from cocoons softened in warm water, and any insect cocoon is so affected.

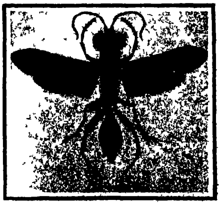


The mud mason wasps and their nest.

a is the bulky stone-like nest construction of a species of Odynerus and from which the adult wasps have escaped; *b*, same broken open showing cells within, natural size, *c*, larva, and *d*, the adult insect that makes the nest, both enlarged, the latter brown with yellow markings. The jug like single cell of *Eumenes fraterna* is shown at *e*, natural size; *f*, the wasp, much enlarged The colors are black or brown with pale yellow markings.

A broken nest of blue mud dauber wasp and the larva, pupa, and cocoons taken from it.

The nest is the work of the adult wasp. The cocoons, brown and parchment-like, are the work of the full-grown larvæ and within which they go through their further transformation.



The common blue mud dauber wasp, Pelopæus cœruleus.

The color of the insect is a bright metallic or steel blue, the wings clouded. The body is about ¾ inch long An allied species, Sceliphron cementarius, with similar habits and as common, is brown with yellow markings.

THE CEMENT WORK OF THE MUD WASPS.

The making of strong-walled, hard-baked earthen cells does not seem to be a sufficient protection for the mud mason wasps in their larval state, and hence a cocoon is spun within the mud cell. While all insect cocoons are made by the larvæ, certain adult insects possess the power to secrete saliva and use it for nest building and as a means of protection against their enemies.

The hard, compact, durable, and waterproof mud nests of the mason wasps, superior in construction to the mere hardening of mud put together when moist, was always a mystery to the writer until after watching a blue mud dauber wasp at work on the habitation for its offspring.

The wasp makes certain off motions with its head close to its work after adding the mud in its proper place, and it was evident that this was a gluing operation for the purpose of holding together the particles of earth Upon closer examination, immediately after the wasp had finished a portion of its work, it was found that the clay was slightly sticky, as if a viscid material had been mixed with it. Finding where the wasp obtained its clay, I procured a bit of this, and forced it together on a smooth surface in such a way that it would be under no strain and would naturally adhere, then dried it carefully in the air, and found that it by no means made as strong a substance as the wasp's nest. Another experiment was to drop part of a mud nest into hot water, and the other part into cold water, and note the result. The latter piece merely softened but remained intact after soaking for nearly half an hour, while the other in part disintegrated, showing the presence of the salivary secretion through the clay. Upon taking a piece of this dissolved nest and forming it as the raw clay above mentioned was formed it was found that the material adhered far more strongly when dry The salivary secretion, therefore, is probably through the clay and within the cells of certain species, and makes the lining thereof. In what manner, however, the small and slender-bodied wasp can secrete sufficient saliva to glue together the numerous particles of its bulky mud nest is beyond understanding. Waterproof animal glue in very small quantities, mixed with clay or sand, makes a material hard to surpass for the purpose needed The clay nest of a species of Odynerus saddled on a twig or vine in the woods is almost like a stone, and even harder than many sandstones, and is impervious to the water It is difficult to understand how the little wasps can burrow out of the cells when sufficiently warm weather has brought them through their transformations.

An Electric Rat Destroyer.

A new method for destruction of rats by the electric current has been lately put in use by the municipal electric station of Charlottenburg, near Berlin. The method is a patented one, and is invented by M Von Biederheim. A special kind of trap on the electric system which was constructed is said to give very good results. The current used in this case is three-phase current, working at a tension of 120 volts, which voltage seems to be sufficient to kill the rats. Direct current at 220 volts can also be employed. The animals to be destroyed, rats, mice, etc., are attracted by bait and enter the trap. By doing this they close a circuit which turns on the current. A set of wires is arranged so that they come in contact with the animals. The creatures are killed instantly There is no appreciable combustion in the present device A number of appliances of this kind can be mounted together in a large box At the electric traps it is advisable to use a method of a special contact which is put on and rings an electric bell or lights a lamp so that it can be noticed when to readjust the trap.

To Distinguish American from Russian Petroleum.

American petroleum can easily be distinguished from Galician and Russian petroleum by the action of colorless nitric acid, that is to say, acid which is not colored yellow by nitrous fumes. The acid should have a density of 1.4 and should have been freed from nitrous vapor by heating it with a little urea. Equal parts of acid and petroleum are mixed in a cylindrical glass jar provided with a ground glass stopper. The mixture is shaken violently for a minute or two, American petroleum assumes a violet color, while the acid upon which the oil floats becomes yellow. Galician and Russian petroleum, on the contrary, turn yellow and the acid becomes brown. When all three varieties are mixed together, the mixture first assumes the violet coloration, which changes suddenly to yellow after long agitation. The reaction is so sensitive that the presence of 10 per cent of Galician petroleum in American petroleum can be detected.

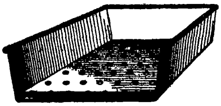
Handy Man's Workshop

HOUSEHOLD SUGGESTIONS.

AN IMPROVEMENT FOR THE BROILING PAN.

BY J. A. [illegible]

When broiling steak, chops or the like in a gas-range, the suet that is tried out from the fatty part invariably catches fire. As a rule the fat is over-heated and burns fiercely, and many efforts to put it out, when taken from the oven, fail



DOUBLE-BOTTOMED BROILING PAN

The accompanying illustration shows a very simple way to avoid this. In the pan used for broiling is placed a perforated false bottom made out of black iron of any thickness. The edges are turned down, say one quarter of an inch, forming supports for the bottom. This false bottom should be nearly the same size as the pan. On large pans, of course, the bottom should be braced with strips of iron, to prevent warping from the heat.

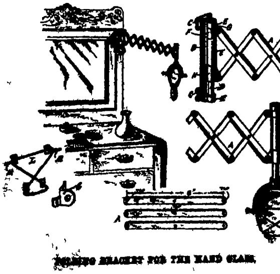
In service the suet melts, and runs down through the perforations to the bottom of the pan No matter how hot the fire, the suet will not catch fire as it is protected from the flames by thé perforated bottom which acts like the screen of a miner's lamp The bottom can easily be removed and cleaned and the suet in the pan be emptied out.

FOLDING BRACKET FOR THE HAND GLASS.

BY A. R. VAN DER VEER

A very useful adjunct to the dressing table is a small mirror, supported in such a way as to permit a person to view the side or back of the head without having to hold the glass in the hand The writer after searching the city over for an article of this character, was forced to make one for himself The task was not a difficult one, and directions are given herewith, which will enable anyone who knows anything about the use of tools to make such a bracket. Instead of having the mirror secured permanently to the bracket, it was decided to make a holder in which an ordinary hand glass could be inserted at a moment's notice. The bracket is illustrated in the accompanying drawing It is of the lazy tongs type, consisting of a series of brass links joined together after the manner of a ferryboat gate. These links are all of the same size, 6 inches long and ½ inch wide. Each of the links *A* is provided with three holes, one at the center and one at each end One set of links is provided with tapped holes at the ends only another set of equal number with tapped holes at the center only, and a third set of equal number with plain holes only

At the end which is secured to the wall, or the dresser, a half round piece *B* is provided which consists of a 1½-inch brass tube cut in two lengthwise. Plates *C* are soldered to the upper and lower ends of the piece *B* to provide lugs, through which the screws are passed that secure the bracket to its support. Two pieces of tubing are procured, one with a half-inch outside diameter, and the other a half-inch inside diameter The former is smoothed down with emery paper, so that it will slide easily into the latter A section of the smaller tube is cut to form a pintle *D*, and three pieces *E* of the latter tube are fitted on to the pintle, the whole being secured to the half tube *B* by means of screws, which pass through the sections *E* and are threaded into the pintle *D* Before the pintle is made fast a collar *F*, cut from the larger tube, is mounted thereon between the upper sections *E* To the collar *F* a lug *G* is soldered. A detail of this is shown in the drawing, and it will be seen that the base of this lug is slit to form two ears, which are bent in opposite directions, and curved to fit the surface of the collar *F* This construction provides a broad surface for soldering and is made necessary by the fact that in use this point is subjected to a great strain Between the middle and the lower sections *E* a sleeve *H* is mounted to slide This sleeve is also cut from the larger tubing A pair of lugs are soldered to this section, to receive one of the links of the lazy tongs between them It will be observed that the lazy tongs consists of pairs of links alternating with single links, the latter being the ones with the plain holes. The links are held together by machine screws, and jam nuts are used to prevent them from working loose It will be observed that the nuts for the center pivots are on one side of the lazy tongs, while those for the end pivots are on the opposite side



FOLDING BRACKET FOR THE HAND GLASS.

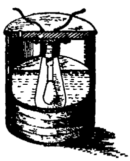
At the opposite end of the lazy tongs the links connect to a pair of sleeves of the larger tubing which slide on section *J* of the smaller tubing Sections of the larger tubing are fastened to the tube *J* by means of screws, so as to form shoulders thereon Soldered to the bottom of the tube *J* is a strap *K* which is bent to form a semicircle The mirror is supported in a wire frame *L*, which is bent to the form indicated in the drawing The upper ends of this frame are fitted with bolts *M*, soldered fast The threaded ends of these bolts pass through openings in the ends of the strap *K* A light spring on each bolt and a nut to press this spring against the strap *K* provide sufficient friction to hold the mirror at any desired angle. The hand glass may be slipped into or out of its holder at will

ELECTRIC COFFEE POT

BY HOWARD M. NICHOLS.

A simple electrically heated coffee pot can be made as follows

Procure a round tin can of about two quarts capacity This can should be about 5 inches in diameter and should be open at one end The open end should be round and smooth so that a wooden cover can be easily fitted into it



AN ELECTRIC COFFEE POT

Cover the bottom and sides of the can with heavy felt, sticking it on with shellac Put on a layer of electrician's tape over the felt and stick a piece of fiber or cardboard on the bottom Then give the whole outside of the coffee pot a couple of good coats of shellac It is very important that this part of the work be well done since if the can is not properly covered with felt, the heat generated in the coffee pot will be conducted off so quickly by the air, that it will be impossible to boil water in it.

The next step is to make a cover for the can This cover should be made from hard wood should fit tightly and should have a small hole in it to allow steam to escape A standard water-proof lamp socket should be screwed to the inner side of the cover and the leading-in wires should be brought out through small holes drilled in the cover for that purpose Each wire should be brought through a separate hole, so as to avoid possibilities of a short circuit, and wherever there are live metal parts care should be taken to insulate them as it is very easy to get a short circuit where all parts are exposed to steam

The leads from the socket should be connected to a screw plug by a suitable length of flexible lamp cord.

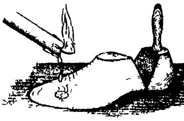
Screw an ordinary 32-candle-power lamp into the water-proof socket. Cover the joint with tape and shellac to keep the steam away from it.

The coffee pot is now complete, and all that is required is to fill the pot with water and coffee, put the cover on with the lamp projecting down into the pot, and screw the plug into the handiest lamp socket.

AN IMPROVISED SHOE STRETCHER

BY JOHN L. [illegible]

Nearly every person at some time or other has wished he could stretch a shoe which at a particular point pinched the foot or irritated a corn It is not necessary to go to a shoemaker to have the leather stretched It can easily be done at home by means of a shoe tree of suitable form upon which an enlargement is formed at the necessary point The enlargement must adhere firmly to the tree and must be of such a nature that it can be easily molded, and that it will not become detached from the tree when the latter is forced into the shoe A material answering all these requirements is ordinary candle wax Sealing wax might be used but the candle wax is preferable as it will not injure the tree, and as it is easier to manipulate The enlargement is formed by dripping a suitable quantity of the melted wax upon the tree at the desired point, and molding the resulting excrescence into proper shape while the wax is plastic. It adheres to the tree with remarkable and unexpected tenacity and owing to its waxy nature tends to slip easily into the shoe with the tree The shoe can be slightly moistened at the troublesome part to facilitate the stretching action



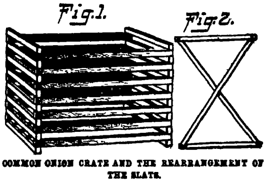
AN IMPROVISED SHOE STRETCHER.

TABOURET MADE FROM AN ONION CRATE

BY WILLIAM P. [illegible]

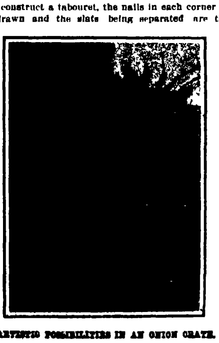
The accompanying illustrations show how a simple crate used in shipping potatoes or onions, can be readily converted into a tabouret or flower stand

A crate such as shown in Fig 1 can be secured from any grocer or from a vegetable dealer The sides and ends of the crate which are comprised of slats arranged as shown, are fastened at their corners by a long nail passing through holes in the ends of the slats.



COMMON ONION CRATE AND THE REARRANGEMENT OF THE SLATS.

To construct a tabouret, the nails in each corner are withdrawn and the slats being separated are then



ARTISTIC POSSIBILITIES IN AN ONION CRATE.

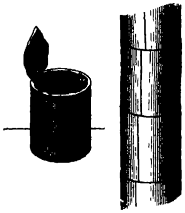
taken and slipped on the nails, and arranged as shown in Fig 2, the long slats forming a cross and the short slats arranged horizontally After the slats have been assembled, the point of the nail can be riveted holding the slats together, and producing an article of rigid construction as shown in the photograph.

The same can be stained or painted at a small cost. While the slats are fairly well planed, the appearance of the article can be improved by planing the slats a trifle more before assembling them

A TIN CAN LEADER

BY WILLIAM C. MCKENZIE

A friend of mine who hates to see anything go to waste has found an excellent use for old tin cans. The rain pipes or leaders of his house are all home made, and built up of tomato cans. He claims that they are much more satisfactory than the ordinary galvanized iron leader for the reason that they were thickly coated with paint on the inside as they were built up can by can The first step in the operation was to remove the top and bottom of each can The solder was melted off by placing the cans on a hot stove After the tops and bottoms dropped off one end of each can was expanded slightly so as to receive the end of the next can which was fitted in, to a depth of about a quarter of an inch Then they were soldered together and as an extra precaution the longitudinal seam of each was re-soldered so as to close any leak that may have been sprung during the process of removing the top and bottom of the can To increase the strength of the leader the cans were so arranged that the longitudinal seams of the successive sections were staggered as shown in the illustration so as to form a symmetrical and regular spiral running around the leader Each can as it was soldered to the leader was painted on the inside wall with a thick coat of paint special attention being given to the joints After the leader was completed the outside also was protected with several coats of paint

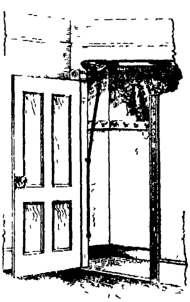


A LEADER MADE OF OLD TIN CANS.

CONVENIENT HANGER FOR THE CLOTHES CLOSET.

BY MRS. T. G. HORTER.

The accompanying illustration shows a hanger, for shirtwaists and other garments, located in the upper part of a clothes closet to utilize space that is usually wasted The hanger is so placed that garments hung thereon will not interfere with clothing that is hung on the usual hooks. But it may be lowered wherever desired so as to provide access to the garments thereon

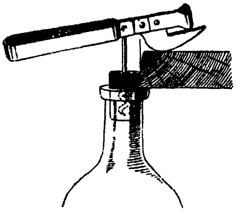


CONVENIENT HANGER FOR THE CLOTHES CLOSET

The boards are fastened to the ceiling of the closet and are provided with pulleys one of which is a double pulley to receive its own cord and the cord running over the other pulley as well. The cords are secured at one end by means of screw eyes to the top of a board hanger which is provided on the under side with a row of hooks properly spaced to support the shirtwaists or other garments, one alongside the other, without crumpling them. The cords are fastened together at the opposite end and are provided with two loops for engagement with a hook fastened to the side of the door casing. One loop when caught on the hook holds the hanger in its highest position, as illustrated, while the other is used when the hanger is lowered for the purpose of hanging or removing a garment. The hanger may be raised or lowered at will by operating the cords.

SIMPLE METHOD OF PULLING A CORK.

If you own a corkscrew of the kind illustrated, you can easily remove the tightest cork without fear of soiling your clothes. After turning the screw well into the cork, place the lip of the bottle under the edge of a table or shelf, then with the upper surface of the table as a rest, lift up on the handle of the implement, and the cork will follow smoothly



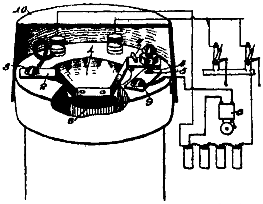
SIMPLE METHOD OF PULLING A CORK

ALARM FOR BATTERIES OF ELECTRIC GAS LIGHTERS.

BY L. G. MANDY

My home is equipped with electric sparking devices for lighting the gas jets. The system as I found it had one serious drawback namely, that in some mysterious way the current would become short circuited and exhaust and ruin the battery Upon investigation, I found that a device could be bought which would give an alarm in time to correct the short circuit before the battery was affected, but that the device was attached to and made a part of a spark coil I proceeded to construct one on the spark coil which formed part of the lighting system It is an extremely simple arrangement and can be made in a few minutes

Cut away the wood of the end of the spark coil as shown at 1 in the illustration so as to get to the ends of the core wires. Bend a piece of thin sheet spring brass ⅝ inch wide into the shape shown at 2 Fasten one end with a screw 3 to the end of the coil Fix a platinum contact point to the under side of the opposite end at 4 Under this contact place the co-working contact 5 The contacts taken from an old bell will be found satisfactory To the under side of the bent portion of the piece 2 secure a small disk of soft iron 6 Care must be taken to bend the piece 2 so as to bring the iron against the core at the same time that the contact is made at the platinum points. Arrange a small stop 7 to prevent the iron rising too far from the core. The movement at the contact points should not be more than 1/16 inch, and the spring of the piece 2 should be very light. Place a small bell or buzzer 8 at any convenient point to give the alarm. This should be connected to the device as shown, one of the posts on the coil is connected by insulated wire to one of the contacts as at 3, the opposite contact 9 is connected to one side of the bell. The return wire is connected to the battery so as to place only a single cell in the alarm circuit. A cap 10 of pasteboard or other material must be used to keep out the dust.

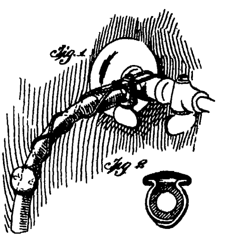


ALARM FOR THE BATTERY OF AN ELECTRIC GAS LIGHTER.

This device has been in use upward of three years, and has saved the battery on several occasions.

GAS-TUBE SUPPORT.

To prevent your gas tube from breaking where it hangs from the fixture, use a piece of spring-brass wire, 18 gage, 18 inches long. Fold this double, and wrap about the fixture as illustrated. Bend the free ends outward, and set into the under side of a large paper-tack head or similar article as in Fig. 2. This arrangement, if neatly executed, will support the tube in a graceful curve It is extremely simple, and will not prevent removal of the tube.



GAS-TUBE SUPPORT

SUBSTITUTE FOR ROD THREADER.

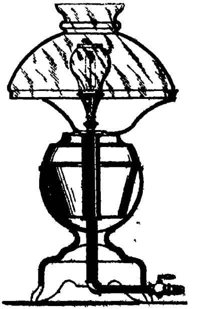
Not long ago the writer hit upon the following idea for a rod threader for quick and accurate work on rods from 1/16 to 3/8 inch in diameter All one needs is a bench or blacksmith's drill, with a three-jawed chuck Clamp the rod to be threaded in the chuck of the drill Place the die in the holder as usual hold the die against the end of the rod to be threaded, and turn the drill at slow speed Those trying this method will find it a much quicker and better way than threading by hand in the usual manner

DROP LIGHT MADE FROM AN OIL LAMP.

BY R. A. JOHNS

Since gas has supplanted kerosene for illuminating purposes many quaint and highly prized oil lamps have been put out of commission These lamps may be changed into attractive drop-lamps in the manner illustrated herewith.

A center-draft lamp is best adapted for the purpose, but any kind will answer The hole on top of the oil reservoir is first soldered up and through the central draft tube a small gas pipe is placed, with a threaded end on top, to receive the burner Any mantled burner may be used Under the burner is placed a washer, resting on top of the oil reservoir, which keeps the burner in place. At the lower end of the gas-pipe an elbow is screwed on. Between elbow and the bottom of the oil reservoir is placed a short piece of pipe, so that, when the elbow is screwed up, the tube will be tight, thereby holding burner secure to the oil reservoir From the elbow, a short piece of gas pipe is screwed in, with the ordinary plug-cock and attachment for the gas hose.



DROP LIGHT MADE FROM AN OIL LAMP.

RECENTLY PATENTED INVENTIONS.

Pertaining to Apparel.

CLAMP FOR GARMENT-SUPPORTERS —J. C. Copeland, New York, N Y The more particular purpose of the inventor is to provide a metallic member for supporting garters and the like and comprising certain parts, some of which are movable relatively to others, and so arranged as to facilitate the clasping and unclasping of the movable portions and for enabling the movable portions to spring automatically into the positions which they occupy when unclasped.

Electrical Devices.

TUBULAR INSULATOR.—L. Steinberger, New York, N Y The invention relates to insulators, the more particular object being to produce a high tension insulating tube suitable for insulating cables, wires, and other conductors energized by high tension currents, the tube providing a very high degree of insulation and at the same time affording great mechanical strength

HIGH POTENTIAL STRAIN INSULATOR —L. Steinberger, New York, N Y The invention relates to strain insulators used in connection with electrical conductors, and more particularly to conductors adapted to convey currents of high potential Among its many purposes, one is to give the various parts of the strain insulator such conformity as will confer upon them a comparatively high degree of mechanical strength coupled with a high dielectric capacity

ELECTRIC ISOLATION SYSTEM —N C McClure, Healdsburg, Cal In this invention the aim is to enable the operator on a circuit where there are a number of instruments being used, to call up or form connection with any one instrument such as a telephone telegraph, etc on the said circuit by ringing a bell or by other signal without disturbing the others and when such call is answered to enable the parties to communicate with each other without being heard by others on the same line

INSULATOR —J T Bond, Palatka Fla The insulator is designed for use in inside and outside work and for outside work where wires pass along buildings and the like and also for pole work Under-cut edges of an annular groove form a species of hook for retaining wires in place in certain pole work This form of groove assists in stringing wires when constructing new lines or renewing old since the wire may be laid in its grooves during the construction and afterward secured in place

METER LOCK - J H Jackson New York N Y An object in this case is to provide a durable lock for use in electric meters and similar devices, by means of which unauthorized opening of the meter and tampering therewith is prevented and which, when the seal is broken, can be easily released and can easily be replaced.

Of Interest to Farmers.

LINT COTTON PICKER AND CLEANER —J L. Hart Chickasha Okla The machine is adapted for picking and cleaning lint cotton either in loose form or as it comes from the bale Cotton placed in a reception box is pushed and fed forward by a head block to the vertical run of an endless toothed traveling belt whereby the cotton is picked subjected to the action of the air, and largely freed from foreign matter

THRESHING CYLINDER TOOTH — T Dagel, Sibley Iowa. The object of the inventor is to produce a tooth which may be easily replaced and removed, and which is firmly braced against the cylinder in the direction of the greatest strain The tooth is not complicated in structure and is easily removed and replaced.

TROUGH VALVE.—D I Mauldin Ozona Texas. This automatic float valve is designed especially for use in water troughs wherein the supply of water is conducted from a reservoir into a trough and consumed in the latter, so that the water will be automatically supplied as the water level lowers in the trough

VALVE.—R H Chale, Sonora, Texas. In operation, as long as the float valve operates properly, the water will be shut off whenever the float is in the required position Should the device fail to operate the trough will soon fill up with water, which passing out through an overflow pipe, enters a cup, and when this is full, a lever will swing into position, thus cutting off the inlet from the outlet, and stopping the flow until the trouble is remedied.

Of General Interest.

OAR-LOCK.—T W Carey, Jr., New Orleans, La. The purpose here is to improve upon the oar-lock for which application for Letters Patent was made by Mr Carey the improvement consisting in the material simplification and lightening of the construction without detracting from its strength, together with an improved means for regulating the rotation of the oar in its bearings, and for regulating the dip of the oar

FILE.—E. Rustin, Atlanta, Ga. By use of this file the wrapping girl or cashier can sort the sales checks as they are received, so that those received from each salesman will at all times be filed by themselves in the order received. In use it is possible for the girl or cashier to file the sales check by one movement of one hand, and there is no danger of the sales checks being blown away by electric fans while being filed or subsequently

FIRE-ESCAPE.—W H Jay La Beau, S. D. In this instance the invention refers to fire escapes, and it has for its object to provide a standard which will permit a person to embrace it and slide to the ground, there being means to enable the person to regulate the rapidity of his descent without burning or chafing his hands or other portions of his body

CABLE-SQUEEZER —H D Robinson New York, N Y The object of the improvement is to provide a device which may be easily and quickly applied to the mass of strands going to make up the cable which will force them together into a perfectly cylindrical mass, and which may be very readily loosened and moved after the permanent securing means has been applied adjacent the point last squeezed into shape

PROCESS FOR THE PRODUCTION OF A LEATHER SUBSTITUTE. — R Werner, Vienna, Austria Hungary In this case the product obtained by the process resembles leather very closely, being flexible extensible and possesses a high degree of strength and the other physical products of leather so that it may be used as a complete substitute for that material

FEED BAG - D L. Toland, Bayonne, N J The bag insures a liberal supply of air to the animal s nostrils and the construction is such that it will prevent the waste of grain which may fall out under the animal's throat Such a waste often occurs on account of the habit of tossing the head in order to bring the grain within reach of the lips

PISTON PACKING —G R Thompson Republic Mich The invention pertains to piston packing for air cylinders and relates more particularly to a packing ring fashioned from hard fiber generally known as indurated or vulcanized fiber and split so that it can be sprung upon the piston the ring tending to spread against the walls of the cylinder owing to its own normal resiliency

DIE FOR PRESSING SHEET METAL C F Steiger, New York N Y The improvement refers to dies such as are used for pressing sheet metal to produce certain ornamental designs or patterns. The die is intended especially to be used for forming the risers of metal staircases. The die can be used so as to form a number of different patterns, differing materially in their general form or artistic effect

GRAPPLE —C L. Simmons Spokane Wash The object of the present invention is to provide a grapple for hoisting concrete blocks and other articles and having adjustable and reversible means to permit the use of the grapple for hoisting small and large blocks, and for grappling a block either outside or inside It relates to grapples such as shown and described in Letters Patent of the U S formerly granted to Mr Simmons

CHURCH-OFFERING ENVELOP —J H Earle Richmond, Va This invention is distinguished by the form of the blank from which the complete envelop is made, by the arrangement of the different sections of the blank so that they are to fold and form opposite pockets which are placed back to back and sealed together and have separate and opposite sealing flaps The general form of the blank is such that it may be cut economically from large sheets and the complete envelop is of less dimension than those originally used

DAYLIGHT DEVELOPING APPARATUS.—J W Mees, 34 Albert road Stroud Green London England The invention consists in providing a container with a detachable spool box which is adapted to receive the exposed spool direct from the camera and from which the film is wound into the container at same time as the apron the spool box being then removed so as to enable the container including both apron and film to be placed in a developing tank.

VENTILATOR.—J Jacobs Akron Ohio. The aim of the inventor is to provide a form of ventilator for roofs, adapted to be opened and closed and at all times protect the opening from rain and snow, and when closed make a very tight connection. It is of the type employed in ventilating shafts or flues of warehouses, factories etc

FIRE ESCAPE —T R Anderson, Oklahoma Okla The purpose of the invention is to provide details of construction for an escape of the inclined slideway type, which afford a safe device that is foldable at the side of a building for protection from the elements, and which may be quickly placed into position for service as occasion may require.

GAGE AND MARKING DEVICE. — A Veitch, Canton, N Y The invention is for employment by woodworkers for marking out lines of mortises or open recesses in casement jambs and door stiles, to receive hinges and it is especially well adapted for the purpose, and it may also be used as depthening and out lining gage for forming recesses in other constructions of wood or metal.

HORSESHOE-CALK.—H W Schorr, Scranton, Pa. In this case the improvement has reference to horseshoe calks, the more particular purpose being to provide a shoe having its calks detachably secured in position so that they may be readily removed from or replaced upon the shoe.

PAINTING APPARATUS.—G A Price, Chehalis, Wash. An object of the invention is to provide a device having manually operable paint brushes adapted to be provided with paint supplying means, flexible pipes for connecting the paint supplying means of the brushes with the portable tanks, and means for placing the paint in the tanks under pressure to effect a forced feed to the brushes.

EYEGLASS-CLIP —W G King, New York N Y The invention relates to eyeglass clips, the more particular purpose being to provide an improved construction offering various advantages of adjustment, strength durability and ease of manufacture The means provided enable the glasses to be adjusted to fit upon the nose without difficulty

SQUARE - T C. Howland Lock Arbor, N J One of the separable arms is provided with a longitudinal slot isolated from the outer edges thereof and provided with a groove at one side extending from the slot through the inner side edge the slot being relatively wider at side of square having the groove than the opposite side the other arm having an end portion to fit into the slot and groove, and screws and similar devices carried by one of the arms and having heads movable into engagement with the other arm and thus locking the two together

TAILOR S MEASURE.— M Cierto, New York N Y The invention consists of a supporting stand an upright arm offset from and vertically adjustable on the stand an approximately horizontal square adjustable transversely on the arm a height gage adjustable on the square having a horizontally adjustable rule or gage vertically adjustable thereon and tapes respectively carried by the post and squares with the tape carried by the square adjustable thereon

WINDOW STRUCTURE R Linkletter Jersey City N J and J H De Freitas New York, N. Y The invention relates to window structures, the more particular object being to provide a number of improvements for use in facilitating the lighting and ventilating of a building or portion thereof in so far as these objects can be accomplished by aid of window structures.

FOOD-WARMER —R. W Mies Troy N Y The aim of this inventor is to provide a warmer more especially designed for use on tables in seaside restaurants and like places, in which open air dining predominates the arrangement being such that the warmer takes up comparatively little space on the table and allows carving and dishing of the food without removal of the dish containing the food from the warmer

HOSE PIPE. W R Calvert, Chickasha Okla Mr Calvert s invention is an improvement in hose pipes and relates particularly to hose pipes comprising sections of metal pipe united by flexible connections The sections may be of uniform diameter throughout or they may be tapered at their ends to facilitate the application of the coils

Hardware.

FARRIER S TOOL.—A I Merrifield East Lebanon Maine In the present patent the invention has reference to certain improvements in farrier's tools and more particularly to a special tool for use in trimming the front portion of a horse s hoof to form a curved recess into which the clip on the horseshoe may extend

OPERATING ATTACHMENT FOR SCREW DRIVERS ETC —P S Peterson Ephraim Utah In this instance the invention pertains to improvements in operating attachments for rotatable tools, such as for instance screw drivers bits, reamers drills or the like but is especially adapted for screw-drivers as it may be employed for turning the driver in either direction.

Heating and Lighting.

HEATER —S Keitonik Johnstown Pa The object of the inventor is to provide an improved heater, arranged to directly radiate a portion of the heat generated by the burning fuel into the room in which the heater is located, to utilize a portion of the heat for heating air to be conducted to other rooms, and to provide an escape for the dust arising from the ash pit

LAMP.—C. M Daniels Paris Ill The invention refers to improvements in incandescent lamps, and more particularly to that type of lamp in which a liquid fuel is vaporized and mixed with air before being delivered to the burner It involves certain improvements in the vaporizing and mixing chambers and means for regulating the same

GRATE FOR STEAM GENERATOR FURNACES —R A Farr, Melville Terrace Bedminster England The special feature in this case is that the grate is composed of rocking bars which turn the fuel over several times during its passage through the furnace The fuel is thus broken up and a light open fire is produced whereby practically perfect combustion is obtained. The stoker thus accomplishes all that can be effected by the best hand stoking by the constant use of the slicing box.

Note.—Copies of any of these patents will be furnished by Munn & Co for ten cents each Please state the name of the patentee, title of the invention, and date of this paper.

Notes and Queries.

Kindly write queries on separate sheets when writing about other matters, such as patents, subscriptions, books etc. This will facilitate answering your questions. Be sure and give full name and address on every sheet.

Full hints to correspondents were printed at the head of this column in the issue of March 13th or will be sent by mail on request.

(12116) H D says Would you kindly tell me whether a sewing machine motor run on the New York city lighting circuit would run on a 110 volt alternating current? Would you also kindly tell me whether the dynamo described in Supplement No 1558 would run as a motor on alternating current if the armature windings were all connected in the same way or rather making the polarity of the armature magnets the same provided it was wound with heavy enough insulation to stand the current? Have any transformers, suitable to be constructed at home been described in the Supplement for changing alternating current at 110 volts pressure to steady current? A A direct-current sewing machine motor is not likely to run on an alternating current although some direct-current motors will run with the alternating current if brought up to speed before the current is thrown on In large portions of New York city the alternating current is used If your motor were used in one of these regions, it is all right for the current you name We do not consider the little alternator of Supplement No 1558 well adapted for use as a motor Much better forms can be bought for a moderate price nowadays We have not published any plans for a rotary converter to change an alternating current to a direct current

(12117) E F W asks Will you kindly give a solution for removing paint from window glass? Also the amount of weight that two pieces of leader pipe galvanized 10 feet in length and 3¼ inches in diameter will support in salt water with ends closed without being more than half submerged A To remove paint stains on glass take 3 parts of potash and 1 of unslaked lime Lay this on with a stick and let it remain some time when the paint may easily be scraped off Two pieces of pipe 10 feet long and 3¼ inches inside diameter will displace 1 1/3 cubic feet of water submerged or 2/3 cubic foot when only half under water 2/3 × 62 4 pounds (weight of a cubic foot of water) 41 6 pounds which is the weight the pipes will sustain when half submerged including their own weight

(12118) D H says In your issue of June 5th is an article headed 'Auroras Some Recent Theories In this article appears the expression a tropical month (27.3 days) I have heard that expression before but do not know just what it means. A The time you name as a tropical month 27 3 days is the time required by the moon to go around the heavens from a star till its return to that star again It is the synodic period of the moon while a lunation is the time from new moon till new moon again which is a little more than 29 5 days The word tropical in this sense refers to the tropic in the sky as the Tropic of Cancer or Capricorn and not to a zone of the earth

(12119) B. P asks I wish to know the difference between iron and steel A Steel is differentiated from iron by the amount of carbon it contains but the distinction is complicated by the fact that whereas any kind of steel contains more carbon than wrought iron cast iron contains more carbon than any kind of steel The qualities of hardening and tempering which formerly distinguished steel from iron now no longer apply since soft steels are produced, which by ordinary blacksmith s tests will not harden All products of the Bessemer crucible and open hearth processes are described as steel Cast steel contains from 0 06 to 1 5 per cent of carbon according to the purpose for which it is to be used the dividing lines between soft mild medium hard and semi-steels not being well defined

(12120) A. L. D asks We have at our plant a concrete and cement reservoir six feet deep ten feet wide thirty feet long but which is not waterproof and when half full of water allows the water to seep through the pores of the cement walls. Will you please advise whether there is a preparation that can be used as paint on the inside of the reservoir which would close up these pores and keep the water from forcing through the walls and at the same time withstand the action of soda ash and lime, which we use in the water Kindly give us what information you have or refer us to the proper authorities. A No ordinary cement concrete is perfectly waterproof and much of it both absorbs water like a sponge and lets it through like a sieve a fact which builders are insufficiently aware of or refuse to recognize many of them claiming to put up waterproof concrete and the market being flooded with waterproofing compounds for mixing dry with the concrete ingredients most of which are of no use whatever Concrete can only be waterproofed by external treatment and then with difficulty and uncertain success.

The best method for your purpose is the Sylvester process into each gallon of hot water required to cover the surface shave ½ pound of castile soap let it dissolve, but do not make suds, and apply to the dry concrete surface boiling hot using a wide soft brush such as a whitewash brush After the soap solution has dried apply lukewarm a solution of ¼ pound powdered alum to each four gallons of water Two repetitions of this process should close all pores and render the concrete waterproof if not, try a further coat or two There is no reason why the above preparation should be affected by soda but if it is unsuccessful you might try a coat of water glass or write to the Concrete Association of America [illegible] Fifth Avenue which has conducted a number of valuable experiments in connection with varied uses of cement and is glad to give information

---

NEW BOOKS, ETC.

A PORTFOLIO OF PORTRAITS OF EMINENT MATHEMATICIANS Edited by David Eugene Smith Chicago The Open Court Publishing Company Portfolio containing 12 plates with descriptive text on tissues Price, $3

The portfolio before us contains some admirable selections and reproductions of portraits of many mathematicians, such as Descartes, Pythagoras, Archimedes Fermat Leonardo of Pisa Euclid, Cardano, Leibnitz Napier, Viète Newton Thales, and the collection would make excellent illustrative material for the classification of mathematical industries. The portrait of Descartes is particularly fine

HOW TO IDENTIFY THE STARS By Willis M Wilhelm Ph D New York The Macmillan Company, 1909 8vo, 38 pp plates Price, 75 cents net

The ability to recognize the important brilliant stars and to locate the more conspicuous constellations is both an interesting and a useful acquirement The number of people who have a real interest in popular astronomy and a fair acquaintance with the stars and constellations is strikingly increasing and they will find a real pleasure in this information The object of this little book is to enable the latter persons to identify the various constellations and stars The method here followed and the material presented is essentially the same as that used in the course of descriptive astronomy in Williams College

LIGHT AND SOUND A Textbook for Colleges and Technical Schools. By William S Franklin and Barry MacNutt New York The Macmillan Company 1909 8vo, 344 pp Price, $1 60

There always seems to be a field for a good book on the very important subjects of light and sound. The literature is already vast on these subjects but the authors have succeeded in presenting some phases in an entirely new light. There is an entire absence of the time honored illustrations which have been copied from book to book The diagrams and illustrations are very numerous and are well executed The book will prove of value to all physicists.

THE RISE AND PROGRESS OF THE BRITISH EXPLOSIVES INDUSTRY Published under the auspices of the Seventh International Congress of Applied Chemistry by its Explosives Section. London Whittaker & Co New York The Macmillan Company, 1909 4to, pp 418 Price, $5 25 net.

This very enlightening book gives an exceedingly interesting history of British explosives reproducing many curious engravings. This is followed by chapters on the concussion caps safety fuses military fireworks and pleasure fireworks. Then comes an excellent bibliography and a chronology from 1242 to 1700 The existing government and private establishments are then described The work is highly technical but will prove of great interest to those whom it concerns

THROUGH THE YUKON OF ALASKA. By T A Rickard San Francisco Mining and Scientific Press, 1909 8vo, 392 pages Price $2 50

This book records observations made in the course of a journey in the Yukon Territory in the District of Alaska during the summer of 1908 The sections devoted to the development of mining methods are particularly valuable and the book should prove of interest to everyone who has ever been to Alaska and the Yukon Territory or is thinking of doing so We are particularly taken with the 175 illustrations which are admirably executed The book is well printed and bound

EXPORTERS ENCYCLOPEDIA FOR 1909 New York Exporters Encyclopedia Company, 1909 12mo pp 655 Price, $5

The present volume contains full and authentic information relative to shipments for every country in the world The Exporters Encyclopedia is now in its fifth year and is a recognized standard authority among export shippers, and has the strongest indorsement of all the transportation lines and export houses, manufacturers, etc engaged in export trade It gives exactly the information which exporters require to enable them to ship their goods with the minimum of expense and trouble It is a valuable compendium for anyone who is at all interested in export trade

Legal Notices

60 YEARS' EXPERIENCE
PATENTS
TRADE MARKS
DESIGNS
COPYRIGHTS &c.

INVENTORS are invited to communicate with Munn & Co., 361 Broadway, New York, or 625 F Street, Washington, D C., in regard to securing valid patent protection for their inventions. Trade-Marks and Copyrights registered. Design Patents and Foreign Patents secured.

A Free Opinion as to the probable patentability of an invention will be readily given to any inventor furnishing us with a model or sketch and a brief description of the device in question. All communications are strictly confidential. Our Hand-Book on Patents will be sent free on request.

Ours is the Oldest agency for securing patents; it was established over sixty years ago.

MUNN & CO, 361 Broadway, New York
Branch Office 625 F St, Washington, D C

INDEX OF INVENTIONS

For which Letters Patent of the United States were Issued for the Week Ending July 20, 1909,

AND EACH BEARING THAT DATE

[See note at end of list about copies of these patents.]

Acid making, nitric, F L Schmidt	928,545
Acid manufacture, concentration and simultaneous purification of sulfuric, G C de Briailles	928,844
Adapter, H S Salt	928,474
Advertising automaton, D F Brown	928,628
Advertising shade for incandescent lamps, J de Yongh	928,879
Agricultural implement, W L Paul	928,690
Air, centrifugal apparatus for separating solid matter from, A Lebraseur	928,673
Air compressor, T O Perry	928,326
Air moistener and deflector, hot, W M Roeder	928,708
Air mover, A Mathis	928,770
Airship, S Lake	928,684
Airship aeroplane, F A Newell	928,687
Alfalfa drier, B B Rowland	928,541
Alkali chlorids, electrolysis of, J Billiter	928,734
Anchor, stockless, W N Bickley	928,695
Animal trap, M M Franks	928,649
Animal trap, G J Miller	928,779
Animal trough, F L Stewart	928,560
Apparel apparatus, W D Forbes	928,437
Armature coils, machine for applying tape to, J S Downs	928,593
Armor plates, treating, S S Wales	928,412
Automatic lubricator, F L Allen	928,417
Automobile fifth wheel, E A Oliver	928,790
Automobile motor, M & W Eastman, reissue	12,993
Automobiles, friction drive mechanism for, A D Cole	928,739
Awning guide rod, R Simms	[illegible]
Axle coupling, car, R Hackbarth	928,445
Axles, method of and means for repairing, A F Hunt	928,519
Baby tender, self-adjusting chronometric, Wilson & Culley	928,415
Bag. See Hand bag.	
Bag frame fastener, J S Isidor	928,661
Ball cleaning device, golf, H Woodward	928,583
Ball players' training device for base, W G Lentz	928,674
Ballistic plate, S S Wales	928,348
Bank, portable, B S Wakeman	928,488
Barbers' chairs, paper actuating device for, D B Brown	928,243
Barrel bodies from pulp, apparatus for making, W H Decker	928,247
Barrel bodies of paper pulp, apparatus for making, W H Decker	928,248
Barrel bodies of paper pulp, apparatus for forming bilged, W H Decker	928,249
Barrel press, J Tomi	928,562
Basket for holding dishes and plates, A Ininger	928,762
Bearing, roller, A Schilling	928,800
Bed, A K Taylor	928,621
Bed, covered, L J Wilson	928,398
Bedstead mounts and the like, machine for buffing, J F Gall	928,254
Beer dispensing apparatus, H S Cornish	928,588
Beets, machine for unearthing, O N Frankman	928,594
Bell and alarm combined, door, H W Dubbs	928,369
Bell fastener, sleigh, W G Frindell	928,576
Belt fastener, G H Smith	928,566
Belt fastener, R M Bennett	928,840
Bench clamp, J W Kincaid	928,400
Binder, loose leaf, L Streit	928,342
Block signaling system, D J McCarthy	928,890
Blower, pressure, E Hassler	928,634
Boat, A E Auel	928,579
Boiler tube cleaner, A M Cockburn	928,361
Book covers, making, C L Baldauf	928,623
Bookbinder, R J Nicholson	928,675
Bookbinding, D E Howell	928,518
Bookcase door guide, sectional, Weis & Hehle	928,566
Bottles or other receptacles, machine for capping or closing charged, E K Moore	928,721
Box, W H Parsons	928,561
Box lids in an open position, means for supporting, Powell & Renwick	928,607
Box top, W H Perkins	928,789
Braids and trimmings, machine for making, J B Kirberg . . . 928,461,	928,469
Brick machine, G M Griswold	928,913
Broom, F Becker	928,490
Broom holder, G E Selsor	928,324
Brush, H M Schwartz	928,550
Brush bridle, adjustable, W Reese	928,659
Brush holder, tooth, R M Ryan	928,542
Brush making machine, H M Schwartz . . . 928,548,	928,549
Brushes, manufacture of, J J Potter	928,411
Buffing mechanism, J F Gall	928,253
Building structure, C C Stutz	928,343
Buildings, construction of, Marshall & Fox	928,314
Burglar alarm, W A Helpbenstine	928,794
Burglar alarm, S R Perry	[illegible]
Burial shirt, C C Holcomb	[illegible]
Cable terminal, F E Cook	[illegible]
Cage, breeder's, T H Knaak	[illegible]
Calculating machine, A J Meier	[illegible]
Camping device, canvas, A G Lakeshill	[illegible]
Can, J G Swain	[illegible]
Can guide runway for, J F Wing	[illegible]
Candlestick lubricator, R F Todd	[illegible]
Candy pail, C A Ley	[illegible]
Candy pail cover, Griffin & Johnson	[illegible]
Canning apparatus, L L Lawrence	[illegible]
Canopy, L F Baumbach	[illegible]
Capsule filler, F W Brown	[illegible]
Car and operating mechanism, dump, Stelzner & Miller	928,386
Car gate, combination side and grain, E Nordstrom	[illegible]
Car, dump, H Price	[illegible]
Car, dumping, C F Antrous	[illegible]
Car fender, Morgenstern & Shepherd	[illegible]
Car fender, street, J Allen	[illegible]
Car retarder, E H Smith	[illegible]
Car, stock, T J McKay	[illegible]
Carbid feeding device, A Davis	[illegible]
Carbureter, F Spagnol	928,770
Carbureter, A Winton	[illegible]

ORVILLE WRIGHT'S RECORD FLIGHTS AT FORT MYER.

(Concluded from page 88.)

Mr. Wright naturally tried to follow and obliged him to make a turn to the right in order to circle around the stake balloon at Alexandria in the right direction. Upon the return trip, after passing over the top of Shuter's Hill—a high hill near the turn—a strong downward current drove the machine toward the earth, and the aviator was obliged to set the horizontal rudder sharply upward in order to regain his proper elevation. After doing this he flew steadily back to the starting point and crossed the line 14 minutes and 42 seconds after first passing over it on the outward journey Deducting the time of the turn at the far end of the course, the time for the 10 miles was 14 minutes and 12 seconds, which corresponds to a speed of 42.35 miles an hour This means that the Wrights will receive a bonus of $5,000 in addition to $25,000 they bid for supplying a 2-man machine. The flight was made with Lieut. Benj. D Foulois as passenger, and, save for the points mentioned above, was uneventful according to Orville Wright. The precision with which he maintained his level while flying over a valley 200 feet or more in depth on the outward trip was remarkable, and had not the downward wind current caught him on the return trip, he would have accomplished this just as well. The undulation and veering out of the course owing to the wind doubtless made a slight diminution in the speed Had there been no wind the brothers might have made faster time and obtained a greater bonus. But, on the other hand, a flight under such conditions as obtained was a far better demonstration of the possibilities of the machine for war purposes, and the Signal Corps may well be proud of its first war aeroplane, which is without doubt the premier machine of the kind in the world to-day

◆

THE FIRST SUCCESSFUL CROSS-CHANNEL FLIGHT.

(Concluded from page 88.)

when the motor slowed down and stopped and he again came down in the Channel. Although his monoplane struck the water rather more gently than on the previous flight, Latham's nose was broken and his head cut open by his broken goggles, so forcibly was he thrown against some of the guy wires of his machine. Nothing daunted, however, he has announced that he will again make the attempt as soon as he recovers. Thus has been opened a new era in aviation—the era in which the flying machine is to be used for traveling from one country to another, be it over land or sea.

The triumphant 25-mile flight of Bleriot across the English Channel, which was accomplished in 37 minutes, or at the rate of about 40 miles an hour, is the culmination of a large number of more or less lengthy, yet successful flights that have been made by this aviator with his "No. XI." machine since it was first brought out last January Some of the more recent of these flights we mention herewith.

During the past two months, M. Bleriot has been experimenting almost daily with either his "No XI." or "XII" monoplane. The former of these he has kept at Issy-les-Molineaux, while the "No XII" machine has been at Douai On June 5th he made two excellent 500-meter flights with the latter at Issy-les-Molineaux, the first alone, the second with his mechanic as passenger On June 11th he made several short flights of from 500 to 600 meters in length, keeping the machine close to the ground; and afterward a magnificent flight of fully a mile, which was terminated by a double S turn at a height of 15 feet. With M. Guyot as passenger, another flight of 1¼ kilometer (nearly 1 mile) at a height of 7 meters (23 feet) was accomplished. The following day M. Bleriot made a straight-line flight of about 250 meters (820 feet) with Santos Dumont and A Fournier as passengers. This was the first time that three people had flown in an aeroplane. The same day several other flights were made with one passenger, the longest of these being about a mile in length at a height of 20 feet. By himself Bleriot afterward flew about 3 miles.

On June 14th Bleriot made some more flights with his 'No XII" monoplane After a short flight of 4 kilometers (2½ miles), he landed to repair his magneto As soon as this was accomplished he made a magnificent flight of 10½ minutes duration, in the course of which he turned his machine in all directions and executed various maneuvers that demonstrated thoroughly its stability Several times he took his hands off the steering wheel The next day, after making a 5-minute flight at a height of 20 feet, he flew with a passenger, but the flight was stopped by the breaking of a connecting rod of the 8-cylinder motor

On June 18th, Bleriot began flying again his "No. XI" monoplane, fitted with a 3-cylinder Anzani air-cooled motor of about 25 horse-power. He made a flight of 4 kilometers (2½ miles) On the 21st he made flights of 3 and 6½ minutes, the motor stopping from lack of oil Just as he was starting on a third flight, the exhaust from the motor set fire to the gasoline in the carbureter, due to the latter being placed too near to the exhaust pipe. The flames were quickly extinguished with sand.

On June 25th he took out his machine about 7 P M., and, notwithstanding a quite heavy wind, he flew for 15½ minutes, making about 12 circuits of the parade ground and showing perfect stability in spite of the violent wind gusts. Each time he passed over the aeroplane shed he took his hands off the steering wheel The flight was terminated because of too much oil which fouled the spark plugs. The flight was officially timed by M. Ernest Zens. At 7 A. M the next day Bleriot made a record flight consisting of 20 circuits of the parade ground in 36 minutes 55 3/5 seconds In the early evening he made three more circuits.

On Monday, June 28th, Bleriot started making flights at Douai with his No XII" machine. He won the first of five prizes of $400 each in a magnificent 1½ mile flight at a height of 65 feet. In a second flight made on this day, he carried a passenger once around the field

On June 30th, he tried to break his previous record at Issy with his 'No XI" machine, but after flying only 650 feet, the engine stopped on account of too much oil. Shortly after he remedied this trouble, and then made four excellent circuits of the parade ground at a speed of over 37 miles an hour The time of the flight was 6 minutes, 11 seconds. There was a gusty wind of from 15 to 20 miles an hour More lubrication trouble was the cause of his alighting

On July 4th Bleriot set up a new record at the Aerodrome at Juvisy This record was made at an aeronautic meet for the benefit of the many people who suffered from the recent earthquake in the south of France. The flight this day was made with the 'No XI" machine. After making one circuit of the course, Bleriot started upon his long flight This flight lasted 50 minutes and 8 seconds. It was brought to a close through trouble with the gasoline feed The flight was made at a height that varied from 50 to 80 feet, and it was the best Bleriot had made up to that time.

On July 9th and 10th, at Douai, he made several flights before 20 000 spectators, but his greatest performance prior to that of July 25th was his cross-country flight of 25 miles on July 13th This flight from Etampes to within 8 miles of Orleans was accomplished early in the morning and was broken by a descent in a field near Barmainville The flight was for the "Prix de Voyage" While it was not necessary to make a descent, Bleriot chose to do this so as to show

(Concluded on page 100)

THE INTERNAL WORK OF THE Wind. By S. P. LANGLEY A painstaking discussion by the leading authority on Aerodynamics, of a subject of value to all interested in airships. SCIENTIFIC AMERICAN SUPPLEMENTS 946 and 947. Price 10 cents each, by mail. Munn & Company, 361 Broadway New York City, and all newsdealers.

BARKER MOTORS
Reliable.—1½ to 10 H. P—Economical
Their perfect operation and reliability are due to common sense mechanical ideas and good construction. While low in price, they are made of best materials with careful attention to details.
C. L. BARKER, NORWALK, CONN.

4 H.P. GARDNER GASOLINE ENGINES
Runs as smooth as electric motor
4 Actual Horse-Power guaranteed. Greater power less vibration, consumes less fuel, most compactly built, practically indestructible. Worth more than other 4 H. P engines costing twice as much. Ideal power for driving lathes, dynamos, fans, water pumps, air compressors, etc. Cheapest power for small shops and factories. Every engine guaranteed. Prompt shipment. Dealers wanted. Get catalog and price list today
GARDNER MOTOR CO., 5147 Delmar Ave., St. Louis, Mo.

Wizard Repeating LIQUID PISTOL
Nickel-plated 5 in. long. Pat'd
Will stop the most vicious dog (or man) without permanent injury. Perfectly safe to carry without danger of leakage. Fires and recharges by pulling the trigger. Loads from any Liquid. No cartridges required. Over six shots in one loading. All dealers, or by mail, 50c. Rubber-covered Holster, 10c. With Pistol, 55c. Money-order or U S. stamps. No coins.
PARKER, STEARNS & CO., 288 Sheffield Avenue, Brooklyn, N. Y

Lubrication Costs Less Than Repairs
Most of the bills for automobile repairs are really the costs of faulty lubrication in disguise. The grade of Vacuum MOBILOIL specially prepared for your particular car will give perfect lubrication and save time trouble and money
VACUUM
MOBILOIL
is made in six different grades. One of these is the right grade for you. The requirements of your car have been exactly determined, and this grade of MOBILOIL prepared for it with scientific precision.
Send for booklet listing every automobile made and the grade of MOBILOIL prepared for it. Thereafter you need only watch the label on the can, the car will take care of itself. The book is free; its facts on the science of lubrication are invaluable. Gives track records to date and other potent motor pointers.
MOBILOIL, in barrels and in cans with patent pouring spout, is sold by dealers everywhere. Manufactured by
VACUUM OIL CO.,
Rochester, N. Y.

VENTRILOQUISM
Learned by any Man or Boy at home. Small cost. Send to-day 2-cent stamp for particulars and proof

30-inch Band Saw

the practicability of his machine Soon after he started up again Bleriot passed Toury and Dambron As he came in sight of Artenay which was the half way point of the cross-country flight last year a rather strong wind from the west caused him to make a semi-circle He flew sufficiently high to clear the telegraph wires and then came to earth on the selected spot at Croix Briquet-Cheville The start was made at 4 44 A M and the landing took place at 5 40 Deducting the 11 minute stop the net time was 45 minutes and the distance 41 2 kilometers (25 [illegible]8 miles) The average speed was therefore 34 1 miles an hour In making this flight Bleriot received a prize of [illegible] 000 francs as pilot and 4 000 francs as constructor The motor manufacturer received 3 000 francs and the designer of the propeller 2 000 francs All these prizes are conditional upon the performance not being beaten before the first of next January The practicability of Bleriot's machine is shown by the fact that 15 minutes after he had alighted the machine had been taken apart and shipped back to his factory at Neuilly near Paris

M Bleriot's two latest aeroplanes have been illustrated and described heretofore in our columns but it would perhaps be well to give the particulars of these machines again at the present time The spread of the No XI is 7 8 meters (25 58 feet) and the length of the body 7 meters (22 96 feet) The lifting surface is 14 square meters (150 69 square feet) The machine is equipped with a 3-cylinder Anzani air cooled motor which weighs 60 kilogrammes (132 27 pounds) complete in running order A 2 1 meter (6 88 foot) diameter Chauviere wood propeller is driven direct from the motor Complete with Bleriot (whose weight is said to be 195 pounds) and with fuel sufficient for a two hour run the No XI machine weighs but 300 kilogrammes (661 38 pounds) It rises in the air at a speed of 5[illegible] kilometers (34 17 miles) per hour when the surfaces are loaded to the extent of 22 kilogrammes per square meter (4 46 pounds per square foot) This is about double the weight carried per square foot of surface by most biplanes It is probable that this machine which is the smallest and lightest that Bleriot has built is able to raise even a greater weight It might perhaps carry an extra passenger although this has not yet been tried The plane is said to be warpable somewhat similar to those of the Wright biplane Consequently there are no wing tips The No XII monoplane on the other hand has rectangular balancing planes attached to the body framework just below the aviator's seat It is somewhat surprising that planes so near the center of the machine will work satisfactorily for this purpose but photographs of the No XII making a turn show that it tips very little Bleriot has two vertical surfaces on each side of the body at the front end and he has also covered the framework about half way back to the rear end and placed a fin keel above it As a result of all this vertical surface the machine does not tend to skid very much in making a turn and consequently it does not have to be tipped inward to counteract the effects of centrifugal force

The No XII monoplane has a spread of 9 meters ([illegible]9 [illegible]2 feet) and a surface of 22 square meters (236 8 square feet) It is equipped with an 8 cylinder V type E N V motor of 0 35 horse power The total weight of the monoplane in running order with water in the radiator but without fuel is 350 kilogrammes (771 61 pounds) With Bleriot Santos Dumont and A Fournier on board and with 16 kilogrammes (3[illegible] 2[illegible] pounds) of fuel the total weight was 560 kilogrammes (1 234 58 pounds) Therefore this machine which weighs only 350 kilogrammes (771 61 pounds) carried a dead weight of 210 kilogrammes (4[illegible]2 97 pounds) The total weight lifted per square foot in this instance was 5 21 pounds—an altogether unprecedented amount. The machine rises at a speed of 55 kilometers (34 17 miles) per hour with 25 kilogrammes per square meter (5 12 pounds per square foot) loading of its single surface. The weight lifted per horse-power varies from 35 to 41 pounds, according to whether the motor is taken as developing 35 or 36 horse-power This monoplane is therefore by far the most efficient aeroplane flying machine that has ever been constructed

After his record flight M Bleriot was presented with a gold medal by the Aero Club of Great Britain and also by the Aero Club of France A few days before, he and Gabriel Voisin had been awarded the Osiris prize, which is given every three years to the men who make the greatest advance in science He was also decorated with the ribbon of the French Legion of Honor as were the Wright brothers In addition to winning the prize of the London Daily Mail ($5 000) Bleriot also won a prize of $3 500 offered by a French wine firm two years or more ago The Alaska Yukon Exposition has put up a prize of $25 000 for a race between Bleriot and the Wright brothers

◆

ELECTRIC LAMPS IN THE MAKING

(Concluded from page 89)

the bulb are then joined together The operation is known as tubulating and the tube thus made temporarily a part of the bulb furnishes the means for the removal of the air inside at almost the final stage in the manufacture of the lamp

With the filament now made and the bulb washed cleaned dried and tubulated the filament-bearing stem and the bulb proper are assembled at one machine The operation of sealing these two parts can best be likened to inserting a stopper in a bottle the bulb being the bottle and the stem the stopper A girl inserts this stem into the neck of the bulb and both parts are revolved on the sealing machine into jets of flame where they melt together Knowing the exact amount of glass that must be melted away and the shape the molten glass will assume when it cools the operative is able to unite the stem and bulb skillfully

Then the bulb goes into another tray along with other bulbs and is taken to a girl in the vacuum room This girl is seated before an earthen pot in which there is a bubbling liquid—phosphorus in a liquid state—which is kept stirred by a jet of water She takes the bulb and with a brush hardly larger than a knitting needle coats the air-extraction tube with a phosphorus solution

After this the bulb is ready for the exhaustion of the air and final sealing Already the air has been drawn from the bulb several times in the processes of manufacture but each time the bulb has been left unsealed It is now ready for the final air test The tube at the big end of the bulb, through which the air is withdrawn by a most ingenious pump is to be sealed by melting

When the bulb is placed in position for exhausting the air the wires running through the neck are connected with an electric current which causes the filament to glow If it were allowed to glow more than a few seconds with oxygen present in the air the filament would burn up and collapse So, while the tube is connected with the vacuum pump, the operative touches it with a blue flame spray which melts bulb and stem apart, and the melted end next to the bulb draws up and closes automatically, leaving the little point seen in the finished bulb over your desk or table Before the sealing is completed the light within the bulb has a bluish cast, and this reveals the fact that all the oxygen has not yet been withdrawn from the bulb. It is then that the coating of phosphorus in the air extraction tube plays its part. The heat upon the tube converts the phosphorus into a phosphorescent gas, and this gas, entering the bulb, neutralizes the oxygen in the bulb Almost instantly the color of the bulb changes from blue to white In this manner the operative

(Concluded on page [illegible])

The Yellowstone and Other Western Trips

A VERY attractive variety of low-fare tours through the West and Northwest may be made this year, including tours through Yellowstone Park, a trip to the Alaska-Yukon-Pacific Exposition at Seattle, through Colorado and California. You will add greatly to the comfort of your journey by *insisting* that your railroad and sleeping car tickets read via the

Chicago
Milwaukee & St. Paul
Railway

A few of the numerous Western trips offered, together with railroad fare from Chicago, are shown below

Yellowstone Park Tours
$44 round trip from Chicago to Yellowstone Park, daily until September 22d Return limit, October 31st. Choice of routes Fourteen different tours at various rates are offered through the park. Stop-overs

Round Trip to Colorado
$30 round trip from Chicago to Denver, Colorado Springs or Pueblo, daily until September 30th Return limit, October 31st. Choice of routes. Stop-overs

Alaska-Yukon-Pacific Exposition
$62 round trip from Chicago to Seattle daily until September 10th Return limit, October 31st Choice of routes Stop overs
$62 round trip from Chicago to Tacoma Spokane, Portland, Victoria, Vancouver, Butte and other points Same dates of sale, etc

To CALIFORNIA
$62.50 from Chicago to San Francisco, Los Angeles and San Diego, June 24th to July 10th and July 27th to August 6th
$72.50 round trip, daily until September 30th Return limit, October 31st Choice of routes Stop overs

$62 for a combination trip through the West, as follows: Chicago to Seattle, via St Paul and Minneapolis, for the Exposition; stop over at Yellowstone Park; returning via Portland and through Colorado to Chicago via Omaha or Kansas City You may reverse these routes, if desired Cost of railroad ticket for this trip, $62, for the round trip

knows that the effect of the oxygen has been overcome.

The bulb is next taken into the photometer room for the purpose of making final tests. It is a large dark room divided into several small stalls. In each stall is an induction coil, from which the bulb is held about two feet away. The induced current from the coil passes through the body of the operator to the bulb, and causes the filament to glow faintly. If the glow is bluish gray, it shows that there is still a leak somewhere, although it may be so infinitesimal that it can scarcely be measured by mils. If the glow is of a purplish hue, it shows that there is air still within the bulb and that the bulb must be further exhausted. This means an operation involving many more handlings.

The next process is the measurement of the bulbs for voltage, a work of the greatest possible delicacy. Two girls, working together, do the measuring. One places the bulb in connection with a current that lights it, and the light from it shines through a small aperture upon a white paper screen. In the center of this screen is a faint star-shaped spot. It requires a certain voltage in the light to bring out this spot.

When bulbs pass the tests and measurements successfully, they are then ready for the appliances with which they are attached to the current-carrying fixtures in general use. They are taken to another part of the factory, where a girl places them in a tray. Threaded brass collars are placed about the necks, and the space between the collars and the necks is filled with plaster cement. The tray revolves through a heating oven that bakes the cement into a hard and holding mass. The ends of the wires running through the necks are cut off, small round brass plates are placed on the ends, the wires are soldered fast, and the lamp is completed.

Once more there is a sort of farewell test for leakages that may have escaped notice or may have developed from the last handlings. This final test is very quick and simple. The sealed ends of the bulbs are held against two electric poles. If the lights are white and perfect, the lamps are considered ready for the last cleansing of the glass, classification, and shipment. Throughout the entire process of development of the bulb into a perfect lamp there are scarcely ever any broken. This is really remarkable when it is remembered that the bulb is not only picked up many times and placed in machines, but is heated and cooled many times.

◆

THE FIGUREHEAD AND ITS STORY

(*Concluded from page 92*)

other meaning of the word dragon denotes watchfulness, so that it is not surprising to find that the *drakkars*, or dragon ships of the Vikings, generally belonged to their chieftains and were the largest ships in their fleets. The next largest were generally *snekkers* or "long serpents" with snake figureheads. In both cases the hull of the vessel played the part of the monster's body, the stern often terminating in a representation of its tail. But although the dragon and serpent were the favorite devices they were not the only ones that did duty at this period as figureheads. When Sweyne, King of Denmark, made a descent on the Norfolk coast in 1004, his own ship "The Great Dragon" was made in the form of the animal whose name it bore; but the bows of the other vessels of his squadron were adorned with the figures of lions, bulls, dolphins, and men, all made of gilded copper.

After the Norman conquest the figurehead disappears from view for some centuries, and it is not until the reign of Henry V that we again find references to its use. Images of the saint after whom a ship was named used, it appears, to be sent on board in the time of Edward III, but there is no record of their having been utilized as figureheads. The reason of their temporary disappearance was the gradual changes in the status of navies and in the build of the ships of which they were composed. The fast oar-propelled long-ship, built only for speed and for war, gradually gave place to the round-ship relying on her sails and built primarily for commerce and the conveyance of mail-clad nobles and their men at arms to the country where they intended to carry on a campaign. Fierce sea fights certainly took place from time to time, but for this purpose any ships that could be assembled together were utilized and prepared for action by the addition of stern and fore castles, built up stages or platforms which overhung the actual stem and stern of the ships and left no place for a figurehead. In process of time the square bow platform or forecastle became triangular and its foremost extremity once more offered a suitable position for the figurehead. Gradually, too, the king became possessed of a certain number of ships of his own, the nucleus of a royal navy. These vessels, though occasionally hired out as merchant ships, were more or less elaborately decorated, and among other decorations the figurehead reappeared. Thus in the year 1400 the Good Pace of the Tower had a large golden eagle with a crown in his mouth as figurehead, and in representations of ships during the fifteenth century little, insignificant figureheads are here and there to be met with. The famous 'Henri Grâce à Dieu' built in 1514, had a squatting lion as figurehead, while the big French man-of-war 'Grande-Françoise' built at St Nicholas de Leure in 1527 was decorated forward with a salamander above which was placed a statue of St Francis. The Elizabethan men-of-war seem generally to have been ornamented with figureheads, but with some exceptions they were neither very large nor very noticeable. At this time a long almost straight projection ran abruptly out from the bow of the ship a little way below the bowsprit. It was very different from the gracefully curved stem which in the seventeenth and eighteenth centuries replaced it and would not, in all probability, support any very great weight at its extremity. Still it often carried a figurehead of sorts. Thus the "Ark Royal' Effingham's flagship in the Armada fight, had a mild looking bird as figurehead. The Bonaventure and others had dragons on their beakheads, others had lion figureheads, one at any rate being gilded. The Mary Rose' had a unicorn, the Swiftsure a tiger, while the White Bear was adorned with an image of Jupiter sitting upon an eagle with the Cloudes. In Holland the Finis Belli, the earliest ironclad, bore the figure of a man in armor at her bow. About the time of James I equestrian figures were introduced as figureheads, and in succeeding reigns these were surrounded with other figures forming a most elaborate bow decoration. Thus the famous Sovereign of the Seas, launched in 16 7, had on her beakhead the figure of King Edgar on horseback trampling upon seven kings. The figurehead of the Commonwealth ship 'Naseby' was equally exuberant, consisting as it did of the Protector on horseback 'trampling upon six nations.' It was evidently a colorable imitation of that borne by the Sovereign of the Seas. Curiously enough this was the ship in which Charles II returned to England at the Restoration. In honor of this she was renamed the Royal Charles." She was fitted with a new figurehead, which is now in the museum at Amsterdam, the ship having been captured by the Dutch when they came up the Medway. Furtenbach in his "Architectura Navalis' published a few years earlier gives an engraving of a very peculiar figurehead which terminated the beakhead of a Turkish pirate brigantine of a class known as *caramussels*. It is probably intended to represent a drag

Pennsylvania Railroad
BULLETIN
908 Miles in 1080 Minutes

The "Pennsylvania Special" is the climax of development in railroad transportation. It is operated primarily in behalf of the busy man.

Under the train is the finest roadbed. Above the rails is the most completely equipped train. On the train is a picked crew. Alongside the tracks is the best Signal System. This combination makes for speed, regularity, safety, and utter comfort.

The "Pennsylvania Special" has made good for many years. It is an asset to the business man. He can recreate on it or work as humor or necessity dictates, but he is using the minimum of time in meeting his engagements.

Three quarters of the circumference of the clock-dial, all in the off hours, is its daily deed.

The "Pennsylvania Special," the pioneer 18-hour train between New York and Chicago, leaves New York every day at 3 55 P. M. and arrives in Chicago 8 55 A. M. Returning it leaves Chicago 2 45 P. M. and arrives in New York 9·45 A. M.

The Gun That Shoots.
FOR MEN AND BOYS
Sends a shot entirely through one-half inch pine and more. Uses compressed air—no spring—same as used by powerful rock drills, air brakes, etc. Many times more powerful than any other Air Rifle. Force of shot under control. Accurate. One user shot 50 sparrows in one day. [illegible] fired by this gun at iron target at 50 feet. Another shoots pennies tossed into the air. Others shoot rabbits and squirrels. Practical gun for all small game. Discharge does not scare game. Can be used where cartridge guns cannot, indoors or out. Ammunition costs 10c or 15c for 1,000 shots. Sold by dealers and jobbers. If your dealer does not sell it, write us. There is no substitute or "just as good." Sent prepaid in U. S. and parcels post countries upon receipt of [illegible]. Descriptive circulars upon request.
[illegible] St. Louis, Mo.

Little Giant
Marine and Stat'y 3 to 16 H. P.
Highest standard of 4-cycle construction. Embodying strength, durability, power, light weight, simplicity. Correct mechanically. Compact, neat, trim. Accessible, easy to start, economical.
Our patent Force-feed Lubricating System effectively lubricates every working part—is indispensable to a 4-cycle motor. Free catalog shows 1 and 2 cyl. engines up to 16 H. P.
UNITED MFG. CO., 173 West Woodbridge, Detroit

Throw the Old Battery Away
No use trying to get good ignition current out of an old, battered, corroded, worn out battery. Get a new one—one that will last this season and many a season to come. The Hubler-Dayton Storage Battery is unbreakable and is proof against rust, corrosion, or deterioration from jolting, jarring or rough treatment. We make the famous Apple Ignition Dynamo and other ignition specialties. You need our catalog; write for it today.

Classified Advertisements

Advertising in this column is 75 cents a line. No less than four nor more than ten lines accepted. Count seven words to the line. All orders must be accompanied by a remittance. Further information sent on request.

READ THIS COLUMN CAREFULLY.—You will find inquiries for certain classes of articles numbered in consecutive order. If you manufacture these goods write us at once and we will send you the name and address of the party desiring the information. There is no charge for this service. In every case it is necessary to give the number of the inquiry. Where manufacturers do not respond promptly the inquiry may be repeated.

MUNN & CO

BUSINESS OPPORTUNITIES

WANTED by established manufacturers of metal specialties patents of metal specialties which could be sold to the carriage or hardware trade. Answer, giving full description. Cately & Ettling, Cortland, N. Y.

Inquiry No. 8966. Wanted to buy nickeloid for buttons.

COMMERCIAL COMPANY in Chicago will consider the manufacture of [illegible] glue less pastes sizings or other profitable specialties. Bank references furnished. Address Chicago, Box 773, New York.

Inquiry No. 8918. For manufacturers of "Wyatt's Electro-Catalytic Sparking Plug."

WILL GIVE AN INTEREST in a vending machine of interstate value to parties who will pay the patent filing fees in foreign countries. For particulars address P. C. Petersen, Box 173, Perth Amboy, N. J.

Inquiry No. 8933.—Wanted the address of Worthington Boiler Co.

PATENTS FOR SALE

FOR SALE. Patent No. 898,732. Safety brake for elevators. For further information address C. F. Bath, Abilene, Kansas.

Inquiry No. 8931. For the manufacturers of gilt paper.

FOR SALE. Patent No. 899,251. Self threading sewing machine needle. Threaded instantly by any one. No openings to catch material. Outright or on royalty. A. G. Bradley, 504 E. Park St., Edwardsville, Ill.

Inquiry No. 8931. For parties who manufacture the Western Stump Borer for boring stumps.

FOR SALE. Patent No. 922,274. Latest and best glass front post card rack. Saves its price in preventing cards from being soiled and stolen. Address Alva Post Card Co., Alva, Oklahoma.

Inquiry No. 8941. For manufacturers of machinery for making fly screens.

FOR SALE

FOR SALE—specialty for manufacturers. Dental floss holder patented May 1909. For further particulars apply direct to inventor T. A. Tubbs, Seattle, Wash., care H. S. Emerson Company.

Inquiry No. 8960. For the address of the Windsor Mfg. Co., manufacturers of waterproof collars and cuffs.

HELP WANTED

LOCAL REPRESENTATIVE WANTED. Splendid income assured right man to act as our representative after learning our business thoroughly by mail. Former experience unnecessary. All we require is honesty, ability, ambition and willingness to learn a lucrative business. No soliciting or traveling. This is an exceptional opportunity for a man in your section to get into a big paying business without capital and become independent for life. Write at once for full particulars. Address E. R. Marden, Pres. The National Co-operative Real Estate Company, Suite 378, Marden Building, Washington, D. C.

Inquiry No. 8968. Wanted the address of the Cohendet Motor Co.

YOUNG MAN graduate of some school in mechanical engineering for position in woodworking plant in small Tennessee town. Good opportunity for advancement. State experience if any and salary. Answer "Position," Box 773, New York.

Inquiry No. 8969. Wanted machines that make accordion dress plaiting (steam).

WANTED. Good man who thoroughly understands making surveying instruments. For full particulars and further information address Wissler, 611 N. Broadway, St. Louis, Mo.

Inquiry No. 8974. For address of firms interested in fishing reels.

WANTED.—First class machinist who can invest $5,000 in an old established business in Denver, Col. Good salary to right man. Address 1521 Water Street, Denver, Colo.

Inquiry No. 8977. For manufacturers of machinery for manufacturing denatured alcohol.

SALESMEN WANTED

SALESMAN WANTED to handle an exceptionally attractive real estate and timber proposition which can be sold on annual, semi-annual or monthly installments. We furnish inquiries and strong literature. Capable, aggressive, energetic man can make desirable connection with largest and strongest house in its line in the country. Sacramento Valley Imp. Co., St. Louis, Mo.

Inquiry No. 8978. Wanted the address of manufacturers of dry pans or crushers to grind sand for plastering and cement works.

MISCELLANEOUS

TOBACCO HABIT CURED OR NO COST. Harmless home treatment. N. K. Works, Wichita, Kansas.

Inquiry No. 8980. For the address of manufacturers of mortars and pestles that are used by druggists.

LISTS OF MANUFACTURERS

COMPLETE LISTS of manufacturers in all lines supplied at short notice at moderate rates. Small and special lists compiled to order at various prices. Estimates should be obtained in advance. Address Munn & Co., List Department, Box 773, New York.

Inquiry No. 8984. Wanted the address of the manufacturers of Cypress wash tubs.

A LIST OF 1,500 mining and consulting engineers on cards. A very valuable list for circularizing, etc. Price $15.00. Address Munn & Co., List Department, Box 773, New York.

Inquiry No. 8987. Wanted the manufacturers of the Van Winkle Woods & Sons and the Weber power motors.

Inquiry No. 8990. For information regarding shoes not made of leather but similar to the same and are as durable.

Inquiry No. 8996. Wanted addresses of manufacturers of machinery for working or turning wood manicure sticks.

Inquiry No. 8997. Wanted the address of the manufacturers of bread or cake boxes.

Inquiry No. 8999. For manufacturers of combined clothes and clothes pin receptacle.

Inquiry No. 9001.—For the address of progressive manufacturers of fruit jars.

Inquiry No. 9003.—For the address of parties who make "Invar" or other metals having a low coefficient of expansion.

Inquiry No. 9004.—Wanted to buy machinery suitable for grinding, sifting and preparing cocoa kernels; also packing same in cartons.

Inquiry No. 9005.—For the address of manufacturers of tin cylindrical paper boxes.

Inquiry No. 9006.—Wanted to buy a machine that will sew or clamp a thin two-ply wood cover on to the top of a bushel basket, wiring and sealing it quickly by power machinery.

Inquiry No. 9007.—Wanted a tin cigar for cigar tags ... that has a wire spring at top and bottom of cigars and operated by pressing the wire springs.

Inquiry No. 9008.—For manufacturers making a specialty of match boxes.

Dept. [illegible], Kalamazoo, Mich.

Concrete Reinforced Concrete —AND— Concrete Building Blocks

Scientific American Supplement 1543 contains an article on Concrete by Bryson Cunningham. The article clearly describes the proper composition and mixture of concrete and gives results of elaborate tests.

Scientific American Supplement 1538 gives the proportion of gravel and sand to be used in concrete.

Scientific American Supplements 1567, 1568, 1569, 1570 and 1571 contain an elaborate discussion by Lieut. Henry J. Jones of the various systems of reinforcing concrete, concrete construction, and their applications. These articles constitute a splendid text book on the subject of reinforced concrete. Nothing better has been published.

Scientific American Supplement 997 contains an article by Spencer Newberry in which practical notes on the proper preparation of concrete are given.

Scientific American Supplements 1586 and 1587 present a helpful account of the making of concrete blocks by Spencer Newberry.

Scientific American Supplement 1534 gives a critical review of the engineering value of reinforced concrete.

Scientific American Supplements 1547 and 1548 give a resume in which the various systems of reinforced concrete construction are discussed and illustrated.

Scientific American Supplement 1564 contains an article by Lewis A. Hicks, in which the merits and defects of reinforced concrete are analyzed.

Scientific American Supplement 1551 contains the principles of reinforced concrete with some practical illustrations by Walter Loring Webb.

Scientific American Supplement 1573 contains an article by Louis H. Gibson on the principles of success in concrete block manufacture, illustrated.

Scientific American Supplement 1574 discusses steel for reinforced concrete.

Scientific American Supplements 1575, 1576 and 1577 contain a paper by Philip L. Wormley, Jr., on cement mortar and concrete, their preparation and use for farm purposes. The paper exhaustively discusses the making of mortar and concrete, depositing of concrete, facing concrete, wood forms, concrete sidewalks, details of construction of reinforced concrete posts.

Each number of the Supplement costs 10 cents.

A set of papers containing all the articles above mentioned will be mailed for $1.80.

[illegible] head and [illegible] from its mouth. [illegible] some kind of a [illegible] inside the [illegible] with its muzzle concealed in the monster's mouth.

The French were always noted for the excellence and beauty of their warships, and it is not to be supposed that their ornamentation was a whit behind that of their English contemporaries. As a matter of fact they were, if anything, the more elaborately decorated of the two and often expensively gilded.

The lion about this period became as favorite a figurehead in the French and English navies as was the dragon among the Vikings. Sometimes he was rampant and fierce, at others he assumed a calm and majestic attitude. The lion went out of fashion in the French fleet after a short time, but was retained rather longer in the British service and adopted very extensively by the Dutch navy. The "Vreyheid," Admiral Winter's flagship, had a lion figurehead. Later full length figures, often of a classical nature emblematic of the name of the ship they ornamented, quite ousted the king of beasts, and these lasted right up to the beginning of the ironclad period between 1860 and 1870. There were a few exceptions to the lions and the full-length figures that succeeded them, notably the figurehead carried by the Britannia of 100 guns in the reign of William III, which was an elaborate representation of the royal arms embellished with scrollwork and other devices, and that which adorned the Victory at Trafalgar, which was also the royal arms with the figures of a seaman and a marine as supporters. Some years afterward these were transformed into a pair of cherubs. But the full length—or more often the three-quarter length—figure continued to ornament the bows of all classes of men-of-war right up to the beginning of the ironclad period.

The French were ahead of everyone in launching the first seagoing ironclad—La Gloire. She had no figurehead, but the Warrior and the Black Prince, a pair of sister ships, which England constructed in reply, were ornamented with two of the finest figureheads that have ever been made. But both these ships had overhanging or swan bows, while their successors had the ram bow, which did not lend itself so well to this style of decoration, and a shield or coat of arms surrounded with more or less elaborate scrollwork became the vogue for the bows of an ironclad. There were exceptions, of course, especially in ships of low freeboard. Thus the figurehead of the old Royal Sovereign turret ship (which, by the way, was an old wooden line-of-battle ship cut down) was unique in having a lion standing at the top of the stem above the medallion of Queen Victoria which was below it. The "Rodney" and "Centurion" both had bust figureheads illustrative of their names, while the French battleship "Brennus" was decorated in the same way with a very fine piece of wood carving. At this period there were plenty of small craft among the warships of the world which still preserved the swan bow, and with these the older style of figurehead still preserved its supremacy. H. M. S. Iris, for instance, had a beautifully designed angel, while the unfortunate gunboat "Serpent," wrecked off the Spanish coast, bore a snake. Toward the end of the nineties the figurehead began to disappear altogether from the British and the French man-of-war. The principal reason alleged for the abolition of the figurehead in England was that it got in the way when rigging out the torpedo-net defense, which on its part often damaged the ornamentation, necessitating an expenditure on repairs. Probably the initial cost was also thought to be an extravagance. But the practical, [illegible] economical German navy [illegible]

(Concluded on page [illegible])

figurehead in their new and formidable navy and have evolved some very handsome specimens despite the ram bow. What, for instance, could be more decorative and appropriate than the fine figure of Germania on the bow of the "Deutschland," one of their very latest battleships? The scrollwork on the cruisers 'Bismarck" and 'Eber' is also very artistic. The probability is that the German Admiralty regards esprit-de corps as a very valuable and practical asset and thinks that nothing is ill spent which in any degree serves to stimulate this feeling. Certainly in the old days seamen venerated the figurehead of their floating home in much the same way that a regiment adores its special and distinctive badge. 'So now my lads," said Capt. Hall when in command of a frigate on board of which there was an epidemic of bickering and quarreling among the ship's company, if this be not put an end to and hearty good-will restored, I'll blacken your figurehead and put the ship in mourning. The threat had a most salutary effect, and the handsome bow-ornament shone resplendent to the end of the commission.

In the far East the Japanese and Chinese have one uniform bow decoration for their men-of-war, the former using a conventional representation of the Imperial chrysanthemum and the latter the national dragon with the head of a camel, the horns of a deer, the eyes of a rabbit, the ears of a cow, the neck of a snake, the belly of a frog, the claws of a hawk, and the palms of a tiger.

In the United States the figurehead has followed much the same lines as in Europe. That of the Chesapeake," famous for her duel with the 'Shannon," can be seen in the gardens of Ashford House in Woolmer Forest. That of the "Delaware,' representing the Indian chief Tecumseh, is in the grounds of the naval academy at Annapolis, and is saluted by every cadet when he passes it, lest haply the omission to do so should bring him ill luck in the passing-out examination. Though not on so elaborate a scale as in the German navy, the United States ships, even of the newest types, are still decorated with scroll work at the bow and in some cases a new departure has been made in placing a handsome full-length figure or figures of bronze on the foremost turret between the two bow guns. The Massachusetts," for instance, has a most handsome and decorative figure of a Winged Victory which was presented to her by the State whose name she bears, while the "Kearsarge" and "Alabama"—whose former namesakes fought so desperately with each other off Cherbourg in 1864—have similar decorations symbolizing in the figures the North and South clasping hands, a reunited country.

This seems an excellent idea and one that might well be followed in all navies. A bronze figure on the foremost turret would more than replace the figurehead of former days. It would, unless destroyed in action, be practically everlasting and be passed on from one ship to its successor of the same name. It would be a far better and more appropriate heirloom than the services of plate which it is becoming the custom to present to various ships. Being carried inboard instead of outboard it can be seen and admired day after day by the ship's company, which was not always the case with the figurehead even in its palmiest epochs. May we in conclusion express a hope that the time-honored figurehead may in this form rise "phœnix-like from its ashes" and be once more promoted to a place of honor in the world's war navies?

* * *

A 7 foot flywheel upon a Russel engine went to pieces the other day at the station of the Allegheny Valley Lighting Company, at Creighton, Pa., causing about $2,000 worth of property damage, but no personal injuries.—Power and the Engineer.

Before the Fire or After?

WHEN are you going to find out whether the fire insurance you have paid for is really good or not—before or after the fire which makes it due and payable? You **cannot** change it after the fire. It will be too late **then,** but before the fire you can readily, at no extra cost select an insurance company whose record and strength guarantee the liberal fulfillment of its obligations.

Upon foundations of commercial honor **The Hartford Fire Insurance Company** has built up the largest fire insurance business in the United States. It has paid more than **$125,000,000** to its policy-holders. Its popularity is the reward of merit and the result of nearly a century of honorable dealing with its patrons.

It has published a book, "Fire Prevention and Fire Insurance" which contains valuable information for Householders, Merchants and Manufacturers. It ought to be in the hands of every property owner in America. It may save you thousands of dollars, no matter in what company you are insured. It is free. Send for it.

HARTFORD FIRE INSURANCE CO

Address ______

HAYNES AUTOMOBILE CO., Kokomo, Ind.

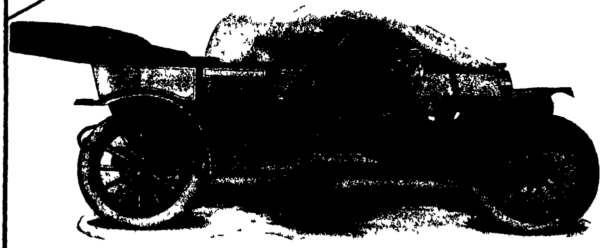
Gentlemen I am thinking of buying an automobile at about $________ Would be pleased to have all the information you can furnish on the subject.

Name____________________

Address________________

DO YOU WANT TO BUY AN AUTOMOBILE?

If so, fill out the blank shown above. We have Some immensely valuable information to send you



$1000.00 Less —— Or, $500.00 More

Here's the latest product from the Haynes factory—our Model 19 for 1910

It is a $3000 00 value car—with all the quality of the highest priced cars—and our price is **$2000.00**—fully equipped

To any man who wants a thoroughly high grade car in every particular—with everything on it worth having on an automobile—a car of reputation—a car of unquestioned merit—we offer this Model 19 Haynes—at a saving of *at least* $1000 00

"Or, $500 00 More" By that we mean $500 00 more than you have to pay for the cheaper class of cars that sell around **$1500.00.**

We are the oldest automobile manufacturers in America and the superior quality of our cars is *unquestioned* everywhere

HAYNES

In offering this $2000 00 car we believe the public will recognize it as the *biggest value* yet offered in motor cars—*which it is*

If just a word of advice to automobile buyers may be permitted, let us say—Be careful and buy the *right* car at the *start*

Too many people have *graduated up* from the cheap car to the car they should have bought in the first place—and by so doing they have lost nearly double the price of the car on the sale of the cheaper cars

We haven t built a car to sell around $1500 00, because *the kind of construction, material and power plant that we are willing to put out under the name of HAYNES, cannot be made and sold at a profit for that sum of money*

Don't think that manufacturers can give you the best of everything in an automobile for around $1500 00 Right material and skilled labor cannot be put into a car to sell at that price

But to pay more than $2000 00 is unnecessary This our Model 19 will prove to anyone who examines it.

It is just the car you ll be delighted to own It has style—snap—beauty of line—elegance of finish—is extremely comfortable and easy riding and is as mechanically perfect as any machine on the market—no matter what the price. It has ample power, and goes faster than most people care to ride

We want to send you particulars about this car We want you to examine it before you buy a car of *any* kind

We will tell you where you can see the Haynes Model 19 and have it demonstrated If you are looking for the right car at the right price, accept our invitation and write for particulars of this wonderful machine

A GIFT to Sportsmen

THE STEEL LINING OF UMC Arrow and Nitro Club

SHOT SHELLS

About 12,000,000 men in the country love to hunt better than they love to eat.

Thousands of carloads of UMC shot shells each year contribute to their pleasure—heap up their enjoyment. Mark the attachment which this army of American Sportsmen must have for those sure-hitting UMC Shells of Quality.

The Steel Lining in UMC Arrow and Nitro Club smokeless powder shells is a valuable gift extended to every one of these sportsmen who want a stronger and better shell. There is no extra charge for the extra protection which this tough band of steel gives.

Shoot UMC shells—the only Steel Lined kind. They give best results in Remington and all other shotguns. They cost no more than the unlined kind.

A Clean Shave

All new blades need stropping before using. Not one in ten comes sharp enough for a clean shave.

Why scrape your face with dull blades, or continue to throw away money for new ones, when the Gaylor Automatic Stropper will resharpen all your dull blades in a few moments, giving them a keen, smooth edge better than new. The action is automatic, no practice required, a child can use it. It is the only stropper in the world that successfully sharpens double-edge blades.

Price $1.50

In case with barbers' genuine horse hide strop, $2 00

Order through your dealer. Or will send postpaid on receipt of price. Be sure to state for what make of blade. Money promptly refunded if not entirely satisfactory. Write for descriptive circular. Agents wanted.

CHESLEY & CO CHICAGO U.S.A.

WANTED—A RIDER AGENT

IN EACH TOWN and district to ride and exhibit a sample [illegible] Model "Ranger" bicycle furnished by us. Our agents everywhere are making money fast. *Write for full particulars and special offer at once*

NO MONEY REQUIRED until you receive and approve of your bicycle. We ship to anyone, anywhere in the U. S. *without a cent deposit* in advance, *prepay freight*, and allow TEN DAYS' FREE TRIAL during which time you may ride the bicycle and put it to any test you wish. If you are then not perfectly satisfied or do not wish to keep the bicycle you may ship it back to us at our expense and *you will not be out one cent.*

FACTORY PRICES We furnish the highest grade bicycles it is possible to make at one small profit above actual factory cost. You save [illegible] middlemen's profits by buying direct of us and have the manufacturer's guarantee behind your bicycle. DO NOT BUY a bicycle or a pair of tires from *anyone* at *any price* until you receive our catalogues and learn our unheard of *factory prices and remarkable special offers* to rider agents.

YOU WILL BE ASTONISHED when you receive our beautiful catalogue and study our superb models at the *wonderfully low prices* we can make you. We sell the highest grade bicycles for less money than any other factory. We are satisfied with [illegible] profit above factory cost. BICYCLE DEALERS, you can sell our bicycles under your own name plate at double our prices. Orders filled the day received.

SECOND HAND BICYCLES. We do not regularly handle second hand bicycles, but usually have a number on hand taken in trade by our Chicago retail stores. These we clear out promptly at prices ranging from [illegible]. Descriptive bargain lists mailed free.

TIRES, COASTER-BRAKES, single wheels, imported roller chains and pedals, parts, repairs and equipment of all kinds at *half the usual retail prices.*

DO NOT WAIT, but write today and we will send you free by return mail our large catalogue, beautifully illustrated and containing a great fund of interesting matter and useful information, also a wonderful proposition on the first sample bicycle going to your town. It only costs a postal to get everything. Write it now.

WANTED—A RELIABLE AEROPLANE MOTOR.

Unless the builders place at the disposal of the aeronaut a motor which can run with absolute reliability as long as there is a pint of fuel left in the tanks, further progress of the aeroplane at least as regards length of flights seems destined to be greatly retarded Not many moons ago a 24 horse-power automobile set out upon the roads of Massachusetts to see how far it could travel without a stop It ran ten thousand miles To-day the aeroplane operator takes his seat grasps his levers and starts his engine with the forlorn hope that it may continue to run until he has covered some modest stretch of time or space Every moment that he spends in the air he is watching anxiously for the first signs of that fatal 'missing' which marks the probable end of his flight Latham, with a machine which is apparently perfect in balance and control sweeps easily through the first half of the distance across the English Channel when suddenly motor trouble begins and he must perforce float in gloriously into the sea. The Wright brothers with an aeroplane which is the perfection of lightness strength and control at the present writing have spent some weeks in Washington wrestling with the obstinacy of their motor

Apart from its motor the aeroplane must be considered to have already reached a high stage of excellence Instances of failure of the planes while in the air are very rare indeed we do not recall a recorded instance for many months past of the failure of a flight through the breaking of the wings or body of the machine The control, in the best machines appears to be perfect

Why is it, one asks that an internal-combustion engine which will drive one machine over a continuous stretch of ten thousand miles of country without stopping, cannot drive another machine through the air without showing all the eccentric obstinacy and the hundred and one ways of breaking down which characterised the motor of the early days of the automobile? The anomaly is certainly difficult to explain and we can only suggest a few of the conditions, which in the aggregate may account for the present unreliability of the gasoline motor in aerial work

In the first place then many if not most of the aeroplane enthusiasts are obsessed by the fetish of light weight and under this obsession they make the mistake of trying to build a light weight motor of their own. The result is a machine which is usually too frail for its work The problem is further complicated by the fact that this motor is mounted upon what at best is an unstable platform Now, as a matter of fact the duty laid upon the aeroplane engine is far heavier than that upon the automobile engine for whereas the latter runs at from 800 to 900 revolutions per minute the aeroplane motor is always being driven at its highest speed which is usually from 1 200 to 1 400 revolutions per minute The automobile engine is mounted on a very rigid steel frame designed to maintain everything in true line whereas the frame of the aeroplane is light and flexible and where gearing is interposed between crank shaft and propeller shaft, there is a liability of the parts being sprung out of line and twisting and wrenching stresses set up Where the engines are run at such high speed particular care should be taken to insure that the parts function properly Magneto ignition, forced lubrication ample cooling surface whether by air or water and generous bearing surfaces in the wearing parts, should characterize every aeroplane motor Reliability rather than excessive weight-saving should be the first consideration.

The time is ripe for some firm in this country, that has had long experience in motor construction, to take up the building of motors specially suited to the aeroplane and the dirigible. These motors should embody the ripe experience and the high-class materials and careful workmanship which characterize the best automobile motor practice at the present time There is no essential condition of the problem to prevent the construction of an engine that will drive an aeroplane in the air continuously until the last drop of gasoline has been drawn from the tank Practical aviation is to-day awaiting the production of a thoroughly reliable motor

A SENSIBLE "CIVIL CALENDAR"

We have received from an advertising firm in San Francisco a copy of a proposed calendar, whose aim is to avoid the acknowledged drawbacks of the Gregorian calendar by substituting one that is better suited to the requirements of our day-by-day life Although the Gregorian calendar dates from the year 1582, long before that many and various improvements had been suggested for conveniently dividing the 365 days of the year into weeks and months Our correspondents ask "Are we not again far enough advanced beyond the times of 1582 to adopt certain other changes?" and they offer a calendar which divides the 52 weeks of the year into 13 months, each having exactly 28 days. The first of January and the first of every one of the twelve succeeding months fall on a Sunday, and the 28th or last day of each month, therefore falls on a Saturday The obvious advantage of this arrangement is that, since each day of the week must be one of four numbers out of the 28 (Sunday for any month of the year being either the 1st 8th 15th or 22nd Tuesday either the 3rd 10th 17th or 24th etc) if one knows the day of the week it is possible to find the day of the month quickly and without reference to a calendar

The additional month necessary under this system is named by its sponsors Vincent , and it is placed in the calendar between June and July

Thirteen months of 28 days each however give a total of only 364 days for the year and, to accommodate the odd day it is proposed that between Saturday, the last day of December and Sunday the first day of January there should be a day to be known as 'Anno Day' It is not recognized as a calendar day and beyond its name, has no other distinction to separate it from the last day of December Any labor done on Anno Day would have to be a matter of special contract or agreement No interest or rental will accrue upon that day and for all such purposes it would be considered a part of Saturday, December 28th Leap Year is provided for by an extra day between Saturday Vincent 14th and Sunday, Vincent 15th This would be known as Mid-anno Day" and it would be treated in all respects similarly to Anno Day

Although there can be no question of the simplicity and convenience of the proposed calendar in respect of any prospect of its immediate and world wide adoption we fear it must be classed with those two other great desirables the 'metric system' and the longer daylight day" We are not more firmly convinced of the advantages of this and those propositions for simplifying and rendering easier and more pleasant the round of daily life and its duties than we are that to bring about these suggested improvements will take many years of arduous and persistent agitation

MEDIEVALISM IN MODERN CHEMISTRY

In the Revue Générale de Chimie Pure et Appliquée, Gustave D Hinrichs publishes an article in which he criticises severely the return of modern chemistry to medieval ideas—in Hinrichs's opinion, medieval error

While one cannot but regret the intensely acrid tone in which the author writes, and the almost directly personal character of some of his remarks, one is forced to admit that there is some justification for his criticism At the same time Hinrichs's article draws attention to some really very interesting parallelisms between the ultra-modern conceptions of chemistry and certain dicta of the ancient alchemists. Thus he quotes from Berthelot's work 'Les Origines de l Alchimie" (1885), the following passages "According to the view of the alchemists, lead was the parent of the other metals From it were produced the three metals copper, tin, and iron."

"From lead also silver was made. This idea must have seemed quite natural to the ancient alchemists, who recovered silver from argentiferous lead by cupellation"

Again, in his work "Archéologie et Histoire des Sciences" (1906), Berthelot quotes from Chinese writings

"There are some who say that *hou* cha absorbs the vapors of green *yang* (orpiment), giving rise to a mineral, called *hong* cha, which in the course of two hundred years becomes converted into native cinnabar After two hundred years more this cinnabar changes into silver, and this after the lapse of another two hundred years [illegible]

Great Britain [illegible] this the statement [illegible] Association for the Advancement of [illegible]

"Helium is the gaseous product of [illegible] tion."

And again

"In the presence of water neon is produced, [illegible] is changed into lithium"

And, more particularly with reference to the [illegible] quoted above from a Chinese author, note the following *résumé* of the modern doctrine, as expounded for example by Arrhenius in his book, "Theorien der Chemie"

The transmutation of radium comprises the following series of steps

I Radium undergoes gradual disintegration. In 1,300 years it is reduced to one-half its original amount, giving rise to

II (*a*) An emanation, which in the course of 4 days produces

(*b*) Radium A, which in turn splits up, in 3 minutes, with formation of

(*c*) Radium B, this again, in 21 minutes forms

(*d*) Radium C in 28 minutes this latter gives

III (*e*) Radium D. The substances radium A, B, C, D are solids, and are transformed in 40 years into

(*f*) Radium E. This in 6 days generates

(*g*) Radium F probably identical with polonium. In 143 days this decomposes into

(*h*) An inactive substance, of which it is unknown whether it is subject to any further transformation.

In the same work the time required for the transmutation of uranium into radium is given as 2,500 million years. This gives for the entire series of transformations 2,500,001,300 years, 153 days and 54 minutes

Hinrichs here criticises the spurious appearance of great exactitude which is given by this statement, to the minute of a period embracing millions of years. In point of fact this criticism is based on a peculiar misunderstanding, for while we may know a period of six minutes say correctly to the minute, the statement of the longer periods obviously cannot be accurate to nearly such a small interval of time, and there is evidently no justification for adding together, as Hinrichs does, the successive periods in order to obtain the aggregate period For the lesser intervals fall far within the range of the error in the estimation of the long period of 2,500 million years, and are simply negligible in comparison with it.

As for Ramsay's statement with regard to the transmutation of copper into lithium, attention is justly drawn to the recent experiments of Madame Curie, which seem to conclusively refute Ramsay's views. For Madame Curie has shown that if the work is carried out with scrupulous care, in platinum vessels (instead of quartz, as used by Ramsay), there is no sign of any "production" of lithium. Hartley also has shown that both quartz and copper, and in fact practically all minerals, contain lithium.

Hinrichs's paper contains many other criticisms, some of which appear, perhaps, hardly justified. We have selected for presentation here only some of the most valuable and interesting suggestions in an article written in a destructive rather than constructive spirit.

KEEPING MILK BY CHILLING IT.

One method of keeping milk consists in sterilization by heating to 230 deg. F., but this process changes the flavor of the milk, renders it indigestible and alters its chemical composition Pasteurization at 176 deg. F and simple boiling at 212 deg. F. are less objectionable, but although the germs of disease are destroyed by these methods other microbes are not destroyed and the milk, consequently, does not keep very long. Freezing is seldom effective because of the difference in the freezing points of the various constituents of the milk, so that when the milk is melted it does not possess its original uniform and homogeneous character Cooling to a temperature slightly above the freezing point has the advantage of leaving undisturbed the homogeneity, flavor, digestibility and nutritive value of the milk, and when the cooled milk is again warmed to the temperature of the air it is found to have undergone no alteration that can be detected by the microscope or chemical or biological tests. Besides, the cooling checks the multiplication of bacteria. The milk should be cooled immediately after it is drawn, or after pasteurization or boiling if these processes are adopted. When the milk is cooled to 35½ deg. F. it may be kept [illegible] days at any temperature lower than 68 deg. F.

The annual prize of $5,000 instituted by [illegible] paid of Belgium in 1874, will, for the [illegible] awarded for the best work in French, [illegible] lish, German, Italian, Spanish or [illegible] progress of aerial navigation, and [illegible] means for its advancement [illegible]

ENGINEERING.

The War Department is greatly pleased with the results of the recent practice with heavy coast-defense guns at Fort Monroe. Five 12-inch and two 10-inch guns were fired at a moving target 30 feet high by 60 feet long, which was towed past the fort at a speed of seven miles an hour. Twenty-four projectiles were fired in 2½ minutes and 18 hits were made. Since a modern battleship is from 400 to 500 feet in length and from 20 to 28 feet in height, it is considered that, had the firing been at a battleship instead of the canvas target, every shot would have found the mark.

The science of aeronautics, in addition to rapid recent developments in practice, is beginning to co-ordinate the results of tests and reduce them to formulæ. A paper by M. D. Drzewiecki in Comptes Rendus gives some rigorous formulæ connecting thrust, carrying power, speed, surface, and incidence. The minimum power per weight carried is obtained when the loss due to friction and the passive resistances is one-third of the resistance due to incidence. The author claims that none of his formulæ are based on unproved hypotheses, but upon direct experiments under varying conditions.

The railroads of the United States have ever been famous for the great size and carrying capacity of their rolling stock. Nowhere in the world are such heavy passenger and freight trains hauled as in this country. Not long ago a train 3,000 feet long, containing 95 cars loaded with 4 451 tons of coal, was hauled from Altoona to Enola, Pa. Trial was made to determine what loads could be moved over the middle division, where the maximum grade has recently been cut down to 0 2 per cent. The train was hauled for 124 miles at an average speed of 17 miles per hour by a single freight locomotive.

The loftiest chimney in the world was recently put into service at the large smelting works at Great Falls, Mont., where it will serve to carry off the gases from the greater part of the large plant. The chimney, which is built of brick, is 506 feet in height above the ground. It is 50 feet in diameter at the top and increases gradually in diameter to the base. The flue includes a dust chamber in which vertically hung wires serve to take out the dust from the smoke. The dust is removed from the wires by shaking mechanism and falls in hoppers in the floor, from which it is loaded into cars in a pit below.

We note in a recent copy of Peru To-Day that the survey is shortly to be undertaken for a railroad, which will exert a most important influence on the commercial development of Peru. The line will start from the port of Paipa, one of the best harbors on the west coast, and will be carried across the lowest divide to be found in the whole of the Andes range in South America, the summit level being only seven thousand feet above the sea. This is less than one-half the elevation of the summit of the two existing trans-Andean railroads in Peru, one of which is 14 436 and the other 14,765 feet above the sea. When the line is built, east-bound freight from the coast of Peru, which must now make the circuit of South America and often go to Liverpool to reach its destination, will be carried directly across the mountains to Iquitos, the head of navigation on the Amazon River.

Railroad engineers are becoming increasingly alive to the importance of building both track and rolling stock with reference to the heavy centrifugal forces which are brought into play when heavy trains are run at express speed around curves. These stresses are particularly severe in the case of heavy electric locomotives built for use on steam railroads. We have always believed that the wreck at Woodlawn near this city was due to a conjunction of low center of gravity of a heavy electrical locomotive, high speed, and insufficient elevation of the outer rail of the curve on which the accident happened. To prevent "nosing" or side oscillation, the New Haven electric locomotives have been provided with end pony trucks, and the New York Central locomotives with four-wheel trucks. In both cases the improvement in the running has been very marked.

As we recently remarked, it has been claimed by good authority that all boiler corrosion is [illegible] to galvanic action. A paper recently read by Mr. G N Huntley before the Society of Chemical Industry on investigation of the cause of [illegible] in a stand-by boiler seems to prove that sulphur is an important factor in some cases, which [illegible] with the electrical theory. An increase in the proportion of caustic soda used had no [illegible], and blisters were found, especially near the [illegible], which, on being pricked, were found to [illegible] with a fine black powder in suspension. [illegible] with a slight excess of [illegible], while the boiler water was slightly [illegible]. It would seem that sulphur in the water is [illegible] which attacks the [illegible]

ELECTRICITY

The city engineer of Toronto, Canada, will shortly call for bids for an electrical pumping plant aggregating 12,000 horse-power.

A long-distance telephone service with four lines is expected to be opened next year between London, Paris, Madrid, Barcelona, and San Sebastian.

According to the Times (London) the Canadian Pacific Railway will grant use of its right-of way for a special wire forming the connecting link between the Atlantic and Pacific cables of the proposed all British round-the-world system.

A French inventor, M. Gabet, has recently made successful experiments in the Seine with a torpedo which he can start, stop, and steer electrically by wireless apparatus on land or in a boat. He expects eventually to control the torpedo for a range of eight miles.

Tests are being made at Brant Rock, Mass., of the apparatus to be installed at the 1 000-foot tower to be erected at Washington. The Navy Department specifications require that it shall be sufficiently strong to send messages 3 000 miles and receive them from the same distance.

Electrification of the Grand Trunk Pacific Railway from the St. Lawrence River to Moncton is being considered. A water-power site capable of generating upward of 100 000 horse-power, greatly in excess of the requirements, has been selected at Grand Falls on the St. Johns River, nearly equidistant from the two points between which electrification is proposed.

Among interesting papers read before the Royal Society in London recently was one by C. Russ upon the electrical reactions of certain bacteria as applied to the detection of tubercle bacilli in urine by means of an electric current. Another by Prof. H. A. Wilson described his experiments to determine the effect of a magnetic field surrounding it upon the electrical conductivity of a flame.

A patent recently granted to Mr. A. F. Rietzel is expected to overcome the difficulty often encountered in electric welding due to the arc jumping at the nearest points of two not quite smooth surfaces and the exact position of the weld not being easily controlled. Raised portions on both sheets to be welded are placed in contact with each other, and the welding temperature reached only at the points desired, with a result similar to riveting, a saving of electrical energy, and elimination of burning of metal resulting.

The Electrical World calls attention to the great superiority of the electric to the gasoline automobile for city use, with especial reference to the anti-noise campaign. The distracting noise of the latter is sufficiently familiar—to an invalid confined to the city for instance—the occasional startling explosion in the muffler of a charge which has missed fire, the screech of changing gears, not to mention the smell. None of these disadvantages apply to the electric vehicle, which also avoids the opprobrium directed against reckless driving, *the electric motor being equally applicable to* a light runabout which a woman or child can operate, or to a heavy commercial truck.

The generation of electricity by aermotors, or "wind turbines," as they call them, is making great progress in England, as shown by an exhibit at the seventieth annual show of the Royal Agricultural Society at Gloucester. The exhibit included a 34 foot turbine on a 60-foot steel tower driving a variable-speed generator with considerable excess storage-battery capacity to provide for calms. Current was supplied for an electric grill, kettles, irons, and fans, as well as a butter churn, a cream separator, a circular saw, and a deep-well pump. By division of the storage battery into two parts it is possible to use 50-volt current for driving the machines and 25-volt current for lighting, the latter permitting the use of metallic-filament lamps.

An interesting article by a lady contributor to the London Electrical Review describes the lighting of an eight-room suburban English home at a cost of $18 75 a year, which is further reduced by saving made in other directions over coal and gas for heating and other purposes. The parlor and dining room have two and one 50-candle-power lights respectively, costing 6 cents each for 16 hours' service, as compared with 7½ cents each for incandescent gas burners of lower power for the same time. The life of curtains, draperies, and plants in the rooms is said to have been twice as long as under the previous gas *régime*, a saving of 12 cents a week for cut flowers alone having been made. Painting and papering had to be renewed only once in four years with electric light, as compared with every two years with gas, a saving of two dollars per room per year. Electric heaters in the living rooms cost 24 cents per 12 hours each at maximum capacity, which can be reduced when the rooms are warm enough, against 28 cents for gas fires or 18 cents for coal fires, comparing favorably even with the latter when the elimination of cost of cleaning [illegible] is considered.

AERONAUTICS.

A new use for balloons is proposed by W. D. Boyce of Chicago, who sailed recently for East Africa in pursuit of natives and big game, which he will hunt not with the rifle but the camera. His idea is to attract wild animals in their native haunts by a light suspended from a balloon, and photograph them in such natural surroundings by flashlight.

Authority has been given by the War Office for the leasing of certain ground near Washington for use as a training ground for officers of the United States army in the use of flying machines. The first officers selected for instruction will be trained by the brothers Wright personally, and they in turn will teach others. A level tract of 163 acres almost free from trees has been chosen, so that the practice of beginners may be made at a height of 20 feet or less from the ground, eliminating as far as possible the danger of serious accident.

On the 6th instant Glenn H. Curtiss, who since his 52½ minute flight at Mineola, L. I., on July 17th is the record holder of the SCIENTIFIC AMERICAN Trophy, sailed for France with a new and untried biplane similar to that which he sold to the Aeronautic Society. Mr. Curtiss will be America's sole representative in the International aeroplane race for the Bennett trophy at Rheims on August 29th, and he will also compete in several of the other contests to be held during the week of August 22nd above the plains of Betheny in the champagne country.

Messrs. Baldwin and McCurdy, the two Canadian engineers who were formerly associated with Dr. Bell, are carrying on experiments at the Petawawa Military Camp, which is about 100 miles from Ottawa, Canada. On August 2nd they tried a new 40 horse-power motor on the "Silver Dart," the last aeroplane of the Aerial Experiment Association. After making several excellent flights of half a mile each with both men on board, the rays of the rising sun dazzled the aviator so that he steered down too soon, struck a knoll, and damaged the machine. This is the first time on record that the "Silver Dart" has carried a passenger. The speed attained is said to have been over 40 miles an hour. The motor has been placed in a new biplane built for the Canadian government and known as "Baddeck No. 1." If the flights with this are successful, it will probably be taken to England and demonstrated for the British War Office. According to the Minister of War, $300 000 will be spent during the next year for aeronautics in the army.

The Aeronautic Society's aeroplane, which was badly smashed on the 18th ultimo when a member, Mr. Alex Williams, was taking his first lesson, has been repaired again and tried by Mr. Curtiss preliminary to his sailing. Mr. C. F. Willard, who had made one short flight before the machine was damaged, is taking advantage of all quiet mornings and evenings to make practice flights. As soon as he has become proficient, he will make exhibition flights in various parts of the country. At the Society's meeting on August 5th Mr. Jose De Viñez gave an interesting talk on model aeroplanes. He exhibited and flew several novel toys which he recently brought over from France. He expressed surprise at the slowness of America in catching the aviation craze. In Paris the children are all building and flying models, from which, as he demonstrated from small paper models made on the spot, much can be learned. It was a toy French flyer, it will be remembered, that first aroused interest in the Wright brothers.

The international aeronautical exhibition at Frankfort-on-the-Main, Germany, was opened a month ago, but nothing startling happened until the arrival of the Zeppelin II airship on July 31st. The 220-mile trip from Friedrichshafen on Lake Constance was made in about 11 hours. The start was made by moonlight at 3 40 A. M., and the first 56 miles to Ulm were covered in 1 hour and 39 minutes, an average speed of 42½ miles an hour. Then a violent head wind sprang up and 5 hours was consumed in covering the next 68 miles. Near Geislingen no headway was made for 25 minutes. The machinery worked perfectly throughout the trip, and the landing was made on a selected spot amid the plaudits of thousands. On July 28th at Friedrichshafen a severe test was made in which the airship rose to a height of 1000 feet in a thunderstorm. On August 2nd a trip to Cologne, 110 miles distant, was attempted. When within 30 miles of that city a severe wind and hail storm was encountered, and the airship retraced its course at a faster rate than such a vessel has ever traveled before. A broken propeller the following day put an end to the second attempt immediately. At 4 40 A. M., August 5th, however, another start was made, and at 10 15 the airship appeared at Cologne and circled the spire of the cathedral. The trip took two hours longer than expected on account of fog. A landing was made in the suburb of Bickendorf. The same day the "Gross II" made a round trip from Berlin to Halle (217 miles) in 15 hours and 40 minutes, an average of 13.85 miles an hour.

SOME ACOUSTIC EXPERIMENTS.

BY PROF. GUSTAVE MICHAUD, COSTA RICA STATE COLLEGE

Tyndall has shown that ordinary fabrics are permeable to sound as long as they are dry, but lose that property when they are soaked with water. The quickest way to make the experiment is to submerge one half of a bed sheet in water and then interpose it between the ear and a watch held close by, as shown in the illustration. The tick-tack is easily heard through the dry part of the sheet, but the wet region intercepts the sound. If both ear and watch are placed on one and the same side of the sheet, the contrary takes place; the wet sheet reflects the sound, which becomes distinctly louder than when the watch is held close to the dry part of the fabric. Advantage may be taken of this fact to repeat without apparatus a classical and pretty experiment usually made with two large concave mirrors.

Two umbrellas are thoroughly moistened and laid horizontally some 15 to 20 feet apart, with the two rods in alinement. This last condition, which is essential, is easily fulfilled by laying the umbrellas as shown, with the point of the rod resting on the back of a chair, while the handle is loosely tied to a vertical stick stuck into the ground. The chair may be moved laterally, the handle may be run vertically along its support, the umbrella rod may thereby be set at any desired angle. A white thread is stretched between the two umbrellas and the rods are set parallel to the thread. This is then cut and removed.

If now two experimenters (one for each umbrella) place either mouth or ear in contact with the rod and at from two to three inches from the sliding sleeve, any word uttered in a low tone in the direction of the umbrella will be distinctly heard in the other umbrella. The voice, however, will not seem to come from the direction of the speaker, but from the opposite side; that is, it will be perceived by the hearer as if the words were uttered in the hollow of his own umbrella by some invisible being. Moreover, a third experimenter placed between the other two, but somewhat outside the straight line uniting the two umbrella rods, will not understand a word of the conversation thus carried on, though he is but half as far from the speaker as the hearer is.

Owing to the large size of the reflectors the experiment is always successful, but if it lasts more than a few minutes care should be taken to sprinkle water over the umbrellas from time to time.

My friend Prof. Tristán, who takes much interest in the teaching of science in common schools, has found another and still easier way of performing the same experiment. A watch is held about two inches above a common soup plate, which reflects the sound waves and decreases their divergence. Another soup plate, kept close to the ear at an angle of 45 deg. with the direction of the sound waves, causes them to converge into the ear. The loud tick-tack does not seem to come from the watch, but from the plate kept close to the ear. It ceases when the two plates are withdrawn.

◆

At the International Congress of Applied Chemistry held in London recently, Mr. Samuel R. Tucker presented a paper dealing with "The Relative Efficiency of the Arc and Resistance Furnace for the Manufacture of Calcium Carbide." Calcium carbide was prepared in two types of furnaces under conditions which would give the best yield. Comparison was made of the product as to its carbide content and its weight obtained per energy unit. The results showed that for the scale on which the experiments were conducted the resistance furnace was much superior to the arc. The best result obtained with the arc furnace was 1,170 watt hours per 100 grammes of pure carbide, while with the resistance furnace the same quantity of pure carbide was obtained with 544 watt hours. The best proportions of lime and coke to be used with the two types of electric furnace employed are also given.

ASKING THE TREE TO SPEAK.

BY CHARLES B. COOKE

Under our system of land surveys the country is being divided into square miles. These divisions are known as sections, and along the lines marking them are established corners at half-mile intervals. The method of marking these section lines varies slightly according to the nature of the country over which the survey is made, but in a majority of cases a rock of the dimensions prescribed by law is placed in the ground at each corner and is known as a corner stone. When these section lines are surveyed through timber it is required also that trees in close proximity to the corner should be marked, giving the township, range and section which that particular corner represents. These are termed bearing trees, and are to aid in the subsequent relocation of the corner stone in the event that it is ever destroyed or removed. Furthermore, it is required that trees along the line of survey should be marked. This is accomplished by chopping off a small portion of the bark on two sides of such trees as are close to the line. This is known as the blazed line, and if well marked can be easily followed even many years after the original work is done. Once on the line, the task of finding the corner stone is simplified, and unless every vestige of it has disappeared, together with the bearing trees relating to it, one is pretty sure to find it. However, in a great many instances these blazed lines are hard to identify, so many years have elapsed since the blazing was done that the bark has completely grown over, or forest fires may have so injured the trees that only here and there one remains to show where the axe has been. Then, again, nearby lines that have been blazed for other purposes are confusing, and oftentimes one follows them up only to find them terminating at some point in which he has no interest.

A SECTION CHOPPED FROM PINE TREE

Showing original blaze and twenty-five years' growth since

The accompanying illustration shows how, in this latter contingency, the line one is looking for may be distinguished from others, provided the year in which the survey was made is known. It represents a section chopped from a pine tree, and shows the original blaze and the growth of the tree since.

During the past year, while hunting for section corners in Colorado which had been established in 1883, great difficulty was encountered in locating the proper lines, owing to the presence of numerous other blazed lines to mining claim corners, prospects, etc. In order to determine whether or not a certain line was the correct one, a section would be chopped out of one of the blazes and the rings appearing in it counted between the blazed scar and the bark. Allowing one year's growth of the tree for each ring found, it was readily determined whether or not the years which had elapsed since the blazing had been done corresponded with the number of years since the survey looked for had been made. In this way it was possible to locate the section lines, and once on them, little trouble was experienced in finding the corners.

The section seen in the illustration was cut from a tree along the line of survey sought, and shows twenty-five rings, which growth identifies the work as having been executed in 1883.

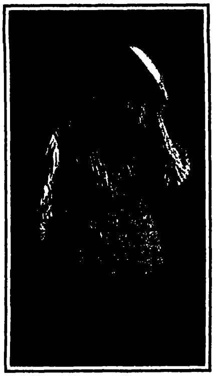
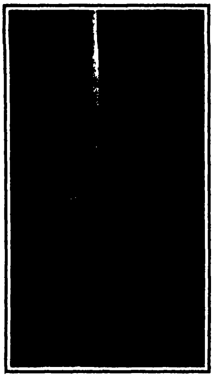
The Visibility of Stars in Daylight.

The blue light of the sky which prevents us from seeing the stars in the day time is strongly polarised. According to the experiments of Cornu the proportion of polarized light may amount to eighty per cent when the air is very clear. The light of the stars, on the other hand, is not polarized. If the polarized light of the sky is cut off by a Nicol prism, it is evident that the apparent brightness of the star will be increased in respect to the brightness of the sky. Hence the star will become more visible, and an ordinarily invisible star may be seen.

This method would be particularly advantageous for the observation of circumpolar stars. These stars are situated at an average angular distance of 90 degrees from the sun, and are, therefore, in the best conditions for observation, as the proportion of polarized light is a maximum at this angular distance. Furthermore, one of the two meridian passages always occurs in daytime, and the observation of both passages is of great astronomical importance. It is singular that this very simple method, which has been suggested by Salet, is not employed in these observations. Salet shows that by this use of the Nicol the power of a telescope may sometimes be made equal to that of an instrument of twice its aperture without a Nicol. Consequently the value of meridian observations, especially in determining latitude, may be greatly increased. Long ago, Arago proposed to use a tourmaline in order to perceive reefs in a calm sea amid the glare of reflected light, by which they are masked. Hagenbach suggested a similar process for eliminating the bluish haze which veils objects near the horizon. Salet, who relates these facts in the Bulletin Astronomique, states that the employment of the Nicol prism in astronomical observations by daylight has not [illegible] [illegible] [illegible] [illegible]



Soup plates as sound reflectors.



The wet cloth intercepts the sound

SOME ACOUSTIC EXPERIMENTS.

MARVELOUS PAINTINGS OF NATURE.

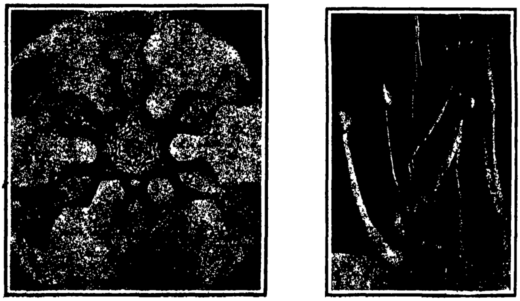
By Dr. Alfred Gradenwitz.

THE novel scope of Nature's artistic work was recently revealed by the marvelous decorative patterns exhibited at the annual show of the French Physical Society The photographs accompanying this article give only a faint idea of their splendor and delicacy of shading. So far from being drawn by the hand of a skilled and imaginative artist, these patterns had been created by Nature in Prof. St. Leduc's physical laboratory at Nantes.

As our readers will doubtless recall from previous articles, Prof Leduc has been engaged for many years in investigating what is called osmotic pressure, or the force of diffusion. This force, with which lay people are relatively unfamiliar, plays an all important part in connection with vital phenomena. It drives the humors of plants and animals through their vessels and pores. According to the views held by the French experimenter, it even determines the forms of vegetable growth In fact, Leduc has succeeded in producing by simple diffusion experiments the most varied artificial plants, of which we illustrate some particularly beautiful recent samples.

The decorative patterns forming the main subject of the present article are indebted for their existence to the same force of nature which manifests itself wherever solutions of different concentration are separated by a porous partition, bringing about a motion of liquid, until a perfect equality of concentration is produced.

The following particulars will enable any amateur to obtain these figures of diffusion On a glass plate are poured out five cubic centimeters of a 10 per cent gelatine solution to which has been added a drop of a saturated solution of different composition (preferably ammonium chloride, bromide, or iodide) On the gelatine thus prepared are arranged symmetrically drops of various solutions, such as calcium nitrate silver nitrate, potassium citrate If this plate be allowed to rest on a horizontal surface the liquid drops are seen to diffuse gradually, generating the most surprising effects of form and color Care should be taken to protect the plate when drying against any shock The resultant picture is glued on pasteboard, like a photographic print, for use as a decorative pattern

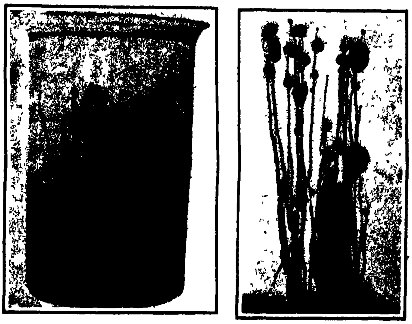


Other forms of plant-like structure obtained by Leduc

Certain substances will produce by their diffusion lines of equal distance, alternately transparent and opaque, the thickness of which lines varies from some tenths to less than 1/1,000 of a millimeter If their thickness is between 1/100 and 1/1 000 millimeter the patterns are full of networks of lines, and rectilinear or circular gratings, giving the most splendidly colored diffraction spectra

These gratings are obtained with a large number of substances. Very beautiful samples are produced by allowing a mixture of saturated solutions of potassium phosphate and carbonate in equal parts to diffuse In fact, the effects thus obtained are quite similar to the scintillation of mother-of pearl.

As Leduc points out, all living tissues show the same network structure. In fact, not only in mother-of pearl but in the wings of beetles, feathers of birds, muscles and sinews of man, and in many other living substances, the same structure and color effects whose production no physical force so far sufficed to explain may be observed



Plant-like forms obtained in Leduc's experiments with osmotic pressure

In addition to its scientific interest the process above described is obviously of the highest practical importance It renders it possible to reproduce the most delicate photographs by coating the gelatine of the photographic plate at 35 deg C with a gelatine layer, containing traces of calcium nitrate on which drops of a mixture of calcium phosphate and carbonate are spread out

In order fully to account for these strange phenomena, the hypothesis should be made that diffusion occurs not continually but periodically at given intervals of time

Dentists have made the startling disclosure that they can alter and enlarge the jaws in any child by simple means, and they have found that the teeth themselves and their arrangement are the pattern from which the jaw takes its shape Three people out of four seem to lack in the proper development of the lower portion of the face by reason of defective and misplaced teeth and weak and ill-developed jaws. Hence we deduce that the 'man of destiny" the man with firm jaw who knows his own mind" is presumably one who was made to chew properly in childhood, and was not allowed to shove down his food half chewed or unchewed by gulps of liquid —Popular Science Monthly

Kieselguhr

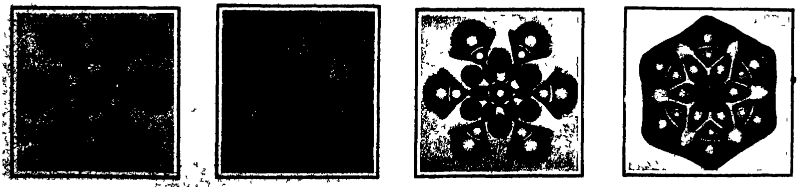
Kieselguhr is a variety of infusorial earth, which is used as a filler for soap sealing wax paints, and other products and employed in the manufacture of dynamite, alizarine soluble glass, cements, artificial stone articles of gutta percha and India rubber, and for many other purposes

Kieselguhr is found in large quantities in Hanover where it occurs in gray brown or pale green layers in alluvial deposits and near beds of lignite It is soft and dry to the touch absorbs water very readily and is not affected by chemical reagents at ordinary temperatures Kieselguhr is found also in Hesse, Hungary Bohemia Tuscany Sweden Finland, and Canada.

The valuable properties of kieselguhr are its low specific gravity (0 25 to 0 55) its great power of absorbing water and its low thermal conductivity, which make it one of the best known heat insulators.

It is extracted from open pits spread on planks on the ground, and left to dry under the action of the sun and the wind Artificial desiccation has not proved practically successful, according to a report of the American consul at Hamburg Drying in ovens presents no difficulty but also no particular advantage and has never been attempted on a large scale (Kieselguhr is quickly calcined by contact with flame.) Various mechanical drying processes have been tried and abandoned in Germany Drying by a blast of hot air has been employed to some extent but only in wet seasons or after partial drying in the usual way The method is too expensive for use except for the best grade of kieselguhr which is employed in making dynamite and when the market price is unusually high

Kieselguhr as it is taken from the pit, contains from 70 to 90 per cent of water which evaporates very slowly Air-dried kieselguhr retains from 15 to 25 per cent of water The dried kieselguhr is ground and packed in bags During transportation and storage it must be carefully protected from dampness.—Cosmos



Symmetrical designs obtained on glass plates by Leduc in experimenting with osmotic pressure.

MARVELOUS PAINTINGS OF NATURE.

HALLEY'S COMET

BY DR. ALEXANDER W. ROBERTS.

Already in the pages of this magazine reference has been made to the approach of Halley's comet the most important astronomical event of the years 1909 and 1910 Every seventy five or seventy-six years this remarkable body completes its far-stretching and extremely elliptical orbit round the sun

When the comet sweeps round the sun at its nearest approach or perihelion, it passes within the earth's orbit while at its farthest reach or aphelion it lies outside the confines of the solar system Thus during the greater part of its long journey for at least seventy three years out of the seventy five or seventy six, it is invisible in even the most powerful telescopes It is then describing that portion of its path which lies outside the orbit of Jupiter When however it is within the orbit of this planet it is near enough to our earth to be visible in our evening or morning skies

At first on its sunward flight it is discernible only as a faint telescopic object but each day witnesses its increase in brightness till at length it is visible to the naked eye is indeed conspicuous enough to compel the gaze of even the indifferent beholder As a rule it is easily seen by the unaided eye for some months

After passing its brightest phase—which it will do this cycle in the first week in June 1910—it rapidly decreases in brightness and is soon lost to view in even the largest telescopes

It was last seen at the Cape Observatory in May 1836, passing after that date into the far distances from which it came But although it vanished from the sight of men its onward track through space was known with as great accuracy relatively as sailors know the way of a ship over the trackless deep And thus every lap of its vast orbit over three thousand million miles distant at its widest reach from our earth has been mapped out with the utmost care and with assurance Unseen for seventy three years, it is yet as surely seen by those who make this branch of astronomy their care as if it shone brightly and continuously in our midnight sky The invisible bonds of law have it in their inexorable hold and from out the confines of that unbreakable leash it can never never pass

In the accompanying figure are given positions of the comet at various dates along the 1835-1910 cycle

We have already said that the comet was last seen in May 1836 It was then moving swiftly away from the sun midway between the orbits of Mars and Jupiter In the early days of 1837 it crossed the orbit of Jupiter Jupiter himself was not very far away when the comet passed under his line of march Slowing now down considerably the year 1838 is well advanced before the region of Saturn's sway is reached In six more years Halley's comet is as far distant as Uranus and in twenty more years it is out beyond the farthest planet And now like a great stately ship wearing in midocean the comet slowly sweeps round in its orbit Its long outward flight is spent and the conquering homeward pull draws it sunward again The year 1872 marked the comet's farthest distance its aphelion after this date its return journey begins

At the opening of this century it was again within the orbit of Uranus By the end of 1907 it had reached Saturn's orbit and early this year it swept within the orbit of Jupiter

On the first of June this year it was five hundred million miles distant from us but rushing in at an ever increasing speed In June its velocity of approach was a million miles a day

It will come nearest to our earth the first week of June 1910 being then only twenty million miles distant from us a hand breadth in astronomical reckoning

After this date it will move swiftly away from the earth becoming daily more faint till in the early days of 1911 it will disappear into the night not to emerge again till the year 1985 when the most of those who read the article will have ceased to care about comets

No small emulation is being witnessed between those observatories endowed with large telescopes as to which one will be the first to pick up the returning voyager from far-distant shores It is expected that this will be done in August or September of this year The comet will then be a faint nebulous star not far from Orion But with regard to this matter of search it may be said that it has already begun chiefly by means of photography it being thought that this auxiliary to science might make visible fainter objects than the eye can see

In July of this year the comet held its course in the morning constellations and was then badly placed for northern observers. It is so well placed, however, for southern observers that there is a hope that some observatory south of the line may have the good fortune to pick up the comet before the lengthening nights will enable northern observatories, armed with huge telescopes, readily to pick it up in the northern autumn From September 1909 to March 1910 the comet will be well situated for observers all over the world, being then high up in the midnight sky

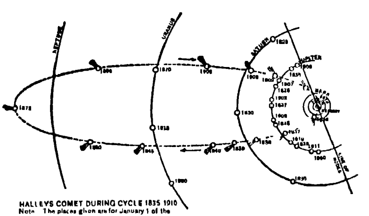
By the month of April, 1910 it will have passed right round to the evening sky, and toward the end of the month it will be lost in the rays of the sun. During May it is for a brief time a morning star but in June it has again stolen round to the west and should in that month be an object of conspicuous brightness in the evening sky of southern latitudes. It will remain an evening star till October of that year when once more it will pass behind the sun and then will appear as a morning star By this time however it will be rapidly decreasing in brightness and will soon be lost to view

There are few more interesting chapters in the history of astronomical research than that which tells the tale of the tracing back through the long centuries of this remarkable comet Chiefly through the devoted labors of a group of classical and Oriental scholars we can trace back the appearances of Halley's comet through twenty centuries surely a long enough period to give it a distinction among comets

Some of these appearances are of unique interest On the Bayeux tapestry there is a famous picture of the comet which appeared in 1066 and which William the Conqueror regarded as a herald of victory for his arms Hind proved that this fateful star was none other than Halley's comet

Then again there are many references in classical literature to the appearance of various 'fearful stars' some of which can be claimed as returns of Halley's comet

It is a marvel that the deductive minds of many of the ancient philosophers did not see a connection—as they did in eclipses between regularly recurring phenomena. Possibly the fear which these supposed messengers of doom raised in the hearts of all, learned or unlearned may have led the ancients to leave comets alone



HALLEYS COMET DURING CYCLE 1835 1910
Note The places given are for January 1 of the dates indicated

It is to Edmund Halley the contemporary and friend of Newton that we are indebted for lifting comets from the region of superstition to the calmer sphere of pure geometry At Newton's request he undertook a thorough investigation of their movements and into the laws which controlled these movements The 1682 comet especially held his attention His keen mind soon traced a connection between similar appearances separated by seventy six years and on working out the orbit of the comet which will now forever be inseparably connected with his name he boldly declared that it would again appear in 1758 It was seen for the first time on December 25th of that year by an amateur astronomer in Saxony Thus for ever the mystery which had gathered round comets was dispelled

There are one or two very interesting questions connected with the return of this comet Of these one is the constitution of these bodies The usually accepted view is that they are composed of myriads of meteors at a very high temperature But this does not explain their appearance thoroughly It is indeed rather an imperfect explanation of the tail

Then do comets grow fainter each return? The belief prevails that they do A comparison of the forthcoming appearance of Halley's comet in 1910 with the magnificent drawings made by Sir John Herschel of the 1835 appearance should do much to settle this question

It is said that there are planets exterior to Neptune Dr See of Mare Island Observatory has even given them a local habitation and a name If there are extra Neptunian planets, then they should make their presence felt by perturbations of such comets as pass out beyond the orbit of Neptune We have already referred to the near approach of Jupiter to Halley's comet in 1835. This approach would have the effect of pulling the comet back in its orbit, and thus by decreasing its centrifugal force bring it back more quickly again to the sun. Every planet circling round the sun tugs at the comet more or less, now hastening, now retarding its journey Because of such "interferences" its path round the sun is a sinuous curve, and sometimes because of hindrances by the way, it takes seventy-seven years to return, while at other times it is incontinently pushed onward and its round is seventy-five years.

Thus if there are planets beyond Neptune they will make their presence felt in disturbing the comet as it passes its aphelion goal.

Enough has been said to indicate how much interest attaches to the appearance of this comet in 1910, and how eagerly its coming is being watched and waited for

Status of the Birkeland-Eyde Nitrogen Reducing System.

It may be of interest to present some of the leading points regarding the present state of the nitrate industry in Norway, using the Birkeland and Eyde electric arc furnace. In this process, the gases coming from the furnace are rapidly cooled so as to prevent a decomposition due to the heat. In this way the yield is increased Since 1905, when the first plant was started at Nottoden Mr Birkeland has been making researches with a new tubular furnace On the other hand, the Baden Aniline and Soda Works, of Ludwigshafen which is associated with the Norwegian enterprise is also studying a new type of tubular arc furnace but without the use of a magnetic field for blowing the arc It appears to give satisfaction and will soon be used experimentally in Norway The question of fixing the nitrous vapors industrially has given rise to many researches At Nottoden, the processes are kept secret as much as possible, however The gas coming from the furnace is taken to oxidizing towers, where they remain for a certain time and in this part the nitric oxide is finally transformed to nitrogen peroxide. The latter is passed into large granite towers of 35 square yards section and 60 feet height and the gas is acted upon by a water spray Nitric acid of 25 per cent strength is thus formed and this can be used for preparing the nitrate of lime, which is used as a fertilizer There remains 20 per cent of nitrogen peroxide in the gas coming from the towers, and it is passed into wood towers resembling the former and is there acted upon by the alkaline solution such as carbonate of soda or lime water After this treatment the gases do not contain more than 3 to 5 per cent of the peroxide The preceding products allow of obtaining nitrate of lime by neutralizing the nitric acid by roughly broken limestone, and the bath is evaporated by the waste heat of the furnace The nitrate of lime for chemical purposes is delivered in blocks, while for agricultural purposes it is crushed and sifted On the other hand the treatment in the towers by the carbonate of soda solution yields nitrite and nitrate of soda The pure nitric acid coming from nitrogen in this way gives rise to products which are of value for pyrotechnics as it is found that the impurities in the industrial products often cause changes in the material and these give rise to accidents. The present acid is almost entirely pure and so is well adapted for this purpose As to the value of Norwegian nitrate for fertilizing H De Felitzen finds that for oats the yield per acre is greatly increased Without fertilizer we have the figure 4 2, with natural Chile nitrate it is 6 1, and with Norway nitrate it reaches 7.1 It is probable that 200,000 tons of Norway nitrate will be produced in 1913 and 125,000 tons in 1911.

Grinding Cement

Fineness of grain is greatly to be desired, both in finished cement and in the raw materials of which it is made In the new Pfeiffer cement machine the process of grinding is kept separate from the expulsion of the meal, or product of grinding. The last-named operation is effected by means of a fanning mill of peculiar construction which, without employing any sieves, delivers a product of very fine grain. The machine requires much less power than the ordinary machine so that a very fine cement can be produced more cheaply than common cement is produced by the usual methods.

◆ ◆ ◆

It is gratifying to learn that the application of block signaling on the railways of the United States is increasing, although not very rapidly The last report of the Interstate Commerce Commission shows that the total length of road operated under the block system at the beginning of the year was [illegible] miles, a net increase over the previous year of [illegible]. [illegible] increase is attributed to the financial [illegible]

THE WIESEN VIADUCT.

BY OUR PARIS CORRESPONDENT OF THE SCIENTIFIC AMERICAN.

[illegible] piece of railroad construction in Switzerland which presents considerable interest is the great Wiesen viaduct, which has been building for some time past. The viaduct's central span is one of the longest as well as the highest to be found in the country

The present viaduct forms part of a new section of railroad of short length which has been undertaken within a recent period in the region lying in the eastern part of the country The line belongs to an extensive system of railroads known as the Rhätische Bahn, and it is designed to give a long needed passage through the picturesque Davos-Landwasser valley for up to the present the valley has been traversed only by an ordinary road Hereafter the well known mountain resort of Davos will have a direct connection with the region lying to the south The line thus gives an outlet to the center of the Graubunden canton, and passengers can easily reach the different parts of the Engadine region by rail The new railroad section will thus be a great advantage for Davos, so that the resort which is already much frequented will have a still greater development after the railroad line is finished. Connection is now made with the Abula railroad, which is another of the Swiss lines recently built in this region

Work on the construction of the new line, known as the Davos-Filisur route is actively under way at the present time The railroad is of short length like many of the mountain lines in Switzerland for it is scarcely over 11 miles long Still it presents many interesting features. A gage of 1 meter (39 37 inches) is employed in this case Davos the starting point of the line lies at an altitude of 5 019 feet above sea level, while the southern terminal at the locality of Filisur has an altitude of 3 521 feet, so that the gradients on the section are considerable The maximum gradient is 35 per cent and the minimum radius of the curves 380 feet. The track is laid upon steel ties. Following along the valley of the Landwasser which after Schmelzboden narrows to a deep gorge lying between high rock walls the route is one which tourists will find agreeable for its picturesque character On the section between the above locality and Wiesen a considerable amount of work has been done in the way of tunneling and building viaducts In all, there are six tunnels, the longest of which is the Silberberg tunnel In its construction springs were met with which gave some difficulty After crossing the mountain torrent of Monastein, the line reaches the locality of Wiesen near which is situated the great viaduct, lying between Wiesen and Filisur The main central span lying over the Landwasser stream is 182 feet, and the height of the arch above the level of the stream is about 300 feet. It was difficult to obtain suitable building stone in the region Concrete was used for the main body of the work and hewn granite for the facing At the top of the arch the width is 126 feet and at the base the width is 165 feet The thickness at the summit is 6 0 feet and at the bottom 10 feet for the masonry On each side of the main arch there are two arches of smaller size having 65-foot span and lying at the same height above the level of the stream In order to carry out the work of building the principal arch there was thrown across the stream between abutments an iron trelliswork bridge of 3 feet width which was held upon two suspension cables these latter being anchored at either end The viaduct is built according to the designs of M Hans Studer, one of the leading engineers of the road

◆

The Current Supplement.

Thanks to the speed of modern steamers and the development of the railroad system in India, the base of the Himalayas is now only twenty days' journey from Mediterranean ports. Hence mountain climbers who wish to distinguish themselves by lofty ascents or explorations have undertaken summer expeditions in the high mountains in northern India. In the first rank of these explorers stand Dr and Mrs Bullock Workman, who since 1898 have made five expeditions in the Himalayas Their latest exploits are recounted in the opening article of the current SUPPLEMENT, No 1754. D. Geyer contributes much curious information in an article entitled "Snail Gardens." Dr Reiner Müller writes on the subject of the inheritance of acquired characters in bacteria, and shows how it is possible by artificial means to impress upon a living organism a new and definite character which is hereditary and which remains constant through a vast and indefinite number of generations. An approximately correct idea of the form of our planet is a comparatively recent acquisition of science Dr Rivet of the French Equatorial Geodetic Expedition tells us how this new knowledge is obtained The yeast cell and its lessons are taken as the subject of an instructive article by W Stanley Smith. The [illegible] process of cutting metal is a new technical [illegible] [illegible] discussed by E. F. Lake. Maria Parloa's excellent monograph on the canning and preserving of fruit is continued Twenty five years have elapsed since Arrhenius advanced the theory that acids, bases, and salts in aqueous solution are dissociated into their constituent ions Now that the storm of contention aroused by this doctrine is clearing it may not be inappropriate to consider more calmly this proposition of Arrhenius's, to reinspect the foundations and to weigh without prejudice the successes and the failures of the ionic theory This has been done by Gilbert Newton Lewis in a thoughtful article entitled "The Use and Abuse of the Ionic Theory The Engineering Electrical and Trade Notes will also be found as usual

◆

The Glidden Tour

The sixth annual tour of the American Automobile Association better known as the Glidden Tour was completed at Kansas City Mo on the last of July after a more than usually strenuous journey of fifteen running days from Detroit *via* Chicago to Denver and back to Kansas City

It is impossible for us with the space at our disposal to give even an outline of the performances of the various cars or the incidents of the trip but as at least half the space in a number of automobile trade journals have been devoted to such details for three successive weeks it is perhaps hardly necessary

There are however several features of the tour worthy of especial mention even in a non-specialist paper

The roads are agreed by a number of veteran Glidden tourists to have been the worst ever encountered varying from axle-deep sand to mud as deep and perhaps worst axle-deep ruts in hard baked gumbo In several cases the entire crew of a car was thrown out by crossing too swiftly in descending a hill a concealed water bar or similar obstruction grass hummocks and even bowlders grazed axles and under pans and bridges on the prairie roads had to be repaired before safe for passage Considering these difficulties the fact that 8 cars finished with perfect road scores (without losing marks for delay breakage repairs or adjustment *en route*) as many as 21 out of the 32 contesting cars covering the first 810 miles to Minneapolis over perhaps the worst roads encountered without being penalized is strong testimony in favor of the claim that the reliability of American manufacture has reached something like perfection Even the expected spring troubles were conspicuously few

Whereas in former years the Glidden has been considered to be a big car tour small cars having hardly a fair chance to make a showing proportionate to their cost an attempt was made this year in the system of marking and distribution of the trophies to place the smaller cars on equal terms The result however still shows that the best low powered car is hardly equal to so strenuous a journey

Great hospitality was shown to the tourists at practically every town and village passed Detroit Minneapolis and Denver particularly distinguishing themselves and farmers' families lining the route even in remote districts The latter seem to be overcoming their hostility to horseless vehicles not merely making way for the automobile and taking its dust with a better grace but themselves adopting its use to avoid those alternatives The interest shown by the agriculturist in the tour should benefit participants in the latter commercially in these days of high priced grain and promise of abundant crops as well as materially assisting the universally beneficent cause of good roads

The Glidden trophy for the largest cars and the Hower trophy for runabouts were won by Pierce Arrow' cars three of which finished with perfect road scores the two winners actually having no marks deducted for any re-adjustments to be made at the finish to put them in the perfect condition in which they started which is certainly a most remarkable showing

The Detroit prize for intermediate cars was won by a Chalmers-Detroit car two of the three Premier cars entered also finished with perfect scores

A remarkable record was made by a Rapid commercial delivery truck which was sent on the unaccustomed 2 600-mile journey by its enterprising manufacturers carrying over a ton of baggage and accessories for the tourists on solid tires It not only rendered yeoman service but actually would have been unpenalized on several of the worst days' runs had it been competing with the touring cars and climbed Pike's Peak as a diversion during a pause in the tour

◆

BLERIOT'S CHANNEL FLIGHT AND OTHER RECORDS IN FRANCE

We reproduce herewith several photographs showing the start of Bleriot across the English Channel, and also showing him flying above the Channel when beyond sight of land These photographs give an excellent idea of the birdlike appearance of Bleriot's monoplane when in flight. A full description of his record flight and of other records which he has made appeared in our last issue

The extremely rapid progress being made in aviation in France is truly astounding One of the men who has made extraordinary progress is M Roger Sommer His record to date is truly remarkable and shows that when one once learns to fly an aeroplane there is a fascination even greater than that experienced with the automobile During six consecutive days from July 13th to 18th inclusive M Sommer made the following flights July 13th two flights of 15 and 19 minutes On the 14th a flight of 27 minutes at a height of from 30 to 60 feet covering a distance of 12 kilometers (7 5 miles) outside the limits of the aerodrome within 10 minutes On July 17th a 30-minute flight during which 12 liters (3 2 gallons) of gasoline were consumed and on the 18th a flight of 1 hour and 4 minutes On July 27th this time was increased to 1 hour 23 minutes and 30 seconds On August 1st he flew 1 hour 50 minutes and 30 seconds beating all French records Three days later he made a flight of 2 hours and 10 seconds which up to the time of our going to press is the longest record made by a foreign aviator M Gaudart is another beginner who has recently met with considerable success On July 18th at Juvissy he made three circuits of the aerodrome in a gusty wind covering a distance of about 41½ kilometers (25 miles) Starting at 3 14 A M on August 7th in the moonlight he made a flight lasting 2 hours 27 minutes and 15 seconds the altitude attained varying from 20 to 90 feet This surpasses the record of 2 hours and 20 minutes made on December 31st last by Wilbur Wright and is an endurance record for an aeroplane

Capt Ferber made several flights on the Champ de Mars on July 18th with his Voisin biplane Two days later he made six successful flights at Belfort after which he shipped his machine to Vichy for the aviation meet On July 19th Henry Farman made a flight of 1 hour and 23 minutes at Chalons The flight started at 8 17 P M and terminated at 9 40 when the gathering darkness obliged Farman to descend His new machine has the tail placed farther apart than the former one and is fitted with runners instead of wheels The balancing planes are placed between the ends of the main plane On July 21st at Chalons Mr Farman took up Mr Cockburn in a new machine which the latter has just purchased It made a circuit of the camp a distance of about 1½ miles

From the above it will be seen that the aeroplane is making great strides in France No less than forty six machines have been entered for the great aviation meeting at Rheims during the week beginning August 22nd and at this meeting aviation abroad will for the first time be put on a sound footing

◆

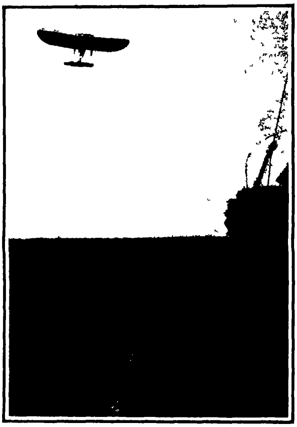
COMPLETION OF THE GOVERNMENT CONTRACT BY ORVILLE WRIGHT AT FORT MYER

With the making of the ten mile cross country speed test by Orville Wright at Fort Myer on July 30th as mentioned in our last issue the government requirements for a heavier than air flying machine were completely fulfilled The speed averaged by the machine carrying Orville Wright and Lieut Foulois as passenger according to the timing of the officers in charge of the test was 42 58 miles an hour On the outward journey when flying somewhat against the wind the machine averaged 37 73 miles an hour while on the return trip the average speed was 47 431 miles an hour As the bonus offered by the government was $2 500 for each mile per hour in excess of forty without taking into consideration fractions of a mile the Wright brothers received a bonus of $5 000 which made a total of $30 000 for their machine

The more one considers this remarkable flight the more the excellent qualities of the Wright biplane and the daring of Orville Wright in making the cross country flight to Alexandria Va stand out With a somewhat smaller machine than that used last year (the planes are 36 feet long by 6 feet from front to rear) some 1 200 pounds of weight was carried at a speed of 42½ miles an hour with an expenditure of not over 30 horse-power This means that the machine lifted 40 pounds or more per horse-power expended and carried this weight at a faster speed than has ever been shown in an official test by any other aeroplane The weight lifted per square foot of supporting surface however was much less than in the case of Bleriot with his No XII monoplane for the Wright machine carried only about 2¼ pounds to the square foot whereas Bleriot lifted over 5 The speed the latter attained in an official test at Douai France last month was 10 miles per hour less than that reached by the Wright biplane in its test at Fort Myer although Bleriot's monoplane had approximately the same horse-power and lifted practically the same weight A comparison of the two machines shows very neatly therefore the greater lifting power of a single deeply curved surface over superposed slightly curved surfaces and brings out the fact that when such a surface is used, as was the case with the Bleriot machine, speed is sacrificed for lifting power On the other hand however as a practical machine for the use of sportsmen the monoplane of Bleriot offers distinct advantages in the way of small space occupied light weight of the apparatus and ready portability After making his 25-mile cross-country flight from Etampes to Chevilly on July 13th last Bleriot dismounted the wings of his machine fastened them to the sides of the body frame and towed the machine over the road on its three wheels to Paris a distance of [illegible] miles arriving there by evening The performance of such a feat shows the superior adaptability for war purposes and for all practical uses of the monoplane type of aeroplane mounted on wheels as compared with the biplane type of machine mounted upon runners and requiring a starting rail and dropping weight to launch it

The fulfillment of the specifications of the United States government for a heavier than air flying machine marks an era in the development of aerial navigation When these specifications were issued in December 1907 the Wrights had not demonstrated any of their claims the chief of which was that they had flown for 38 minutes more than two years before Santos Dumont Farman and Delagrange had made little more than jumps and the art of aviation was in its infancy as far as any practical demonstration of what had already been done by the leaders was concerned The specifications issued by the War Department required an endurance flight of one hour with a passenger a cross-country speed test with a passenger for a distance of ten miles in which a speed of not less than 38 miles an hour must be shown and the carrying of sufficient fuel for a 125 mile (3 hour) flight These specifications were so rigorous that even the most hopeful aviators were doubtful whether they could be fulfilled but when Wilbur Wright flew for 2 hours and 20 minutes on December 31st last in France all doubt was dispelled as to whether or not the Wright brothers could fulfill the specifications Nevertheless the best speed shown by the Wright machine in France in the different speed tests there did not exceed 38 miles an hour very much and there was consequently considerable doubt as to how fast the machine could travel and how much bonus Orville Wright would win After making the hazardous trip over several deep valleys and high hills he expressed his belief that had there been no wind to drive him out of his course he would have made 44 miles an hour and received the full bonus The height which he attained in passing over the valleys was 400 to 500 feet When the fact is considered that had the motor stopped both men in the aeroplane would have been in imminent danger of losing their lives from the descent of the machine on the tree tops one can readily see that the making of this flight required more daring than the making of a flight across the English Channel Not only this but two lives were in jeopardy all the time

A glimpse of Bleriot shortly after his start.



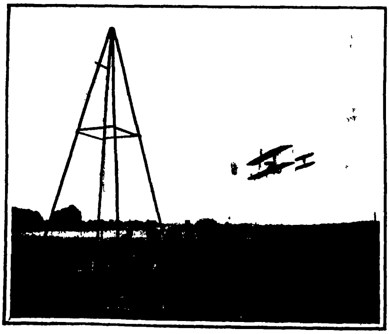
Bleriot in mid-Channel

BLERIOT'S FLIGHT ACROSS THE ENGLISH CHANNEL.

There are several new aviators in France who almost daily are making new records. Chief among these is M. Paulhan, who, with his Voisin biplane fitted with a tail and a Gnome revolving-cylinder motor, on July 19th made a cross-country flight from Douai to Arras, a distance of 13 miles. The flight was made in 22 minutes, at an average speed of 35.4 miles an hour Next to Bleriot, M Paulhan holds the record for cross-country flying in France. He also holds the record for height, having flown to a height of 120 meters (393.8 feet), and thereby beaten Wilbur Wright's 110-meter (350-foot) record made on December 18th last at Auvours. Some of M Paulhan's recent records made at Douai are as follows 12 kilometers (7½ miles) in about 15 minutes at a height of 30 meters (98 feet), July 23rd, 1 hour 17 minutes 19 seconds, covering an official measured distance of 48.178 kilometers (30 miles), but actually traversing a distance of 70 kilometers (48.5 miles), when the wide turns are considered

July 18th, M Paulhan raced M Bleriot with the latter's biplane at Douai, over a distance of a kilometer (0.621 mile) in a semi-circle. This was the first time two aeroplanes have engaged in a race and the fact that these were a biplane and a monoplane with two distinctly different types of motors made this race all the more interesting M Bleriot won in the time of 1:09 an average speed of 32.4 miles an hour, while Paulhan's time was 1:37 an average speed of 23 miles an hour The same day M Bleriot won the Prix du Nord by covering 2 kilometers (1.4 miles) in 2 minutes 29 seconds

Although America was the first to secure an aeroplane for the use of its War Department, several other nations are quietly working to develop machines of their own In England, Capt Cody who however has not been aided very much by the government has lately been making successful flights with a biplane nearly twice the size of Wrights' On July 21st he flew 4 miles above Laffan's Plain near Aldershot This is the first biplane according to Capt Cody in which every possible effort has been made to avoid head resistance He believes that his machine has less head resistance than any other so far constructed of the same size and with an engine of about 30 horse-power he has flown successfully at good speed The French government also is experimenting with a biplane but up to the present no attempt has been made to purchase such a machine from any of the numerous constructors. Orville Wright expects to go to Germany very soon, with the idea of selling a number of machines to the German government Italy has already acquired one Wright aeroplane and will probably have several more soon The Austrian and the Russian governments are also interested in aeroplanes for war purposes. Up to the present time however our country and Italy are the only ones which have aeroplanes, and which are ready to purchase more of these machines in the near future It is probable that new specifications in which greater requirements will be made will be issued within a short time by our War Department



A short turn.

The Wright machine in a sunset flight.

THE LAST WRIGHT FLIGHTS AT WASHINGTON.

AN AMERICAN FORESTRY SCHOOL.

BY DAY ALLEN WILLEY

One of the Eastern States to which forestry is of really vital importance is Pennsylvania, for the reason that such a large revenue has been secured from its timber interests. Only ten million acres of its area has thus far been devoted to agriculture, the lumbering industry being very extensive over the balance of the State on account of the forest growth. In Pennsylvania, as well as other States the lumber industry has been accompanied with great waste owing to the crude methods employed—the large quantity of valuable stumpage being left, young trees broken down in felling larger ones while the practice of "skinning" the forests or cutting down the most valuable trees regardless of the destruction to the young growth has in itself caused a great loss.

Several large railroad companies obtain much of their timber from the State especially the Pennsylvania Railroad Company, which has introduced a forestry system on its own lands that has resulted in much practical benefit The most notable movement however, is one which has been taken up by the State authorities in the creation of the only undergraduate forest school between Michigan and Maine. The school has been planned on a very broad scale and is intended not only to educate those who attend it in every branch of forestry but to conserve this most important resource so that the timber supply of the State will be permanent.

The institution itself is located in Center County where an excellent opportunity is provided for a study of the various branches but in addition the students are sent to various portions of the State as well as out of Pennsylvania for additional study and practice The State College as it is termed gives special attention to field work in addition to the routine of the class room and lecture room In connection with the earlier courses in forestry the men are taken into the field where they study each kind of tree its form, its bark leaves buds and flowers until they are perfectly familiar with the trees and the material with which they will work Following this they carry on during the fall season the work of collecting the fruit and seeds of various trees and their storage dry in bags or buried in moist sand In the spring the seeds are taken and planted in forest nurseries the students doing the actual work of planting and cultivation Numerous trips are made in the vicinity of the college to study natural reproduction of the forest Near by is a State reserve of several thousand acres and the State Forestry Reservation Commission has given the college an annual privilege of going upon this reserve for study and demonstration in forestry There is no other forest school in the country that has so large a tract of wild land so near at hand and so available for study at all times. Last year one of the advanced classes made a topographical sketch of a large gap in the hills which supplied the college with water, and followed this with a forest map, showing the nature and amount of timber growth and from notes taken in the field worked out a plan for the future management of the watershed

At the State College the course of training includes not only preparation for forestry in the East but forestry in the West As an illustration the students are even instructed in the use of pack animals, which are so much depended upon in the great national forests where the only route may be a pony trail The course of instruction includes the care and use of ponies and mules the methods of loading them also riding Pack trains are fitted out and the students make expeditions as they would in the Rocky Mountain region or on the Pacific coast Two weeks at the end of the junior year are spent in camping upon some large wood lot in the State where the boys get very practical training in camp life in the estimating of timber and its actual measurement by various methods rapid sketching and mapping of forest areas and in study of tree growth by analysis of tree trunks From the data obtained in the field a map is made and a plan drawn up for the correct management of the wood lot There are many locations in Pennsylvania which are admirable for field work because within a small area may be a large number of varieties of trees forming a miscellaneous growth An opportunity is also given the students to investigate the different varieties of soil the extent of the watershed and to obtain other data which

A class in silviculture gathering seed of maples in a large sheet

AN AMERICAN FORESTRY SCHOOL.

will be of great value in connection with their future vocation

During the last year the members of the graduating class are put through a very rigid test being required to spend at least four weeks in some forest region either in Pennsylvania or other States They are sent to a lumber camp where they make a study of lumbering as associated with forestry This month in the lumber woods is taken as a part of a course in lumbering in which each operation from the log in the tree to the finished product is thoroughly discussed The men are provided with an outline to aid them in their studies and will prepare a complete report on the lumbering operation which they investigate They are also placed during the summer vacations where they will get the most practical experience in forestry

To get the men in touch with practical forestry as it is being carried on by private individuals through the State and in its various forest nurseries as well as the work of manufacturing companies who put out tools and equipment used by the forester one or more trips are made each year by the juniors and seniors and it is planned to increase in so far as possible the usefulness of these trips The students have visited various plantings of locust made by the Pennsylvania Railroad along its lines between Harrisburg and Philadelphia In these plantations they studied the injury done by the locust borer and by mice and have learned that the locust was not a tree of value for general planting throughout the State At Pottsville the forestry work carried on over the Stephen Girard estate has been carefully studied On this estate extensive planting has been done but without the best results because of injury from fire Stone walls have been built and fire lines or roads established which are as good an example of this method of preventing fire as can be found in the country The advanced students have made trips through the southeastern portion of the State visiting the large forest nursery of the Pennsylvania Railroad at Morrisville which has been established by the Pennsylvania Railroad This is reported to be the finest forest nursery in the United States It had a million and a half of red oak seedlings grown from acorns which were set out in the spring of 1909 Industries associated with forestry such as works showing the way in which wire rope and cable are used in logging operations have been visited and where the students were able to see the making of all classes of saws from the crude material to the finished product

This brief outline gives an idea of the broad and comprehensive scope of the instruction as carried out at this institution but the opportunities for the graduates are such that the school authorities consider the work well worth while There is such a constantly increasing demand for the trained foresters that it is much greater than the number who now graduate while the salaries offered make it an inducement to a young man to take it up The college continually has requests from large lumber companies throughout the country for graduates and sometimes undergraduates The United States Forest Service is also another source of employment and this institution has already sent quite a large number into the national forests in Montana and other States In fact the demand for graduates is assuming such proportions that expert forestry will undoubtedly become a vocation which will give many thousands employment and the results at the Pennsylvania institution prove that similar schools established in other parts of the country will be of far reaching benefit in solving the problem of conserving the national woodlands

At the head of the State College is Dr Hugh P Baker a graduate of the Yale Forest School who was also connected for several years with the United States Forest Service The State authorities have provided Dr Baker with a staff of experts so that as already noted not only instruction but field work has been provided in literally every detail which concerns this subject

In Pennsylvania forestry is taken up in connection with the work of the agricultural and mechanical departments of the State University as it is believed this is the best method As forestry is a production of a crop from the soil in a sense it is agriculture and because the utilization of the crop demands considerable knowledge of engineering, the instructors are able to give the students work in the departments of civil, mechanical, and mining engineering—just the kind of employment that they need Consequently the work is closely connected with the vocation of the farmer and the one who completes the course of study with the view of becoming an agriculturist is in a position to get the most and best of his woodland and to make it a permanent resource

It may be added that the length of this course is four years the first two years of which are devoted largely to foundation principles, which are absolutely necessary to the proper training of the forester Beginning with the third year they take the men and give them two solid years of training along forestry and closely related lines In connection with the actual forestry work the students take such subjects as fish and game preservation diseases of trees roads and trails elementary irrigation engineering elements of mining in which they are taught in an elementary way the mining of various minerals the timbering of mines and the laying out of mining claims The students are also given a practical course in timber testing in their mechanical engineering department.

◆

AN ELECTROMAGNETIC DRILL

BY THE GERMAN CORRESPONDENT OF THE SCIENTIFIC AMERICAN

A very efficient electromagnetic drill has recently been designed by the German engineer Burckhardt This machine is intended for use in all branches of the iron industry e g in boiler shops ship yards erecting shops, and the like

The ingenious combination of an electrical motor with an electromagnet adapts this machine to all boring milling countersinking and broaching Electromagnets placed on both sides of the drill spindle throw the machine so tightly against the work as to allow any one of the operations mentioned to be carried out rapidly

A NEW ELECTROMAGNETIC DRILL.

A special attachment on the drill spindle allows the tool to be rapidly and accurately centered on any given point of the working surface The machine is thus adjusted within a few seconds

As represented in the accompanying figures, the drilling machine is suitably suspended for this purpose On horizontal surfaces the drill can obviously be used without any suspension A special device is used in upward drilling

The electromagnetic drill comprises four main parts viz the driving motor the drill proper with its centering device, the electromagnets, and the suspension

The motor armature drives the drill shaft through a normal toothed wheel gearing The shaft can be axially displaced with a view rapidly to adjust the drill point on the center mark The balanced suspension device can be used for the same purpose

The electromagnets are placed on a yoke pivoted in the plate extension of the machine, and fixed with a nut The magnet yoke, with its two coils, can accordingly be adjusted to any desired angle A clamp screw is used to hold it in position

The pole pieces fitted to the ends of the magnet coils are interchangeable, their length and shape being adapted to the tool in actual use, as well as to the form of the working surface. The [illegible] must be held as tightly as possible against [illegible] with their entire surface. The suspension [illegible] should be fixed at such height above the working [illegible] as to allow the drill to be rapidly conveyed to [illegible] point of the shop. The tool is preferably a [illegible] drill of hard tool steel.

By employing pole pieces of different heights, [illegible] of different lengths can be used.

◆

The Psychology of Reading.

Examinations made by Erdmann and Dodge may serve as a foundation for the psychology of reading, and through careful experimental observation these scientists have reached results of extraordinary interest.

Hitherto two views have prevailed, the one being that reading was effected solely by spelling, each letter therefore being grasped and perceived for and by itself the other being that the words were grasped not exclusively letter by letter but in small groups of letters in the same spaces of time

We learn from their report in the Zeitschrift fuer Psychologie und Physiologie der Sinnesorgane that Erdmann and Dodge first ascertained through reflection of the left eye while the head was kept in a steady position, that in reading an easily comprehensible text there is a regular change between pauses of rest for the eye and its movements. The number of these pauses, however, is much smaller than the number of the letters over which the eye glides, and it remains, in the case of the same person almost unchanged as long as a fluent text is used If the text becomes more difficult in the meantime the number of pauses is increased a little, and where attention is given exclusively to the formation of words, as in proofs" the number becomes three times as large

So much having been ascertained, the next object was to ascertain whether reading was effected during the pauses of rest or whether the letters presented themselves with sufficient distinctness while the eye was moving to the right Through perfectly exact observation and calculation both investigators came to the conclusion that reading was effected exclusively during the pauses of rest On an average the eye glides during a definite movement on the line over a space of 1 52 to 2.08 centimeters a space that contains about twelve to thirteen letters. The rapid change of the black and light textual elements—the letters and the interstices—makes it more impossible for the eye to recognize the letters while it is in motion It was also ascertained that by a very brief exercise of vision, while the eye is still four letters without exception five at the most, can be recognized at the same time, even when they do not occur in a sequence of words In the case of such a sequence, however, four or five times as many letters can be read during the same interval of vision In the short pauses of rest while reading one recognizes the words solely from their optical collective form if the letters are not too large, and such recognition is by so much easier as the words show themselves more characteristic and fluent to the reader Even a beginner can therefore with a little practice enable himself to read not only without spelling but with a visual grasp of whole words at a time How far this capability may reach depends on the optical memory of the reader

Handy Man's Workshop

HOW TO MAKE CONCRETE POTTERY—V

BY RALPH C. DAVISON

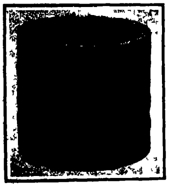
(Continued from the issue of July 31st)

After having mastered the processes of modeling and casting as explained in the previous articles the craftsman can now take up the decorative features. The possibilities of ornamentation one can say are almost unlimited with this material. Various effects can be obtained. One can reproduce antiques which can hardly be told from the originals and original designs embodying various colors can be made which will compare favorably with modern clay pottery effects. *Owing to the material used the texture obtained* is one which is full of life and sparkle. It has a distinct characteristic of its own which cannot be obtained in any other material.

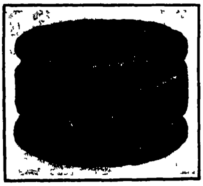
As a specific case of what can be done along these lines we will take the copy of an antique which is illustrated herewith. This was made as follows. It was first cast with perfectly smooth sides, a mixture of one part Portland cement to two parts of fairly coarse brown sand being used. After pouring this mixture it was allowed to set in the mold for from eight to twelve hours. The mold was then removed and the piece was found to be in a more or less soft state. That is it had to be handled carefully and the concrete had not become so hard that an impression could not be made in it with the sharp point of a knife. the design as shown was then marked on the surface, and in turn it was cut and dug out by a strong knife blade. A straightedge was placed along the various lines being used as a guide for the blade. The depth to which the design should be cut varies according to the size of the piece but in small work usually from one-eighth of an inch to three-sixteenths of an inch will give the most effective results. If for any reason one cannot commence the work of cutting out the design within twelve hours after the piece has been cast *or* until the piece has become quite hard it will then be necessary to use a small hammer and chisel with which to cut out the design. Care should be taken however in using these tools not to strike too hard a blow for if one hits too hard the piece may break although in antique work if the edges of the cut-out design are more or less irregular it makes the piece so much more effective.

In preparing any article for color inlay work which has been modeled and built up on wire forms as explained in numbers I and II of this series such as a vase or other piece the design must be cut out previous to the inlaying of the colors exactly as has been just described for antique relief work.

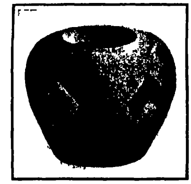
If, however, the piece to be inlaid is to be made in a mold as described in articles III and IV the mold can be prepared to form the desired depression in which case the design will be cast in the piece. For complicated designs of this character a clay model must be provided from which the plaster mold is made. But in simple designs such as illustrated the piece which *is to form* the recess can be attached to the inside of the outside mold as shown in Fig. 24. This can be made of wood and can be secured in place by brads. It should be located in the proper position and should be of the exact size and shape of the outline of the design and at least one-eighth of an inch thick. Shellac and oil the piece well before pouring the cement and allow a good bevel or draft on all of the edges so that it will draw out easily from the cast and thus leave a good clean, sharp edge in the cavity into which to lay the colored cement.



VASE WITH ELABORATE COLOR DESIGN



COPY OF AN ANTIQUE



A GOOD EXAMPLE OF COLORED CONCRETE WORK

[illegible] attempts have been made to produce satisfactory color work in cement, but until of late these attempts have been most unsatisfactory. This was largely due to the fact that ordinary Portland cement is of a gray color and on mixing it with the various color pigments the result was a decidedly dirty or dead tint of the color used similar to that which would be produced in water colors by mixing them with water which had already been discolored by India ink or lampblack. Another cause of unsatisfactory results along these lines was the fact that many of those who experimented did not use the proper color pigments the result being that the colors faded out on exposure to the weather. The first cause of not being able to produce true tints can now be overcome by the fact that a really true white Portland cement is being manufactured. This now can be procured from almost any cement dealer. By using this as a base with which to mix the pigments true clear colors can be obtained and by the use of nothing but good mineral pigments known as lime or cement proof colors it is possible to produce shades which will be absolutely permanent.

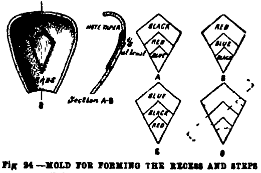


Fig 24—MOLD FOR FORMING THE RECESS AND STEPS IN LAYING THE COLORED CEMENTS.

The writer has experimented largely with coloring *matters from this country as well as from abroad.* Many of the coloring matters obtained from abroad are very good but their cost is naturally higher than those which are made in this country.

As before stated mineral colors are those which give the best and most permanent results. They all come in powdered form and should be mixed with the dry cement and marble dust or white sand as the case may be until the whole mass is of a uniform tint throughout. After having mixed them as above water should be added and the whole mixed into a mortar.

The following pigments which can be procured from almost any of the large manufacturers or dealers in dry colors will give satisfactory and permanent results.

Dry Pigments	Resulting Color
Red oxide of iron Venetian red	Red
White Portland cement	White
Ultramarine blue Oxide of cobalt	Blue
Chromate of lead Yellow ocher	Yellow
Chrome oxide of copper	Green light
Carbonate of copper	Green dark
Lampblack Torch black Black oxide of copper	Black or Gray (according to quantity used)
Ordinary Portland cement	Gray
Burnt umber	Brown

The amount of coloring matter to use in proportion to the cement depends entirely upon the depth or shade of the color desired. By mixing up small specimens of the color with various proportions of cement and making small test pieces of mortar and then noting the color of these after they have dried out one can readily determine the proper amount of coloring matter to use. It is always better to weigh the amount of pigment used rather than to judge the amount by bulk for by weighing a much more uniform result can be obtained.

For ornamental work where a wide range of colors is desired they can be procured by the same means as is used in water or oil color painting that is by mixing together the three primary colors which are red yellow and blue. From these three colors can be obtained every color or tone that may be required. Thus blue mixed with yellow produces green blue mixed with red produces violet and red mixed with yellow produces orange etc. In combining the coloring matters always do so while they are in a dry state and thoroughly mix or grind them together before adding them to the white cement.

The method of laying these colored cement mortars in the design is as follows. First enough water must be added to the dry mass to allow it to be mixed to the consistency of a thin paste. Then the design which has already been cut out as previously explained should be thoroughly wet down by sprinkling with a wet brush.

If a varicolored design is to be inlaid it is always well to lay in all of one color at the same time as is illustrated in Fig. 24. In this case we have figures *A* *B* and *C* which are to contain the colors red blue and black as indicated. First with the aid of the blade of a penknife or any other handy tool according to the size of the work lay the red cement in the design *A* as shown at *D* by the dotted lines. Let it come level with or even a little higher than the face or body of the vase or piece which is being inlaid also let the colored cement project beyond its position in the finished design as indicated by the dotted lines. Now turn the vase around and lay the red cement in the designs *B* and *C* letting it project beyond its position as was done in the design *A*. The red cement which has been laid in the design *A* will now be set enough so that a straightedge made of a flexible piece of wood or other material such as cardboard can be placed over it in the position of the finished design as indicated at *D* by the dotted lines.

The sharp edge of a knife can now be used to cut away the surplus cement which projects beyond the edge of the straightedge. In cutting away the surplus cement always cut away from the finished design. Proceed to cut away all other surplus cement from the other three sides of the design as just described and then in turn treat the designs *B* and *C* in the same manner. Now lay in the blue cement in all of the designs in a similar manner and then the black cement. If by chance any of the colored cements have gone beyond the designs and onto the *face of the* vase scrape them off before they harden and then with the back of the blade of the knife which is more or less blunt run around the outline of the designs as well as between the colors using a straight edge as a guide. By doing this a distinct parting line is produced between each color and a better effect can be obtained.

The colored cements which have just been inlaid must of course be cured so as to harden them up. This is done by sprinkling them with water as explained in a previous article.

The next article will treat of the molding of ornamental relief work and how to cast it.

(To be concluded.)

◆

THAWING DYNAMITE

Dynamite must be carefully and thoroughly thawed to make sure that it will explode and do good work. The proper thawing of dynamite is a simple operation and is done safely. A dynamite cartridge can be lit with a match and burned without explosion almost always. It must not be laid against a hot steampipe or smokestack or be buried in hot sand or stood near a fire. Use a heat that can be controlled and that can never rise above 100 deg. even when neglected. Dynamite begins to undergo a change at [illegible] deg. F and from that temperature up becomes more sensitive to shock until at a temperature of about [illegible] deg. it will explode simply from that heat. The best thawer for dynamite is one in which the cartridges are in serted in tubes that are completely surrounded by hot water The sticks may be carried to the work in this thawer Never place the thawer over a fire, or try to heat the water while the dynamite is in it For thawing on a large scale a building heated with steam or water coil is good, provided primers men, and tools are kept out

AN ELECTROLYTIC RECTIFIER FOR CHARGING IGNITION BATTERIES.

BY FREDERICK E WARD

It is well known that small storage batteries, such as are used for automobile ignition are very easily charged by connecting them to a direct-current house lighting circuit through a suitable resistance but where the current supply is alternating many have supposed that good results cannot be obtained without the use of complicated and expensive apparatus for converting the alternating into direct current By following out the instructions given below however an electrolytic rectifier suitable for charging a six volt sixty ampere-hour battery from 110 volts can be made and used at home with small expense and satisfactory results

There are two parts to the required apparatus—the autotransformer for reducing the voltage of the line from 110 to that required by the battery and the electrolytic cell for rectifying the current or causing it to pass always in the same direction

The autotransformer is shown by the drawings in Fig 1 It consists of a single coil of magnet wire wound on a rectangular wooden spool inside of which a bundle of steel strips is afterward placed to form a core The spool is best made of well seasoned white pine or whitewood as these soft woods are readily obtained and easy to work It is a good plan to dry the wood thoroughly in an oven before it is cut up

For the body of the spool four pieces 2 1/16 inches wide 4 inches long and not thicker than ¼ inch are required These should be securely glued and nailed together so as to form a rectangular tube 4 inches long and measuring 1 9/16 inch by 2 1/16 inches on the inside For the heads two pieces ½ inch thick 3½ inches wide and 4 inches long are needed Through the middle of each a hole about 2 1/16 inches wide by 2 9/16 inches long should be cut to fit snugly over the ends of the tube When the heads are securely glued to the central tube and braced by a few wire nails driven into them from the inside the whole will form a strong spool having a space 3 inches long between the heads for the winding The corners of the tube where the wire is to be wound must be well rounded off with a file to avoid the difficulty of having to bend the first layer of wire around square corners In one of the heads two small holes and a saw cut must be made as shown at 1 2 and 4 in Fig 1 while in the other head only one saw cut 3 is needed These holes and slots are for bringing out ends and loops in the winding so that connections may afterward be made to different parts of the latter On the heads of the spool the numbers 1 to 4 should be plainly carved to avoid confusion

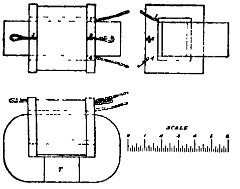

Fig 1 THE AUTOTRANSFORMER.

The coil is to be wound of No 16 double cotton covered magnet wire of which about three pounds all in one piece will be required This is to be wound on the spool in eight layers of about fifty turns each as follows First pass about 4 inches of one end of the wire out through the hole numbered 1 and then wind on six even layers like thread on a spool The work can be done most easily by clamping the spool on the face plate of a lathe and turning it over slowly by hand as the winding progresses It is well to give each layer a coat of shellac before winding the next When the six layers have been put on make a short loop in the wire at saw cut marked No 2 and allow the loop to project outside an inch or so as shown Continue the winding as before and at the end of the seventh layer leave a similar loop at saw cut No 3 and finally finish by putting on the last or eighth layer and passing the end of the wire out through hole No 4 After the winding is complete it should be protected from possible injury by a covering of two or three layers of cloth fastened with glue or shellac

The core is to be made of strips of thin sheet iron or sheet steel cut two inches wide One sixty-fourth inch is a desirable thickness, but anything less than 1/32 inch will answer About eleven pounds will be needed for the core, in strips of different lengths varying all the way from 11 up to 21 inches long Insert the strips into the hole through the spool one by one putting in the longest ones first at the side nearest where the terminals are brought out, and finishing up with the shorter pieces at the opposite side Enough strips should be used to fill up the hole snugly If the strips are rusty it will not be necessary to insulate them from each other but if they are clean and bright it is a good plan to insert an occasional strip of paper so as to divide the core up into groups of half a dozen sheets each

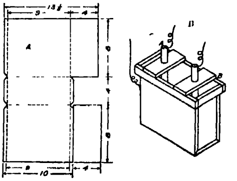

Fig 2 —THE SHEET-LEAD TANK

The strips must next be bent around one at a time so that their ends meet at the side of the coil opposite the terminals Trim off the ends of each strip with a pair of tinner s snips so that they meet without overlapping forming what are known as butt joints Care should be taken that the successive joints do not come in the same place but overlap each other about two inches as they pile up in the same way as the joints in brickwork After the ends are all in place they may be held permanently by wrapping them with a layer of stout cord (not wire) as shown at T Fig 1 This completes the autotransformer though a coat of black paint will improve it

The electrolytic cell consists of a lead tank nearly filled with a suitable liquid in which are immersed two rods of aluminium supported by a light wood frame as shown in Fig 2

The tank should be made of sheet lead not less than 1/32 inch in thickness A good size is 4 inches wide 9 inches long and 8 inches deep Fig 2 indicates how a piece of the sheet lead 14 by 20 inches may be used most economically Cut out the two pieces as shown fold on the dotted lines so that the joints lap on the outside and solder the seams heavily with ordinary solder Do not try to use a lead-lined wooden tank as the success of the apparatus depends largely on the cooling effect of the surfaces exposed to the air

For the electrodes two round aluminium rods [illegible] inch diameter and 6½ inches long are required These must be of commercially pure aluminium and not the so-called "hard stock" or alloy Fasten to one end of each rod a piece of No 16 copper wire to serve as a terminal The best way to do this is to drill a small hole through each rod near one end and then insert the wire and drive down the aluminium with a center punch until the wire is tightly pinched (See Fig 2A) The tank itself also serves as an electrode so that it is necessary to solder a wire to it somewhere on the outside The aluminium rods are best supported in the tank by means of a light wooden frame made of six pieces as shown at B into which the rods may be clamped by thin wooden wedges driven in where they pass through the holes

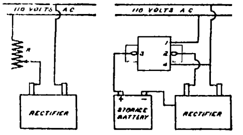

Fig 3 —METHOD OF CONNECTING UP THE RECTIFIER

To make up the liquid for the cell, put two pounds of crystallized sodium phosphate in the tank and fill up the latter with about one gallon of lukewarm (not hot) water or enough to fill it to an inch from the top Stir with a stick until the salt is dissolved and then adjust the aluminium rods so that they dip into the solution three inches.

Before the apparatus can be set at work the rods must be coated with a film of oxide This has to be formed by the alternating current itself, for which purpose the rods may be temporarily connected to the 110-volt power mains as shown, [illegible] in Fig. 3 A resistance, R, of about [illegible] used to prevent too much current from [illegible] first. After half a minute this resistance [illegible] gradually reduced to zero, and the operation [illegible] completed.

For actual service the autotransformer, rectifying cell and storage battery are to be connected up as shown in the second diagram in Fig. 3. The autotransformer may be connected to a 110-volt lamp socket by means of a sufficient length of No. 18 lamp cord and an attachment plug A two-ampere fuse should be included in the circuit.

The windings of the autotransformer have been so proportioned that when connected to 110 volts about 2½ amperes will flow through a six volt, sixty-ampere-hour battery This low rate of charging contributes to long life of the battery and at the same time minimizes the amount of attention necessary in charging, since an overcharge at low rate does very little harm. With ordinary use of an automobile, a ten-hour charge over night every two weeks will keep the battery full and in good order

After about fifty or sixty hours' use of the rectifier the sodium phosphate solution will become exhausted. This will be indicated first by unusual heating of the tank and autotransformer due to leakage currents and finally by the blowing of the main fuse and possibly the discharge of the battery back through the tank and coil It is therefore necessary to make up a fresh solution for the tank and reoxidize the rods after about fifty hours' use or when excessive heating is first noticed

The aluminium rods last a long time, and when the lower ends become worn thin they may be inverted if care be taken to remove every particle of the copper connecting wires.

The apparatus will charge an eight-volt battery, if necessary but at a slower rate and it can also be used on a four-volt battery in an emergency In the latter case the large currents may soon cause overheating unless a resistance of about one ohm be connected in series with the battery

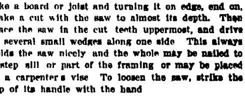
SAW FILING CLAMP

BY C A PITKIN

The saw clamp described by Mr Bayley in the SCIENTIFIC AMERICAN of May 15th is of service in the workshop and I should like to submit a modification of it as used by carpenters and others when the facilities at hand are limited



HANDY SAW-FILING CLAMP

Oftentimes when one wishes to file a saw, while away from the shop and having no filing clamp at hand he is at a loss to know how to firmly hold the tool during the operation A handy expedient is to take a board or joist and turning it on edge, end on, make a cut with the saw to almost its depth. Then place the saw in the cut teeth uppermost, and drive in several small wedges along one side This always holds the saw nicely and the whole may be nailed to a step sill or part of the framing or may be placed in a carpenter s vise To loosen the saw, strike the top of its handle with the hand

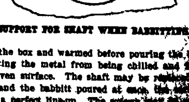
TO SUPPORT SHAFT WHEN BABBITTING.

BY J EDWIN KERR.

This is a suggestion for the simplification of the babbitting of crankshaft boxes, which has been used a number of times with entire satisfaction. Drill two holes about ⅛ inch from the outside end of the box and in about the position shown in cut. Tap the holes for small screws. Let the shaft rest on the head of these screws, which may be adjusted until the shaft is lined up. After lining the shaft it may be taken out of the box and warmed before pouring the [illegible] preventing the metal from being chilled and [illegible] an uneven surface. The shaft may be [illegible] warm and the babbitt poured at once, the [illegible] suring a perfect line-up. The screws [illegible] with a screwdriver when the [illegible] or they may be left in it [illegible]



SUPPORT FOR SHAFT WHEN BABBITTING.

RECENTLY PATENTED INVENTIONS.

Of Interest to Farmers.

MILKING-MACHINE.—L. L. STORY, East Fairfield, Vt. The object here is to produce a machine which can be readily adjusted in position. While the invention concerns itself with the general construction of the machine, it relates also to the construction of the teat cups and the manner of actuating them in the milking operation.

ATTACHMENT FOR CORN-CULTIVATORS.—H. J. NASH, Stanford, Ill. In the present patent the invention is an improved cultivating implement designed and adapted to be used as an adjunct or attachment of a cultivator having plows or shovels for use in furrowing between rows of young corn stalks growing in hills or drills.

Household Utilities.

PORTABLE GRATE.—W. H. HOLLAND, Savannah, Ga. The invention is an improvement in fire-place grates, and has in view a grate of the conventional or other design hinged at one side to swing within and to the outside of the fire-place opening, in which latter position it is adapted to be lifted from its hinges and removed for emptying or other purposes.

BROOM HANGER.—J. H. ASHMEAD, Silver Bay, N. Y. An object here is to provide a hanger by means of which a broom can be hung in an inoperative position from a nail or other support, which serves as an additional means for holding the broom straws securely together on the neck of the broom, and is so constructed that the nail cannot become caught in the broom straws to loosen or otherwise injure the same.

ROCKER FOR CHAIRS.—G. M. STRATTON, Carthage, S. D. The purpose of the invention is to provide hollow rockers of sheet metal for chairs, which are light, strong, shapely, and can be produced at low cost. It consists in a novel construction of rockers and their combination with the legs of a chair.

Machines and Mechanical Devices.

SHUTTLE MECHANISM.—J. LARSEN, Silkegade 13, Copenhagen, Denmark. The present invention concerns a horizontal shuttle which is so arranged that it seizes the thread and holds it fast so that the needle can without stopping go straight down and then again at once straight up, the upper edge of the ring-formed shuttlebed being provided with a horn that holds onto the thread during the formation of the stitch.

APPARATUS FOR MANUFACTURING CIGARETTES.—O. WARTMANN, 681 High Road, Tottenham, London, England. The chief object of the invention is to enable the production of cigarettes which, while formed to a large extent by means of automatically acting mechanism, shall be free from the defects of ordinary machine-made cigarettes and shall exhibit some of the best characteristics of those made entirely by hand.

BUTTER-SERVER.—O. W. MONROE, Seattle, Wash. The construction enables the empty butter dishes to be stacked in a column and removed one at a time, filled with butter, and ejected from the machine. It stops the action and locks movable parts in case of breakage of the wire used for cutting the butter, prevents the stock of butter from moving in the machine except for the purpose of filling a butter dish, provides for effecting the disengagement of butter dishes from the bottom of the column of such dishes, and provides refrigeration and storage of the stock to be used so as to maintain the butter in suitable form to be acted upon by the machine.

DUMPING-SCOW.—F. P. EASTMAN, New York, N. Y. The scow has movable sides normally securely locked against opening, and which can be readily opened without presenting obstructions to the load, thus insuring a complete and quick discharge of the load, especially when the latter consists of bulky and moist refuse liable to cling to any obstructions in its path. The invention relates to scows described in the Letters Patent of the U. S. formerly granted to Mr. Eastman.

CENTRIFUGAL SEPARATOR.—J. A. B. DOMINGUEZ, Guayama, Porto Rico. The invention admits of general use, but is more particularly applicable to the separation of sugar and molasses from the crude product known as massecuite, or in other words, from the material received from the evaporators. Centrifugal force is developed in a rapidly rotating body, and causing such body to exert increased pressure if its direction of motion is suddenly reversed.

Prime Movers and Their Accessories.

ROTARY ENGINE.—F. P. NICHOLS, Houston, Texas. In this patent the invention makes an improvement in rotary engines. In operation the motive fluid being admitted through a hollow shaft, passing upwardly through radial ports and through ports to pressure chambers, acting against the sides of the piston blades to rotate the motor, which comprises the shaft, the casing, and the piston blades.

LUBRICATOR-PUMP.—O. J. AUGUSTA and [illegible], Rock Rapids, Iowa. The invention relates particularly to such pumps as are [illegible] in conjunction with a kinematic element of the engine. Continuity in the oil feed to the pump, the preheating of the oil to be delivered to the pump, and expedients in the regulation of oil delivery, are assured.

Railways and Their Accessories.

KNUCKLE-JOINT CONNECTION.—M. KELLY, Bloomington, Ill. The invention refers to pivotal connection between the connecting rod and the parallel rod of a locomotive, and the aim is to provide a knuckle-joint connection arranged to hold the pivot pin tight and to properly press the jaws to prevent lost motion and uneven wear.

RAILWAY TRACK CONSTRUCTION.—J. H. F. SCHULZE, New York, N. Y. In this patent the invention is an improved construction of railway tracks, and has for its purpose the provision for the easy removal and replacement of the head of the rail, which is the only part worn, without interfering with the rail connection with the road bed.

RAILWAY SWITCH.—T. McGRATH, Denver, Colo. The present embodiment of this invention comprises a plurality of switch-throwing devices arranged on each side of the switch, a locking device for locking the devices in thrown position and for insuring its complete throw, and a hand-operating device which normally is disengaged from the switch.

CAR-COUPLING.—H. C. CANNON, Memphis, Tenn. This coupling is of the Janney type. In operation, when the parts are coupled, the operating bar will be in its outermost position and its serrations will be detached or out of interlocked engagement with serrations of the tongue. If the bar be now moved inward it will first lift the locking dog to uncoupled position and then will move into interlocked engagement with the tongue of the coupling hook and will throw the hook to open position.

Pertaining to Recreation.

BILLIARD-CUE.—I. KALMANOVITZ, New York, N. Y. The improvement pertains to cues, and more particularly cues having removable tips, means for securely and removably mounting the tips in position, and if so desired, between the tips and cue, a body of resilient material which increases the effect of the blow when the cue strikes the ball.

Designs.

DESIGN FOR A SPOON, FORK, OR SIMILAR ARTICLE.—H. I. ROGERS, Albion, Ind. The ornamental design presented is an interesting administration design including the representation of an opossum at one end of the handle, a boll of cotton on the other end, and a sweet potato intermediate its ends.

NOTE.—Copies of any of these patents will be furnished by Munn & Co. for ten cents each. Please state the name of the patentee, title of the invention, and date of this paper.

Legal Notices

PATENTS

INVENTORS are invited to communicate with Munn & Co., 361 Broadway, New York, or 625 F Street, Washington, D. C., in regard to securing valid patent protection for their inventions. Trade-Marks and Copyrights registered. Design Patents and Foreign Patents secured.

A Free Opinion as to the probable patentability of an invention will be readily given to any inventor furnishing us with a model or sketch and a brief description of the device in question. All communications are strictly confidential. Our Hand-Book on Patents will be sent free on request.

Ours is the Oldest agency for securing patents; it was established over sixty years ago.

MUNN & CO., 361 Broadway, New York
Branch Office, 625 F St., Washington, D. C.

INDEX OF INVENTIONS

For which Letters Patent of the United States were Issued for the Week Ending July 27, 1909,

AND EACH BEARING THAT DATE

[See note at end of list about copies of these patents.]

Adding machine, W J Kilpatrick	928,991
Adding machine carriage mechanism, J G Vincent	929,058
Aeroplane, O Heeren	929,217
Agricultural implements, draft appliance for, A Hartman	929,124
Agricultural shovel, J N Larker	929,470
Air apparatus for regenerating vitiated, G F Jaubert	928,978
Air cooling apparatus, J E Glockler	928,950
Air coupling, automatic, A E Squyars	929,511
Air separator, G S Emerick	928,953
Air ship, C J Berthel	929,378
Air ships, paddle wheel particularly for use on, E Frame	929,296
Albuminate preparation, soluble iron, E Lewis	929,483
Aluminous materials, treating, A C Higgins	[illegible]
[illegible], treating, F J Tone	[illegible]
Aluminum silicate ores, treating, F J Tone	929,518
Amalgamator, E Hackett	929,093
Amusement apparatus, T Hellesen	929,130
Animal trap, O Lund	929,147
Animal trap, S Rich	929,40[illegible]
Arm rest and window guard, combined, J Haberlin	929,419
Asymmetric cell, W C Arsem	929,171
Automobile buffer, A L McGregor	929,149
Automobile propelled vessel, J W Freeman	928,965
Automobile safety steering attachment, H P Larouette	929,005
Axle box and washer, M F Beddy	929,189
Axle lubricator and dust excluder, H J Hansen	[illegible]
Bag. See Fruit picker's bag	
Bag frame, Hierling & Fuller	928,971
Baggage carrier, J F Heckert	929,098
Ball for use in athletics, R Reach	929,013
Banjo, D L Day	928,948
Barge, H W Kirchner	929,159
Barrel scrubber roller, A Birnbaum	929,170
Battery contact, J H Gugler	929,062
Battery grids, tool or machine for making storage, R N Chamberlain	[illegible]
Battery supporting mechanism, T A Buckwalter	929,118
Bearing, adjustable flexible, Gaillard & Bailey	929,481
Bearing, antifriction, H Frahm	[illegible]
Bearing, antifriction, F Heuermann	929,127
Bearing, ball, J H Heckmann	929,420
Bed, folding, E J Crouch	929,580
Bed, wall, W C James	929,46[illegible]
Belt and [illegible] suspending attachment, M I [illegible]	[illegible]
Belt fastener, metallic, C F Cox	929,078
Berry box, J Heublein	929,010
Bicycle motor attachment, G Belz	929,0[illegible]8
Billets and the other [illegible] machine for [illegible] the walls of tubular, L D Davis	929,040
Binder for loose leaf books, C H Chapman	929,08[illegible]
Binder, loose leaf, S H Mitchell	929,003
Binder, loose leaf, C M Orr	[illegible]
Binder stick and [illegible], T A Butler	[illegible]
Biscuit cutter, C H Hawbolt	[illegible]
Bit extension, T A Leland	929,231
Blast furnace charging apparatus, J C Roberts	929,031
Blind or screen fastening, storm, C Singer	929,507
Blind slat adjuster, F W F Hermann	929,128
Block signal system, L A Hawkins	929,401
Boats, exhaust for motor, J W Walters	929,05[illegible]
Boiler alarm, F Larleh	929,478
Boiler flue cleaner, Beland & Dean	929,377
Boiler flue cleaner, F R Ratcliffe	929,480
Boiler low water alarm, steam, C Brent	[illegible]
Bolster, separable cast, J M Ames	[illegible]
Bolt and nut lock, D C Inman	[illegible]
Bookbinder, A Spahn	[illegible]
Bottle, nonrefillable, A A Westerlund	[illegible]
Bottle machine for applying caps to, F Reich	929,18[illegible]
Bottles or jars, dipping device for, B W McGinnis	929,40[illegible]
Box, F J Metz	[illegible]
Box, W I Howland	929,118
Brakes, accelerator for continuous pneumatic, Chapsal & Saillot	[illegible]
Brush head, Wilkes & Lyke	929,064
Brush, shaving, D S King	929,10[illegible]
Bucket jack, C W Ehlers	[illegible]
Buckle, C H Davenport	928,944
Buggy top support, J C Martin	929,135
Burner, A C Calkins 929,070	929,07[illegible]
Burner for blast furnaces, W H Schultz	[illegible]
Bust supporter, A Drake	929,107
Cabinet, filing, J Dunnecker	[illegible]

Classified Advertisements

Advertising in this column is 75 cents a line. No less than four nor more than ten lines accepted. Count seven words to the line. All orders must be accompanied by a remittance. Further information sent on request.

READ THIS COLUMN CAREFULLY.—You will find inquiries for certain classes of articles numbered in consecutive order. If you manufacture these goods write us at once and we will send you the name and address of the party desiring the information. There is no charge for this service. In every case it is necessary to give the number of the inquiry. Where manufacturers do not respond promptly the inquiry may be repeated.

MUNN & CO.

BUSINESS OPPORTUNITIES

MANUFACTURERS AND CAPITALISTS you can secure an interest in a new invention or manufacture it on royalty. For further particulars address M R. Schultz, Southampton N Y.

Inquiry No 8968. Wanted to buy nickeloid for buttons.

AN ESTABLISHED BUSINESS with tools, patents and copyrights, for a necessary sheet metal engine room specialty. Splendid opportunity for young man with moderate capital, or for manufacturer to add a profitable line. Opportunity, Box 773 New York.

Inquiry No 8918. For manufacturers of Wyeth's Electrolytic Sparking Plug.

MANUFACTURING CONCERN with ample capital and fine general machine equipment is desirous of securing an article to manufacture and place upon the market. A novelty or labor saver not a toy. Address Attracta, Box 773 New York.

Inquiry No 8923.—Wanted the address of Worthington Boiler Co.

PATENTS FOR SALE

FOR SALE. Outright or on royalty. U S Patent No 916,877 covering an automatic marine engine governor which device will control the speed of marine engines in stormy weather at sea, thereby preventing breakdowns of the engines as is frequently caused by abnormal speed of the engines. U S Patent No [illegible] and Canadian Patent No. 116,681 both patents covering an improvement in hydraulic air compressor. The principal points of advantage of my compressor over other hydraulic air compressors consist of a novel and simple valve system which overcomes all defects and troubles of the valve system as used in all other hydraulic compressors to-day, making therefore my compressor most useful for beer dispensing purposes. Will stand a thorough investigation and can be manufactured at low cost. Inventor has no funds to promote these inventions and will therefore consider all reasonable offers. For further information address Louis E. L. Thomke, Inventor 234 Garry St, Winnipeg Man Canada.

Inquiry No 8921. For the manufacturers of gilt paper.

FOR SALE. Very valuable patent in connection with automobiles. Article used by every manufacturer. Demand rapidly increasing. Orders for over 100,000 on hand. Complete plant. Reasons for selling. Address Valuable, Box 774, New York.

Inquiry No 8931. For parties who manufacture the Western Stump borer for boring stumps.

FOR SALE. A most valuable patent. Combination trunk and typewriter desk. Don't miss opportunity. For full particulars and further information address M R Schultz, Southampton N Y.

Inquiry No 8941. For manufacturer of machinery for making fly screens.

FOR SALE. Patent No 909,174. Improved combination lock for doors. One of the best articles for the market. Cheap to manufacture. Large profit. Apply to inventor C H Cohn 92 E 114th St New York.

Inquiry No 8960. For the address of the Windsor Mfg Co manufacturers of waterproof collars and cuffs.

FOR SALE. Patent No 923,472. Friction transmission gear designed for automobiles which have no end thrusts or side twist on bearings. Need money for other patents. Will sell outright. For particulars address C C Williamson 490 31st St Oakland Cal.

Inquiry No 8966. Wanted the address of the Cohendet Motor Co.

FOR SALE. Patent No 917,282. Grain shocker attachment to a harvester. Sets up a perfect shock. For full particulars and further information address R W Fritz, Denton Texas.

Inquiry No. 8969. Wanted machines that make accordion dress plaiting (steam).

FOR SALE. Dynamometer patent. A power meter which weighs and leaves a written record of power used. Address Cornelius I. Winkler, Attorney at Law, 45 Broadway New York City.

Inquiry No. 8971. For address of firms interested in fishing reels.

FOR SALE. U S Patent No. 84[illegible],018, power shovel $2,000. U S Patent No. 917,625, safety appliance for railway cars $1,000 cash. For further information write Robert Belden, Tulga, Butte Co Cal.

Inquiry No 8977. For manufacturers of machinery for manufacturing denatured alcohol.

HELP WANTED

YOUNG MAN graduate of some school in mechanical engineering for position in woodworking plant in small Tennessee town. Good opportunity for advancement. State experience if any and salary. Answer Position, Box 77 New York.

Inquiry No 8978.—Wanted the address of manufacturers of dry pans or crushers to grind sand for plastering and cement works.

LISTS OF MANUFACTURERS

COMPLETE LISTS of manufacturers in all lines supplied at short notice at moderate rates. Small and special lists compiled to order at various prices. Estimates should be obtained in advance. Address Munn & Co. List Department, Box 773, New York.

Inquiry No 8980. For the address of manufacturers of mortars and pestles that are used by druggists.

A LIST OF 1,500 mining and consulting engineers on cards. A very valuable list for circularizing, etc. Price $1 50. Address Munn & Co., List Department, Box 773, New York.

Inquiry No 8981. Wanted the address of the manufacturers of Cypress wash tubs.

Inquiry No. 8982. Wanted the manufacturers of the Van Winkle Woods & Sons and the Weber power meters.

Inquiry No. 8990. For information regarding shoes not made of leather but similar to the same and are as durable.

Inquiry No. 8996. Wanted addresses of manufacturers of machinery for working orange wood manicure sticks.

Inquiry No. 8997. Wanted the address of the manufacturers of bread or cake boxes.

Inquiry No. 9001.—For the address of progressive manufacturers of fruit jars.

Inquiry No. 9004. Wanted to buy machinery suitable for grinding, sifting and preparing cooked cereals also packing same in cartons.

Inquiry No. 9007. Wanted a tin churn for churning milk that has a wire spring at top and bottom of churn and operated by pressing the wire springs.

Inquiry No. 9009.—Wanted the address of the manufacturer of the "Leech" showcard holder, a device which is held to the outside of a show window by rubber cups.

Inquiry No. 9010.—Wanted to buy a "Rector Help-a-Phone."

Inquiry No. 9011. For the manufacturers of a patent sewing needle that is made to slip over the thread; the eye is split so as to open and receive the thread.

Inquiry No. 9012.—Wanted to buy papier mache boxes in the shape of water melons colored to resemble melons, etc.

Inquiry No. 9013. For the address of the manufacturers of double edge safety razor blades.

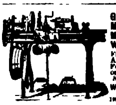
How to Construct An Independent Interrupter

In SCIENTIFIC AMERICAN SUPPLEMENT 1615, A Frederick Collins describes fully and clearly with the help of good drawings how an independent multiple interrupter may be constructed for a large induction coil.

This article should be read in connection with Mr Collins' article in SCIENTIFIC AMERICAN SUPPLEMENT 1605, "How to Construct a 100-Mile Wireless Telegraph Outfit."

Each Supplement costs 10 cents; 20 cents for the two. Order from your newsdealer or from

MUNN & CO, 361 Broadway, New York



FOR GUNSMITHS, TOOL MAKERS, EXPERIMENTAL & REPAIR WORK, ETC

From 9-in to 13-in swing. Arranged for Steam or Foot Power, Velocipede or Stand up Treadle. *Send for Lathe Catalog.*

Concrete
Reinforced Concrete
—AND—
Concrete Building Blocks

Scientific American Supplement 1543 contains an article on Concrete by Brysson Cunningham. The article clearly describes the proper composition and mixture of concrete and gives results of elaborate tests.

Scientific American Supplement 1538 gives the proportion of gravel and sand to be used in concrete.

Scientific American Supplements 1567, 1568, 1569, 1570 and 1571 contain an elaborate discussion by Lieut. Henry J. Jones of the various systems of reinforcing concrete, concrete construction and their applications. These articles constitute a splendid text book on the subject of reinforced concrete. Nothing better has been published.

Scientific American Supplement 997 contains an article by Spencer Newberry in which practical notes on the proper preparation of concrete are given.

Scientific American Supplements 1568 and 1569 present a helpful account of the making of concrete blocks by Spencer Newberry.

Scientific American Supplement 1534 gives a critical review of the engineering value of reinforced concrete.

Scientific American Supplements 1547 and 1548 give a resume in which the various systems of reinforced concrete construction are discussed and illustrated.

Scientific American Supplement 1564 contains an article by Lewis A. Hicks, in which the merits and defects of reinforced concrete are analyzed.

Scientific American Supplement 1551 contains the principles of reinforced concrete with some practical illustrations by Walter Loring Webb.

Scientific American Supplement 1573 contains an article by Louis H. Gibson on the principles of success in concrete block manufacture, illustrated.

Scientific American Supplement 1574 discusses steel for reinforced concrete.

Scientific American Supplements 1575, 1576, and 1577 contain a paper by Philip L. Wormley, Jr. on cement mortar and concrete, their preparation and use for farm purposes. The paper exhaustively discusses the making of mortar and concrete, depositing of concrete, facing concrete, wood forms, concrete sidewalks, details of construction of reinforced concrete posts.

Each number of the Supplement costs 10 cents.

A set of papers containing all the articles above mentioned will be mailed for $1.80.

$15.00 TO $35.00 A DAY

This is what you can make by operating our 1909 Model Wonderful Ferrotype Machine which takes three different styles of pictures on plates 1⅝x2½ inches, and is reversible to take groups and button pictures. It is the best money maker on the market. Is used on Street Fairs, Carnivals, etc. Our 1909 Model Tale Camera Scope the latest button machine in the market, makes and delivers six pictures in one minute. Price $15.00. Plates for any button machine [illegible] per hundred. Button Frames 1/4c to $1.50 per gross. Plates, 1⅝x2½, $1 per hundred. Mounts 25c to 50c per hundred. $5 required with order balance C. O. D. Write today for free catalog. New York Ferrotype Co., 142-144 Delancey St., Dept. 8, New York.

WELL DRILLING MACHINES

Over 70 sizes and styles for drilling either deep or shallow wells in any kind of soil or rock. Mounted on wheels or on sills. With engines or horse powers. Strong, simple and durable. Any mechanic can operate them easily. Send for catalog.

WILLIAMS BROS., Ithaca, N. Y.

Schools and Colleges

Mackay School of Mines
University of Nevada

Best equipped mining school in the country—all buildings of special construction. Faculty composed of prominent engineers and every department in charge of experienced instructors. Located close to great mining districts—students obtain both wages and practical experience during vacations. Splendid climate—every opportunity for outdoor life amid beautiful surroundings. Regular term opens August 23rd. For detailed information address

JOSEPH E. STUBBS, President. Reno, Nevada.

Bliss Electrical School

20 Takoma Ave., Washington, D. C.

Offers a theoretical and practical course in ELECTRICITY complete in one year. Students actually construct Dynamos, Motors, etc., and are trained for good positions in electrical industries. 17th year opens September 22. Send for Catalog.

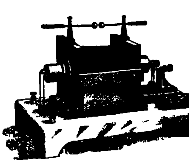
NOW READY

The Design and Construction of Induction Coils

By A. FREDERICK COLLINS

8vo. 295 Pages and 160 Illustrations, made from original drawings made especially for this book

PRICE $3.00



Reduced Fac-simile Intermediate Sized Induction Coils.
Completed, 4, 6, or 8 inch Coil.

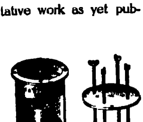
THIS work gives in minute details full practical directions for making eight different sizes of coils, varying from a small one giving a ½-inch spark to a large one giving 12 inch sparks. The dimensions of each and every part down to the smallest screw are given and the descriptions are written in language easily comprehended.

Much of the matter in this book has never before been published as, for instance the vacuum drying and impregnating processes, the making of adjustable mica condensers, the construction of interlocking, reversing switches, the set of complete wiring diagrams, the cost and purchase of materials, etc. It also contains a large number of valuable tables, many of which have never before been published.

It is the most complete and authoritative work as yet published on this subject.

Following is a list of the chapters

- I. The Development of the Induction Coil.
- II. Theory of the Induction Coil Simply Explained.
- III. Some Preliminary Considerations.
- IV. Forming the Soft Iron Core.
- V. Winding the Primary Coil.
- VI. The Insulation Between the Primary and Secondary Coils.
- VII. Winding the Secondary Coil.
- VIII. Winding the Secondary Coil (continued)
- IX. Vacuum Drying and Impregnating Apparatus.
- X. Constructing the Interruptor
- XI. Building up the Condenser
- XII. Adjustable Mica Condensers.
- XIII. Reversing Switches and Commutators.
- XIV. Spark-Gap Terminals and Other Fittings.
- XV. The Base and Other Woodwork.
- XVI. Wiring Diagrams for Induction Coils.
- XVII. Assembling the Coil.
- XVIII. Sources of Electromotive Force.
- XIX. The Cost and Purchase of Materials.
- XX. Useful Tables, Formulas, Symbols, and Data.



Reduced Fac-simile,
Simple Impregnating Chamber.

Triple Action SAFETY POLICE Revolver

Is Safe because its Safety is In-built

When you own a Triple Action Safety Police you have a positively accident-proof revolver You can see the perfect safety, you can feel it the minute you get this weapon in your hands. You can't help but know it's safe because the evidence is right before your eyes. The triple action is the safety action and it's built right into the mechanism of the gun.

That's why the Triple Action Safety Police is safe, not once or first but last and always. It can't go off until you deliberately pull the trigger

The Triple Action just means Triple Safety The instant you pull the trigger of this weapon the hammer cocks, then lets drive at the firing pin straight and hard the second it hits the firing pin, the instant the shot is fired the third movement then lifts the hammer up and above the firing pin away above it, out of all possible contact with the firing pin There it lodges securely safely firm fixed and immovable against a wall of solid steel The weapon will not cannot fire again unless you actually pull the trigger all the way back

32 and 38 calibre, 4 inch barrel, nickeled finish, $8 50- blued finish, $10 00 For sale at all good hardware and sporting goods stores, but if your dealer does not have it, we will send one to you post paid on receipt of price Send for our 1909 Gun Guide and Catalog which illustrates, describes and prices the most extensive line of firearms made

RACING YACHTS IN A GALE

The recent run of seventy vessels of the New York Yacht Club from Martha's Vineyard around Cape Cod to Portland harbor afforded a supreme test of the seagoing qualities of the modern racing yacht The distance was 152 miles Not long after the start the wind began to freshen and throughout the night as the yachts fought their way along the coast of Cape Cod it increased to what was probably a moderate gale The fleet was so roughly handled that the majority of the boats were scattered during the afternoon and night and the following morning found refuge in the various harbors from Vineyard Haven to Portland Of those that completed the run or rather race, for such it was F F Brewster's 90-foot schooner 'Elmina went through without any mishap covering the 152 miles in 22 hours 36 minutes and 38 seconds elapsed time Equally meritorious was the performance of Cornelius Vanderbilt's sloop Aurora, a vessel over 30 feet shorter than Elmina' on the waterline which covered the course in 26 hours 11 minutes and 21 seconds beating Mr W E Iselin's 90-foot yawl 'Vigilant the old America cup defender, by over 9 hours. The Aurora was navigated throughout by Mr W Butler Duncan Jr who says that the one-design Herreshoff yachts (the class consists of the "Aurora Istalena and Winsome) could hardly be surpassed in their weatherly qualities and were not in the least danger in the seaway Nevertheless, the fact remains that a moderate summer gale sufficed to scatter this fleet of seventy vessels completely disabling many of them and driving the greater part of them to the shelter of the nearest harbor The casualties comprised almost every kind of a disaster that can befall sails and spars, running and standing gear from complete wreckage as in the case of the Eleanora, formerly the Effort whose mast went by the board, carrying bowsprit and everything above deck with it to the breaking of the jaws of the gaff and the parting of blocks and the minor mishaps so well known to the racing yachtsman The many casualties merely emphasize the fact already well known to experienced yachtsmen and designers that the enormous spars and big sail plan of the modern racing yacht are ill adapted for a thrash to windward in a heavy sea and wind Although when a racing yacht is staggering along under her full press of canvas the strains in spars shrouds and stays run up to a very high figure they evidently do not equal the more violent strains which occur under the sudden snappy plunging and lurching of a vessel that is being driven under reduced canvas in a short and lively sea. The result of this experience of a summer's gale will be to bring the moderately sparred and more comfortable cruiser into greater favor with the average yachtsman

PEARY AND THE NORTH POLE

Public interest in the present attempt by Peary to reach the North Pole has been reawakened by the recent start of the schooner Jeanie' from St John's, Newfoundland for Etah west Greenland, for the purpose of getting into communication with the explorer, who has now been absent over twelve months on his present expedition to the North Pole When Peary left in the Roosevelt,' about twelve months ago, he planned to push as far north as the ice would admit and then establish winter quarters and make preparation for a dash by sled between March and June of the present year If he were successful he planned to return to Etah with the ship if possible and if not, without it If he failed to reach the Pole, it was his purpose should another attempt seem to promise success to remain in the North till the summer of 1910 and make another attempt in the early months of that year If any disaster has befallen the Roosevelt," the schooner will probably find Peary at Etah awaiting her arrival, and he will be there if he has succeeded in reaching and returning from the Pole. Should he have failed in his quest, he will still be far away to the north, and the schooner will bring back such dispatches and reports as he may have sent down. Possibly the vessel will also bring back Dr F A. Cooke, of Brooklyn, who went north two years ago and was landed at Etah to undertake a trip to the Pole with a single companion The last word from him was sent back by a native when he was about to go out over the Arctic ice on his quest If all goes well the return of the vessel may be looked for about October 1st, when some definite news of Peary's work may be expected

TWENTY MILES UNDER THE SEA

The rapid progress of the arts and sciences in these opening years of the twentieth century affords opportunity for the enjoyment of novel situations and sensations which were possible only in the dreams of the enthusiast of an earlier day Thanks to official courtesy the Editor was recently afforded an opportunity, during the trials of the latest submarines built for our navy to make a run of some twenty miles below the surface of the water in one of these always interesting and to-day extremely formidable craft.

A little removed from the long lines of battleships, destroyers, and auxiliaries, that were moored during the recent summer maneuvers in Provincetown Bay, was the converted hull of an old wooden sailing brig, the property of the Fore River Ship Building Company which acted as "mother ship' to a group of submarines, recently constructed by that company which had been brought to Provincetown for their official government tests Selecting the Stingray ' one of the largest submarines, for the reason that her trials for the day were to be carried on entirely below the surface, we went aboard, and found ourselves on a narrow flat deck, about five feet in width and sixty feet in length which covers in the superstructure a light construction of steel plating built upon the hull of the submarine proper, and perforated so as to allow a free entrance and exit of the water A steel hand rope, carried in removable stanchions surrounds this deck Extending up through the center of the deck to a height of about five feet is a narrow elliptical tower, on top of which is the sighting hood or conning-tower, pierced by several little glass-filled ports for observation Just in front of the conning tower is a removable navigating bridge used when the ship is at the surface. In front of this are the two tall tubes of the periscopes, which are in duplicate

The ship was driven to the outside mile course by the electric motors, the gasoline engines which are used for propulsion on the surface in extended runs being uncoupled The first surprise of the day was the extraordinary smoothness of the motion, there being not the slightest vibration to indicate that the vessel was under way As we approached the course orders were given to dismantle the upper works and send everything below The wire handrope around the deck was removed the stanchions lifted from their sockets the navigating bridge on the conning tower was knocked down, and all of this material, with the steering gear, compass, etc, was handed piece by piece, through the manhole, until the ship was stripped clean for the dive As soon as everybody had gone below the manhole was closed and the submarine was ready for her first run over the measured mile course Below decks throughout the five hours below the surface we were struck with the purity and sweetness of the air and the absence of any odor other than that of the last coat of paint which the interior had received Forward side by side we noticed the two torpedo tubes. Aft, beyond a bulkhead, were the twin gasoline engines, and abaft of them the two motors, the former used for charging the batteries and for propulsion when the ship is at the surface, the latter being used exclusively for propulsion when the ship is submerged

While making the trial runs, the steering is done by a man in the conning tower Immediately below him standing on the deck is the lookout, with his eye at the periscope Facing the side of the vessel, another man controls by means of a handwheel, the diving rudder and holds the vessel at its proper depth. At various stations were men with their hands upon the wheels and levers that regulate the ballast tanks for giving the proper submergence and trim to the vessel aft were the engineers.

It will be remembered that when we went below, the submarine was floating at the depth for surface cruising The first operation was to admit sufficient water into her tanks to sink the boat to the awash condition and in sharp succession the commands came, 'Fill the main ballast tank," "Fill the forward trimming tank," " Fill the after trimming tank" Immediately one could hear the rather ominous swish of the water as it rushed into the vessel Instinctively our eye followed the pointer on the large depth gage, which was fastened on the side of the submarine in front of the man who controls the diving rudder The tanks were left open till a depth of five feet was registered Then came the order to start the engines which was shortly followed by the sharp word of command, "Dive." A few swift turns to the handwheel were followed by a curious dipping or lurching sensation, as the submarine, impelled by the downwardly-deflected rudder astern, changed from the horizontal to an inclination of about five degrees, and began to go down The descent was shown at once on the depth gage, which moved quickly to indicate eight, ten, twelve, and ultimately fifteen feet, the depth at which the runs were to be made.

It should be explained here that the handling of the diving rudder is the most delicate operation, and the one requiring most skill and judgment, connected with the submarine The rudder must not be put down too suddenly, or there may be too precipitate a plunge. At 9 5 knots, the speed at which the run was made, it took about five degrees of rudder to make the dive. The submarine going down had an inclination of three and a half degrees. To keep her on an even keel when submerged, it was necessary to give her about one and a half degrees of the diving helm. This is due to the fact that when the submerging tanks are filled she does not take in sufficient water ballast to entirely sink her but is adjusted with a reserve buoyancy of about 1 000 pounds. To correct this buoyancy, it is necessary to keep the helm slightly down when she is running. To reach the fifteen-foot depth takes from fifty seconds to a minute and a half, according to the speed at which the boat is being run.

The mile course was laid out about half a mile off shore, the start, finish, and quarters being marked by pairs of ranges set up on shore The instant of passing the ranges was noted by the man at the eyepiece of the periscope, which was swung around at right angles to the axis of the boat. As each range passed the field of the periscope, the observer called out 'Mark the time being taken by observers both on shore and within the submarine When the mile course had been covered which was done under full power at the rate of nine and a half knots, the diving rudder was put up and the same curious change of level was felt as when the dive was made.

Perhaps the most surprising thing about this five hours' trip below water was the fact that, even when the boat was being driven at the highest speed there was practically no vibration and absolutely no indication that the water was sweeping by the vessel at a speed of nearly twelve miles an hour The only sound was the slight hum of the electric motors, punctuated by an occasional word of command from navigator or engineer As far as any indication of sight or sound was concerned, the cabin might have been that of any ship that sails the surface of the sea in the orthodox manner The first suggestion that the boat was alive with movement came when, at the end of the run the submarine thrust her nose above the surface, when the swish of the broken water at the bow could be distinctly heard After making a wide turn and heading for the course the rudder was put down, a dive to the fifteen feet depth was made, and under a reduced speed of about eight knots, the course was again covered This was repeated, until the twelve runs scheduled for the day's trial had been completed the speed of the successive runs varying from nine and a half down to a minimum of about four knots. The engines were standardized by counting the revolutions corresponding to the various speeds.

A look through the eyepiece of the periscope, while we were submerged, removed the last doubt as to the ability of the submarine to "see" By means of a handwheel the periscope may be swept rapidly around the whole horizon, and so perfect is the reflection of the little mirrors, that we were able to pick out any particular battleship yacht, or object on shore, with as much ease and as perfect visibility as if we had stood six or eight feet above the water, at the level of the object glass at the top of the periscope. The operator stated that in rough weather the wash of the waves keeps the glass clean and does not interfere with vision.

There can be no question that the submarine has at last 'come into its own" Among the captains of the battleships and the line officers in general at Provincetown, there was noticeable a growing respect for these craft, due to the varied and accurate work which the flotilla had accomplished during the summer maneuvers. There has been a steady but slow growth in the speed of the submarine. Its control is now perfect, and its radius of action is being rapidly increased Our largest boats have a radius of about one thousand miles, and two are under construction on the Pacific coast which will have a cruising radius of about three thousand miles. This means that the submarine is taking on full seagoing qualities. It must no longer be regarded as restricted to seacoast operation. The time is not far distant when an admiral searching for the enemy upon the high seas may include a submarine flotilla in his fleet. The profound significance of this fact upon strategy and tactics will be appreciated by every naval expert.

ENGINEERING.

The New York, New Haven & Hartford Railway Company are about to make tests of the comparative performance of electric and steam locomotives in freight service. To this end they have ordered two freight locomotives. One of these is to be equipped with side rods, and the other will be of the geared type.

Statistics of accidents on the railways of the United Kingdom for the year 1908 show that in accidents to trains, rolling stock, or permanent way no passengers were killed, but 282 were injured while of employees, 6 were killed and 164 injured Accidents of a kind other than the foregoing included 102 passengers and 376 employees killed, and 2 240 passengers and 4 976 employees injured

The "Alagoas," the seventh of ten torpedo-boat destroyers ordered by the Brazilian government was successfully launched by Messrs. Yarrow & Co. of Glasgow on July 29th. Like her sister vessels she is 240 feet long by 23 feet 6 inches beam, and will be equipped with two doubel-ended Yarrow boilers of 4 000 horse-power capacity, supplying the two sets of 4 cylinder triple-expansion engines, refrigerating apparatus and other auxiliaries

In a recent paper W E Gray states that the manufacture of tin plates originated in Bohemia hammered iron plates having been coated with tin in that country some time before the year 1600 Tinplate making was introduced into England from Saxony in 1665 and the first tinplate factory in France was established in 1714 Tin plates were first made on a commercial basis in the United States at Pittsburg in 1872

According to Railways of Calcutta, the success of the monorail system in India for carrying freight and passengers is largely a question of finding a satisfactory type of carriage and Mr Brennan is now making experiments on short lengths of roads in India to determine this question The monorail system is believed to possess great value because of its simplicity and cheapness of construction for military purposes on mountain roads The result of the experimental work will be given in a forthcoming report

The Jamaica Bay Improvement Commission will shortly make a survey for the bulkhead line which will be built at about 2 000 feet from the westerly and northerly shore of the bay and will extend from Barren Island to Three Mile Creek The government will dredge a channel which will ultimately be 30 feet deep and 1 000 feet wide The dredged material will be used to fill in the 1 250 acres between the bulkhead and the shore line. In the earlier stage of the operations it is proposed to dig the channel to a depth of 18 feet and a width of 500 feet.

The work which has been done in the electrification of steam railroads has probably suffered from the lack of collaboration between the different railroads and interests that have been engaged in such work Hence, it is gratifying to note that the New York Railway Club has appointed a special committee to take up the subject during the coming fall and winter and report at the annual electrical meeting of the club in March next They will collect data and make suggestions as to the direction in which further investigation should be made Substantially the same action has been taken by the Maintenance-of Way Association and the American Railway Association.

A new record for mining and shipping anthracite coal has recently been made by the Kingston Coal Company of Wilkes-Barre, Pa During the month of July, that company's breaker No 2 shipped 91 000 gross tons of coal which, as far as we can learn, beats the record of any in the United States. This breaker has been entirely rebuilt during the last six months without any stoppage of its machinery, improved springboard shakers being substituted for revolving screens, and mechanical pickers introduced to dispense with a large number of boys on the picking belts The breaker worked twenty four full working days of nine hours, the greatest number of mine cars dumped in one day being 1,641

So vast are the crowds which are expected to gather during the forthcoming Hudson Fulton Celebration, that the Executive Committee have made elaborate plans for the proper care of the health and convenience of the visitors. During the entire time of the celebration there will be open, twenty-four hours a day, a large number of emergency hospitals, provided with telephone connections A number of physicians and 1,500 trained nurses have volunteered their services. During the three days of the land parades there will be established a temporary emergency hospital at every five blocks, with ambulances stationed at every ten blocks. During the two water events of the celebration, an innovation will be introduced in the form of ambulance launches, with nurses, doctors, and police officers in attendance.

ELECTRICITY.

In recent trials of the Pollak Virag high-speed telegraph between Berlin and Königsberg, a distance of 480 miles, 2,800 distinctly recorded words were transmitted in five minutes

So successful have been the experiments with the new Telefunken system of wireless transmission at the new 20-kilowatt station of the Austrian government at Pola on the Adriatic that signals strong enough to be automatically printed on tape by the coherers were received at Norddeich on the North Sea, Copenhagen, and Berlin

The wave forms of electric currents have been made visible by M Abraham of Paris by means of an adaptation of the mirror galvanometer Upon the mirror being set swinging horizontally by the current the beam of light is thrown upon a revolving prism and a set of fixed mirrors in such a way that it is spread out in the vertical direction so that the wave form of the current appears upon a screen

The French government, which already had the monopoly of telegraph and telephone operations in France, has extended its legislation to include wireless telegraphy No wireless telegraph or telephone apparatus may be set up on French territory or ships except where authorized by the state and foreign vessels in French waters may not operate their apparatus in such a way as to conflict with government messages

Wireless messages transmitted from the Glace Bay station in Canada have recently been picked up with some regularity by the Eiffel Tower receiving station in Paris proving that transatlantic wireless communication is an accomplished fact. The Paris plant is in no way competing with commercial stations being purely for military purposes making no communication with places outside of France except the French African colonies.

The growing importance of the electric vehicle, hitherto somewhat overshadowed by the more showy successes of the gasoline car is evinced by the fact that at the recent annual convention of the Society of Automobile Engineers in Chicago half the papers presented related to electrical subjects Two of the papers referred to storage batteries and one to measurement of energy consumed by commercial vehicles the most animated discussion of the meeting centering around the latter

The notable successes of wireless telegraphy in procuring speedy assistance for ships in distress at sea in spite of fog and distance best exemplified by the cases of the "Republic and the Ivernia ' has caused an application for lower insurance rates for vessels equipped with wireless apparatus to be proposed for the international marine insurance congress at Baden next month Success of the application should be mutually beneficial both effecting a saving in insurance cost to shipowners using wireless and extending the use of the latter

Upon the successful completion of tests now in progress of a 5 000-kilowatt unit the New York Interborough Railway will install two more General Electric Curtis low pressure turbines driving 3 phase 25-cycle 11 000-volt generators each of 5 000 kilowatts capacity operated by exhaust steam from existing reciprocating engines at the 59th Street power house It is estimated that the turbines will take nearly as much power from the exhaust steam as the reciprocating engines do in expanding from 150 pounds pressure to atmosphere

The Great Eastern Railway of England, with one of the largest termini in London and a great suburban traffic has lost passengers at the rate of 25,000 000 per annum since the advent of the London County Council's electric tramways, and this in spite of a gradual reduction of its fares amounting in some cases to 40 per cent. The council tramways are a municipal undertaking, and while giving good service have been run hitherto at a loss, the deficit being paid out of the rates, so that the railway company as a large ratepayer, is naturally aggrieved at having to contribute to the support of a successful rival

The Public Service Commission, which has been considering the question of compulsory electrification of railways passing through the Adirondacks forest preserve, as a means of fire prevention in the latter has rejected this remedy on account of its prohibitive cost. The additional cost of operation by electricity was estimated to be $1,156,470 a year more than the present cost of operation by steam locomotives for the New York Central lines alone, that figure being reduced by only $100,000 if all the power were generated by water This great expense is due to the very unfavorable conditions for electric service the traffic consisting of a few heavy trains over comparatively long distances, whereas economical electrical operation requires a fairly uniform traffic composed of a large number of small trains at small intervals, as in the suburban service of large cities.

SCIENCE.

Capt R F Scott, who recently returned after a thrilling attempt to reach the South Pole in which he was nearly successful has announced his intention of setting out on another Antarctic expedition early in 1910

That the New York Aquarium is certainly meeting with public approval would follow from the remarkable attendance in July 1909 During that month 528,266 persons passed through the turnstile—an average of 17 040 per day Up to August 2d 1909 the total attendance was 2 006 919

It is announced that Lieut Shackleton will lecture in the United States and Canada in order to earn enough money to pay the heavy indebtedness which he incurred on his last Antarctic expedition The announcement is astonishing as it was generally supposed that Lieut Shackleton had been aided by his government It is stated that the expedition was financed by a small group of Americans who lost their all in the last financial crisis

The Duke of the Abruzzi cables that he has ascended Mount Godwin-Austen in the Himalayas to a height of 24 600 feet He failed by 3 665 feet in reaching the mountain's summit We believe that although he did not succeed in his ultimate object in ascending this lofty peak he has broken all records for mountain climbing The Duke had an advantage over the private individuals who were his rivals in the Himalayan field in so far as the government of India furnished him with guides and porters For all that, his hardships must have been tremendous The Workmans have stated that climbing in the Swiss Alps is child's play compared with the feats of endurance which climbing in the Himalayas demands

As aluminium is extensively employed in the manufacture of kitchen utensils it is important to know how it is affected by the foods which are brought into contact with it For this purpose Pillinger boiled aluminium foil in fresh milk sour milk wine mineral waters and 10 per cent solutions of various salts The aluminium foil was weighed before and after the boiling which was continued for half an hour No appreciable loss of weight was produced by boiling in sweet milk white or red wine or solutions of sodium chloride potassium iodide, sodium nitrate potassium sulphate and calcium nitrate and only a very small loss was caused by sour milk The aluminium was strongly attacked however by sodium bicarbonate magnesium sulphate calcium sulphate and mineral waters

Garrigon has tested the radio-activity of the hot springs of the Pyrenees by immersing in their waters a photographic film inclosed in a tube of aluminium The film showed an impression after a longer or shorter immersion while a second film immersed in the same conditions but inclosed in a tube of lead remained unaffected A very thin sheet of lead suffices to stop the radiations of radium etc which pass through comparatively thick sheets of aluminium The following experiment of similar character is reported by an Italian scientific journal A photographic plate wrapped in paraffined paper (to exclude moisture) and then in black paper was placed between two plates of iron 1/12 inch thick which were coated with asphalt varnish The iron plate next to the sensitive film had five perforations about ½ inch in diameter The whole apparatus was suspended for 15 hours over a spring with the perforated plate lowermost On being developed the photographic plate showed impressions of the five perforations A control plate treated in the same manner but not exposed over the spring showed no impression whatever

F Robin has made a series of experiments on the hardness of steel at low temperature using a falling ball 2/5 inch in diameter which gave a blow of about three tons The metals were in bars about two inches long and one inch square They were placed in three refrigerating mixtures producing temperatures of —4 —112 and —300 deg F The temperature —4 deg F was obtained by a mixture of ice and calcium chloride the temperature - 112 deg F by a mixture of carbon dioxide snow and 95 per cent alcohol The lowest temperature —300 deg F was obtained by a mixture of liquid oxygen and nitrogen containing a very large proportion of nitrogen The experimenter finds as Hadfield did an increase in hardness of steel immersed in liquid air but the increase is not progressive, the curve of hardness rising suddenly at —112 deg F and attaining a great height in liquid air Cast antimony also increased greatly in hardness but cooling had comparatively little effect upon aluminium copper lead tin nickel and some other metals Spring steel containing silicon shows little change Chrome steel showed great variation while tungsten steel vanadium steel molybdenum steel, and rapid-cutting steel gained little in hardness on being cooled to the lowest temperature Quenched steels gained considerably in hardness

TESTING A TORPEDO-BOAT DEFENSE.

BY AN EYEWITNESS.

A most realistic test of the value of a boom for the defense of harbors against the attack of torpedo craft has just been made by the British Admiralty In 1904 the submarine mine fields which up to that date had been maintained at the entrance to the principal British naval ports were abolished and at the same time the Brennan torpedo—a weapon operated and directed from the shore by means of endless steel wires—was also discarded These changes were followed by the organization of submarine and torpedo flotillas for the local defense of the ports and simultaneously a great deal of attention began to be paid to the question of boom defense

The latest pattern in these obstructions adopted by the British Admiralty consists of a number—generally from 100 to 150—of balks of timber each about ten feet long tied together by four lines of strong steel hawsers At intervals along its length the boom is attached to pontoons which are themselves anchored to the bottom of the channel by heavy mooring chains Each balk of timber is about a foot square in section and is studded with a number of stout curved steel spikes four projecting from either end and others being placed along the length of the balk at intervals of about three feet The object of these spikes is to prevent the 'jumping of the boom—an incident which has occurred more than once in maneuvers It is achieved by all movable weights—including the crew—being taken aft, thus lifting the bow of the vessel well out of water Then, running at the boom at full speed, the nose would be pushed well over the edge of the boom and the impetus of the vessel and the sudden rushing of the men forward again would in most cases prove sufficient to carry the ship safely across A few years ago however a British torpedo vessel broke her back while trying to jump a boom

It was of course well understood that any vessel larger than a destroyer could easily break any boom yet devised The British Admiralty however after much discussion came to the conclusion that the only vessels likely to penetrate the outer line of British port defenses were destroyers and torpedo boats (including of course submarines) and it was therefore decided to put to a practical test the problem whether a vessel of one of these types could burst through a boom of the latest pattern

A section of a boom of the latest design was therefore erected across a small creek in the upper reaches of Portsmouth harbor In addition to the spikes already described, the boom was furnished with a three-inch wire hawser stretched about three feet above the balks with the object of shearing the masts and funnels from any destroyer which might have the audacity to charge the boom and to force it down on to the steel spikes Five feet below the surface there was another hawser designed to impede the progress of the ship and to foul its propellers.

The attack was intrusted to the torpedo-boat destroyer Ferret an obsolescent vessel of 280 tons, launched in 1893 Her engines are of 4 810 horsepower the designed speed being 27 knots. For the purpose of the test she was strengthened by means of steel plates fixed to either side of the bow but this was only done to give her a greater resemblance to the latest vessels of the destroyer class. Nominally her crew consisted of seventy men but for the purpose of the trials a volunteer crew of ten was selected Lieut J C Hodgson being in command and Artificer Engineer J Hawkesworth in charge of the engines. Before starting the whole of the crew were directed to come on deck as soon as the vessel got within one hundred yards of the boom and to be ready to jump overboard, while a large number of tugs and launches were in the vicinity to pick up the expected pieces. These facts alone are sufficient evidence that the Admiralty officials did not expect the "Ferret" to get through, at any rate without considerable damage to herself

Of the trial itself there is little to say It took place at five o'clock in the morning of July 28th The Ferret left Portsmouth harbor, and, turning round, steamed toward the boom at about fifteen knots. The lieutenant and quartermaster stood on the bridge and at the wheel respectively, and steered a course direct for the center of the obstruction When a hundred yards distant steam was shut off The surrounding pinnaces and tugs closed in the "Ferret" caught the boom between two balks—and went through it as easily as if it had been packthread No shock whatever was felt on board and everyone—engine-room staff and stokers included—remained at their posts, and were in fact, unaware of the fact that the obstruction had been cleared A glass of water left standing on the wardroom table was not even spilled

The hawsers were cleanly cut, and the two halves of the boom swung round with the tide toward the shore

Destroyer "Ferret" as she appeared when approaching the boom at 15 knots speed

The 'Ferret' could easily have proceeded into the dockyard under her own steam, but two tugs took charge of her and later in the day she was docked An examination showed that she was quite undamaged The hawsers had made a dent in her bows but no plates were started and she was making no water It is not believed that she was strained in the slightest degree, but this will not be definitely known until a thorough examination has been made

The experience was practically a repetition of what occurred in 1885 when the torpedo-ram 'Polyphemus" charged and broke a strong boom at Berehaven in Ireland In that case, however, the attacking vessel was a craft of over 2,000 tons, and the boom was not so scientifically constructed as that tested at Portsmouth

It is understood that the Admiralty intend to carry out a series of tests, with the object of discovering a really efficient obstruction for harbor mouths It is suggested that a series of wire entanglements, placed one behind the other will next be tried As was to be expected, the result of the Portsmouth trial has already led to a demand for the reinstatement of the submarine mine defenses of British harbors.

THE FIRST CROSS-COUNTRY FLIGHT OF THE AERONAUTIC SOCIETY'S BIPLANE.

As mentioned in our last issue, Mr. Charles F. Willard has been learning to fly the Curtiss biplane acquired recently by the Aeronautic Society Last week, in the vicinity of Mineola, L. I, Mr Willard made practice flights early in the morning almost daily. On the 14th instant he made a flight in the shape of the letter S of nearly five minutes' duration, in the course of which he traveled about three miles. The following morning, at 5 26 A. M., he started off as usual near the fair grounds at Mineola, but, instead of circling over the plain, he drove the machine above the fair grounds some three miles across country to Garden City At this point he turned to the left and headed for the grounds of the Meadowbrook Hunt Club, passing over a group of men on their way to work, who waved their caps and cheered From this point he flew toward Westbury, swerved to the south, and crossed the Motor Parkway, making several turns. He traveled to the outskirts of Hicksville, whence he directed his machine straight back to Mineola. Before reaching the starting point, however something about the motor gave out, and the machine was forced to descend upon rather rough ground. The landing was made without damage, however. The machine was in the air over nineteen minutes, and covered a distance of about twelve miles. The height attained was about 150 feet. This is the second cross-country flight made in the United States by any aeroplane, the first one being that made by the Wright machine in its government test on the 30th ultimo. Mr Willard traveled somewhat farther than did Orville Wright and Lieut. Foulois, though the ground over which he flew was much smoother and less dangerous in case the machine was obliged to alight This flight surpasses any ever made by Mr Curtiss himself, or by Messrs. McCurdy or Baldwin In addition to being a cross-country flight, it is the longest flight yet made in the United States by any machine other than the Wright. It is probable that further exhibition flights will be made with this machine by Mr Willard in the near future

MR. CURTISS AT RHEIMS

Mr Glenn H Curtiss arrived in France on the 12th instant with his aeroplane which was packed in boxes. The machine was taken as personal baggage directly from Havre to Rheims and after busying himself the following day with its erection Mr Curtiss announced that it was almost ready for trial This will give him a full week in which to tune up the machine and prepare for the races, which start on August 22nd There seems little doubt that Mr Curtiss's new biplane will make an excellent showing against the two score machines with which he will have to compete

THE TRIAL FLIGHT OF THE "BADDECK NO. 1"

'Baddeck No 1,' the new biplane with which Messrs. McCurdy and Baldwin are experimenting at Petewawa military camp in Canada, met with an accident when the first flight was attempted on August 13th The machine reared suddenly in the air and

(Concluded on page 127)

The boom consisted of 12-inch by 12-inch logs, tied together with four lines of heavy steel cable. Three feet above and five feet below the boom were stretched two 3-inch steel cables. At the front end and along the sides of each log were sharp, forwardly-projecting steel spikes. The torpedo-boat destroyer struck the boom between two logs, cut the cables, and passed through unharmed.

Torpedo defense boom before the attack in Portsmouth harbor.

TORPEDO BOOM EXPERIMENT.

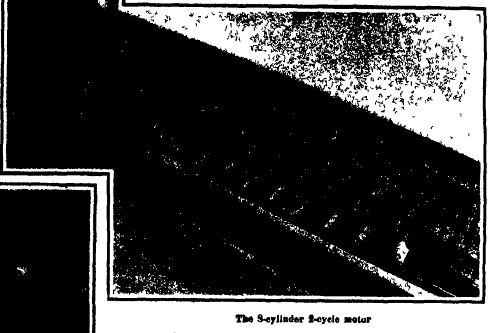
A RECORD CROSS-COUNTRY MOTOR-BOAT TRIP.

BY OUR SPECIAL CORRESPONDENT.

A river trip of 450 miles made in one day between dawn and dark would certainly be a record-breaking performance. Such a trip could hardly be made with the usual type of high-speed motor boat, as neither the engine nor the hull would be likely to stand 15 hours continuous running at a 30-mile clip. The annual French endurance race from Paris to the sea, in which a number of the fastest racers usually compete, is generally run in stages, so that it lasts several days and consists of a few spurts of several hours each. When these facts are considered, one can appreciate the bold undertaking of the Dean brothers, of Cincinnati, O., when they attempted to run their fast boat "Br er Fox II" from Pittsburg to Cincinnati in one day This boat had previously made the 1,554-mile trip from St Louis to New Orleans at a speed of 29.8 miles an hour and altogether had traveled over 3,000 miles at a speed of nearly 30 miles an hour

The start was planned for Sunday, July 10th last, but on account of low water in the Ohio River it was necessarily postponed A demonstration was given the SCIENTIFIC AMERICAN representative of the speed of the boat, however, in a round trip to McKeesport, Pa., a town 20 miles distant. The running time was 39 minutes one way and 41 the other, which was against a slight current. This was an average of over 30 miles an hour Fortunately, within the next three days there was some rain, and the water rose enough in the river to make possible the undertaking of the trip, although only with the running of considerable risk, as the following account shows The start was made from the landing of the Pittsburg Launch Club on Wednesday evening, July 14th, at 7 09 25, with the intention of running through the six dams to Rochester, Pa., that night, in order to make an early start through the open river on Thursday morning, thus avoiding the loss of time in locking through these six locks. A storm came up after passing through dam No 1, and the boat was forced to tie up for the night. Another start was made early Thursday morning, and dam No 6, at Rochester, was reached at 9 25 10, the actual running time through the pools being at the rate of 25 miles per hour

Side view of "Br'er Fox II" under way



The 8-cylinder 2-cycle motor

A RECORD MOTOR-BOAT TRIP FROM PITTSBURG TO CINCINNATI

Rear view of "Br'er Fox II." traveling at high speed.

Below the pools the water was found to be so shallow that it was necessary to cut out four of the eight cylinders in order to reduce the speed of the engine to 500 R P M., or approximately half speed. Below Wellsville, O., the propeller struck the bottom of the river and was bent. It was decided to continue with the disabled propeller until deeper water was reached, as the extra propeller carried on the boat had been damaged on the trip up the river to Pittsburg. It was impossible to make any speed until Bellaire, O , a distance of 95 miles, was reached, although the engine performance was perfect. The boat grounded several times, causing a loss of considerable time, but fortunately little damage was done.

All eight cylinders were put working at Bellaire, but four were cut out again after going about two miles, and but four cylinders were used to Marietta, a distance of 171 miles. Sistersville, W. Va., was reached on Thursday evening at [illegible]. The night was spent here, and a supply of gasoline and cylinder oil was taken aboard. Leaving Sistersville at 6:27:10 on Friday morning, a quick run was made to Petticoat Bar, [illegible] down the river. The propeller struck the bar while the boat was running nearly at full speed Two blades were stripped from the wheel, and the boat was paddled to the bank, where the other propeller was put on. The shaft was bent slightly just in front of the propeller The accident happened at 7 A. M , when all eight cylinders had been put on for a short time, as there appeared to be about three feet of water The start was made from Petticoat Bar at 8 43 40, the engine running on four cylinders, and no further changes were made until Marietta was reached at 10 22 05, where there was considerably more water owing to the Muskingum River flowing into the Ohio at that point.

Full speed was maintained until near Ravenswood 218½ miles from Pittsburg where a stop was made to replace the batteries. The boat is equipped with a magneto, but this had been disabled in the storm on Wednesday night, and was out of commission From Ravenswood to Ironton 106½ miles the engine was run at full speed continuously, and not a single adjustment of any kind was made Had it been possible to run at this rate of speed with the same amount of water down from Pittsburg, there is no doubt whatever that the run could have been made from that city to Cincinnati in one day The performance of the engine on such high speed for such a distance is nothing short of remarkable, and is a triumph for the manufacturer of the two-cycle engine No part of the engine heated up at any time, and not an explosion was missed Vanceburg, Ky was reached at 7 13 Friday evening The boat was tied up for the night, and a supply of gasoline and cylinder oil was taken on A fresh start was made at 7 22 on Saturday morning, and the run to Maysville, Ky , was made without stopping or slowing down the engine The landing at Maysville was reached at 8 38 50, thus making the 30½ miles between those cities in 1 16 50, and this with a bent propeller and shaft Such a performance by a badly disabled boat is truly remarkable and particularly when it is taken into consideration that while the "Br'er Fox II" is designed to carry a crew of but two, she carried a crew of four on this trip, and 85 gallons of gasoline instead of the 30 gallons which are generally carried

At Maysville a telegram was received from Cincinnati asking that the boat's arrival be planned and timed for one o'clock, as the launch clubs of that city had planned a reception at that hour The boat was accordingly held at Maysville until 10 49, when the start was made for Cincinnati, 60 miles distant. The engine was then run without change of speed or adjustment until the Ohio River Launch Club was reached, where ten minutes were lost in taking on an extra can of gasoline, the supply having run short. Cincinnati was reached at 1 15 45 where the boat and occupants received a rousing reception from a large crowd The run from Maysville to Cincinnati was made at the rate of 26 54 miles per hour, the fastest long run on the trip

The actual running time for the trip from Pittsburg to Cincinnati was 21 hours 35 minutes, and 25 seconds which is a new record by water between these cities. This was at an average rate per hour of 21 25 miles, a most notable performance for a disabled boat in low water where two-fifths of the entire distance was made under half power At least ten per cent additional distance was covered on this trip due to the necessity of crossing and recrossing the river in order to keep in the channel, maneuvering which would have been unnecessary had there been a sufficient stage of water to permit running straight ahead and cutting the bends and curves in the river The crew on this trip was composed of M. B. Dean, captain, William Stevenson, engineer James Rowley pilot and George D Steele representing the SCIENTIFIC AMERICAN It is the intention of Mr Dean, who is one of the owners of the Br er Fox II to make another attempt at a one-day trip from Pittsburg to Cincinnati this fall when there will be a better stage of water in the Ohio River With proper conditions there is but little doubt of his accomplishing the remarkable feat The second attempt will probably be made with another type of boat as the Fox Company is installing its 8-cylinder motor in a hydroplane craft that it is thought will prove very speedy

The Br er Fox II was planned and assembled by Mr A G Dean, one of her owners and also one of the officers of the Fox Reversible Gasoline Engine Company of Newport Ky She is 40 feet in length 4¼ feet beam and draws about 26 inches of water The hull is of rib and carvel construction planked all over with ¼ inch white pine and weighs without engine and equipment, about 625 pounds. She is built on racing lines, and was designed and constructed by Wright brothers, of Newport, Ky

The power equipment consists of a Fox motor rated at 56 to 65 horse-power This engine is unique in that it has eight cylinders of the two-cycle type arranged in line above an 8-throw crankshaft. In appearance the motor is similar to the usual two-cycle engine excepting that the cylinders are set farther apart to permit the use of wider bearings The cylinders are all 5 inch bore by 5 inch stroke and the base is a solid one-piece aluminium casting The crankshaft is cut from a solid steel billet, and the throws are set to fire the cylinders 1, 5, 2 6, 3 7 4 8 At a speed of 800 R. P M this gives 6,400 piston oscillations per minute and results in wonderfully steady and efficient power

The one special feature of this motor is the design and location of an auxiliary fourth port, which is now being patented Through this port air is drawn into the explosion chamber slightly in advance of the incoming charge of gas, and this injection of air accom plishes the double purpose of expelling the burned gas without waste of fuel and leaving pure air in the explosion chamber instead of vitiated gas

These fourth ports can all be operated together by means of a lever, and when opened, result in a marked increase in both power and speed High tension ignition by means of two distributors and two coils is employed Lubrication is effectually accomplished by a force-feed system into the journals and by a spray taken by the incoming gas to the wrist pins, connecting rods and pistons A clutch of the self locking type is used but no reversing gear is required, since the motor is readily reversible

As is customary with boats of this type the exhausts are open and extend several feet above the sides of the boat These exhausts are 2½ inches in diameter

The motor drives a 22 inch diameter 44 inch pitch wheel at from 750 to 800 R P M with ease and in short test runs has turned this wheel at from 810 to 825 R P M in the Pittsburg pools giving a speed in excess of 30 miles per hour in the slight current of those pools. On the run from Pittsburg down the Ohio to Cincinnati the engine kept up a steady speed of from 750 to 775 R P M without forcing and maintained this speed for hours at a time without perceptible heating This speed could be maintained easily for an entire day or even more were the stage of water sufficient to permit the boat to run at such speed in safety

In the run to Cincinnati, four gasoline tanks were carried two rear tubular tanks in the stern each having a capacity of 15 gallons one 20-gallon tank under the seat one 30 gallon tank in front of the seat and one 5-gallon gravity feed tank directly over the 30 gallon tank making a total capacity of 85 gallons for long runs The tanks all feed into the 5-gallon gravity tank a hand pressure pump forcing the contents of the lower ones to this gravity tank Besides an individual carbureter for each cylinder the transfer pipes of each pair of cylinders are connected to a second carbureter so that there are no less than 12 carbureters used on the engine

Based on rated power the motor in the 'Br'er Fox II consumes approximately 1 4 pints of gasoline per horse-power hour but the engine unquestionably delivers more than its rating so that on actual wheel performance turning a 22 inch diameter 44 inch pitch wheel 800 R P M it is very close to a pint per horse power hour

The boat has a capacity of 14 gallons of cylinder oil in tanks She is designed to carry two men averaging about 155 pounds each and 30 gallons, or about 240 pounds of gasoline On the trip from Pittsburg to Cincinnati she carried four men whose combined weight was 670 pounds and 85 gallons of gasoline, weighing approximately 600 pounds or a total of 1 270 pounds against 550 pounds which is her estimated capacity when speeding

◆

The Current Supplement.

The opening article of the current SUPPLEMENT No 1755 is devoted to a discussion of the wonderful Frankfort Aeronautical Exposition which has been opened with such success in Germany Excellent views of the exhibits accompany the text Mr E F Lake s exhaustive and instructive article on the oxhydric process of cutting metals is continued Mr Newton Wright explains how the size of gas and oil engine cylinders may be determined It is a curious fact that many of the marbles employed by the Romans Greeks and even Egyptians are those most highly valued by the architects and builders at the present time Marbles and other decorative stones from the identical localities which were sought by the ancients with so much care are now to be seen in most fine modern buildings in London and other cities This whole subject of ancient marbles and ancient marble quarries constitutes the subject of an article by Mary W Porter O Bechstein contributes a wonderfully instructive article on kieselgur and its uses The experimental evidence in support of the atomic hypothesis is set forth by R Ehrenfeld Maria Parloa s monograph on canning and preserving fruit is continued Interesting electrical notes are those entitled How to Join Electric Wires and The Egner Holmstrom Telephone Apparatus It is sometimes necessary when designing buildings or other works to construct models in order to explain intricate points more clearly than can be shown in drawings How this is done Mr Stanley C Bailey explains. Improved deep-sea sounding apparatus is described by Capt E Moll A report of the Sixth Conference of the International Commission of Meteorology is published A calendar good from 1763 to 1952 is not the least interesting feature of this issue

◆

From the returns compiled by Lloyd's Register of Shipping it appears that excluding warships, there were 308 vessels of 745 705 tons gross under construction in the United Kingdom at the close of the quarter ended June 30th, 1909.

Correspondence.

THE NUMBER OF OUR ANCESTORS

To the Editor of the SCIENTIFIC AMERICAN

The difficulty that some of your correspondents have with the ancestral puzzle is in disregarding the marriage and intermarriage of distant relatives Thus if one of B s grandparents on his mother's side was cousin to one of his grandparents on his father s side, B would have only 14 great-great-grandparents The one divergent series would be extinguished and the number of his ancestors in any one generation would be $2^n - 2^{n-4}$ If, instead, two of his eight great-grandparents were cousins the formula would be for any generation $2^n - 2^{n-5}$ If there were two sets of cousins among his great grandparents the formula would be $2^n - 2(2^{n-5})$, etc

When we consider that our ancestors for hundreds and thousands of years lived in small and more or less isolated villages and communities and that families of as many as ten or twelve children were not uncommon, we can see that could we trace all lines of descent of any one person we would find them constantly running into each other and merging into common ancestors. Thus in the fifteenth generation we might trace descent from two parents through any one or through all of their twelve children And if the blood of these children had commingled at other times in the line of descent, as it must at least in an isolated community, two persons in the fifteenth generation might represent a hundred or even several thousand of B s theoretical ancestors

THUNDERSTORMS

To the Editor of the SCIENTIFIC AMERICAN

The explanation of thunderstorms ordinarily given is that clouds are formed of minute particles of moisture, each having an electric charge on its surface These particles agglomerate in drops of rain and their electric charges spread over the surface of the drops with a resulting greater electric density because the surface of a drop is much less in extent than the aggregate of the surfaces of all the particles of which it is made the increase in surface being proportional to the square of the diameter, when the increase in volume is proportional to the cube of the diameter For instance the electric potential (depending on the electric density on its surface) of a drop of rain ⅛ of an inch in diameter will be 125 volts, if it is formed of particles 1/1,000 inch in diameter whose potential is one volt

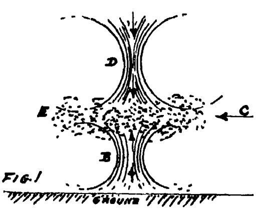

FIG. 1

The drops of rain in a cloud being separated by air acting as a dielectric, electrify each other by influence, the resulting influence at the center of the cloud being an enormous electrostatic strain, which is relieved by lightning

This simple explanation is that generally given in the lecture room but is not sufficient to explain the thunderstorms without rain frequent on the Western plains in hot dry weather The writer has observed many in northwest Texas. One day at noon I was resting in my house, when I was startled by a sudden clap of thunder followed by others. I had not seen a sign of a cloud a few minutes before when coming home Stepping out doors, I saw toward the zenith a very thin yellowish cloud somewhat broken, from which emerged the thundering No lightning could be seen, the glare of the sun through that misty cloud being too intense. From its rapid motion and the distinctness of the claps of thunder I judged that it could not be very high This phenomenon lasted about three minutes and vanished

The appearance of that cloud was unusual for a dry thunderstorm Ordinarily, in such occurrences there are several scattered small white clouds, embryo cumuli in shape but diaphane, they look "dry," and do not cast any appreciable shadow on the ground They appear and vanish with more or less sharp thunders seemingly at a high elevation. No lightning can be seen because of the sunshine through them. These electric discharges begin about noon, to last until about two hours before sunset. During the day there are occasional flashes of breeze, but no continuous wind in a certain direction.

This condition of weather may last without rain for two or three weeks, and is generally followed by a stubborn drought, with a smoky appearance of the sky and very little or no dew in the morning. The absence of rain, the small size of the clouds, and their diaphane, evanescent appearance, indicate that other agencies besides those mentioned in the lecture room are active for the presence of electric potentials widely differing in a dry thunderstorm

Observations have shown that the electric potential of the air increases with the distance from the ground. Now suppose that a portion of the upper atmosphere be brought near a portion of the nether atmosphere within a medium like mist, where electrification by influence can take place, the requisites for an electric discharge are present and apply to dry thunderstorms. They occur when atmospheric conditions are favorable for causing local ascending currents of warm air with a small quantity of aqueous vapor to an elevation where they meet a cold current, whose cooling effects contract the hot air and condense the vapor it contains, creating a vacuum that sucks the air from the highly electrified upper atmosphere as shown in Fig 1 where *B* is a warm ascending current, *C* is the initial cooling current (which has disappeared), *D* is the descending current and *E* the cloud formed by the condensation of the vapor in the ascending current *B*

From the absence of rumbling thunder the electric discharges seem to be confined within each separate cloud and originate mainly from differences of potential brought from different strata in the atmosphere

The ordinary thunderstorms with rain happen also when atmospheric conditions cause ascending currents of warm air containing aqueous vapor. There is low barometer and a preceding period of calm high temperature, the clouds are cumuli and pile very high up, especially for hailstorms

When rain is brought by a wind that has been blowing for a few hours or days in the same direction the clouds are of the nimbus class, they overcast the whole sky, and though the drops of rain may be large there is no appreciable thunder and lightning the electric potential being too uniformly distributed throughout the cloud.

THE EFFECT OF POLAR CURRENTS ON GULF STREAM PLANKTON

To the Editor of the SCIENTIFIC AMERICAN

It was announced some time ago that very interesting communications were to be published shortly from the pen of Prof Frithjof Nansen and assistants upon the most recent results of the investigations which have been carried on for a series of years with a view to ascertaining the influence which the water in the polar currents has upon the water in the Gulf Stream in the way of creating very favorable conditions of existence in the latter for plankton and higher marine life

The results may be shortly summed up thus From the investigations carried on during the "Fram's" voyage across the north polar basin it has been proved conclusively that in the polar water which is protected by a thick layer of ice from the influence of light, accumulate matters which have a fertilising effect upon the vegetable life in the open sea and which in the cold, dark polar water are not used The polar basin is like a large tract of fallow land in which fertilising matters accumulate without being used

The warm water in the Gulf Stream on the contrary, when reaching the northern part of the Atlantic is desert water so to say It has been used up and contains only scanty means of subsistence for any animal life

The more polar water that sets in and mixes with the warm water in the Gulf Stream the more luxuriant seems to be the growth of plankton and higher marine life It is the cause of colder summers in northern Europe, but the fisheries seem to be better in proportion

The results of these investigations, of which only a short summary is just published in the press, will be issued in book form, and seem to open up prospects of our being able to foretell good or poor fisheries and to explain many interesting phenomena which seem to be dependent upon the temperature in the northern part of the Gulf Stream

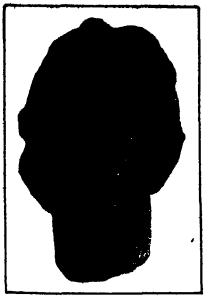
Rubber Substitute.—According to a foreign patented process, a substance resembling rubber or gutta percha is produced by mix'ng [illegible], bichromate of potash, and glycerine, and [illegible] the mass obtained. The components are used in an anhydrous state, to retard the working of the bichromate of potash on the gelatine; by heating, the chemical effect may be increased or reduced.



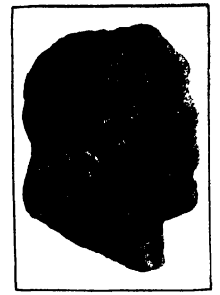
THE EXCAVATIONS AT DELOS

BY THE

PARIS CORRESPONDENT

OF THE

SCIENTIFIC AMERICAN



In 1908 excavations in the island of Delos were begun on an extensive scale, owing to the liberality of the Duc de Loubat, who decided to make an annual gift to the enterprise of $10 000 in order that the work could be carried on in a manner which is justified by the great importance of the site The work is carried on by the French School of Athens and M Homolle, whose connection with the excavations at Delphi we have already had occasion to note, directed the first part of the enterprise Since then it has been carried on by his successor M Holleaux and various archæologists of the French School Because of the great number of discoveries which have been made at Delos the archæological world is much indebted to the action which the Duc de Loubat took in aiding the excavation work

From an early period going back to the eighth century B. C Delos was a center of the worship of Apollo who had a celebrated sanctuary on the island After passing through many political vicissitudes, Delos was completely ravaged by the army of Mithridates. Its most flourishing period appears to have been in the third century B C

Since Delos was a religious as well as a commercial center it is but natural that we should find remains both of various temples and also of extensive buildings such as storehouses and wharves In general, we may liken the site of Delos to Pompeii, because it is covered with remains of public and private buildings But naturally it is far superior to Pompeii in the artistic character of the structures and other remains, for here is represented a flourishing period of Greek art. For this reason the excavations at Delos are of especial interest and the remains have a high artistic value. On the one hand we have specimens of sculpture which belong to the principal epochs. There are also extensive remains of architectural forms, columns etc. Not the least in importance are the fragments of mural decorations which are found in various places While these are not in so good a state of preservation as those of Pompeii they give a clear idea of the decorative borders friezes and large wall paintings that adorned the larger dwelling houses of Delos Mosaics of brilliant colors are also found and some of these are in a good state of preservation

The excavation work is carried on with a view to clearing as much as possible the streets and edifices of the site In the quarter of the port, very extensive wharves have been disclosed as well as large quays and storehouses, evidences of considerable commercial activity It is evident from their extent that Delos was one of the most important commercial ports of the archipelago

As regards the work which has been undertaken at Delos since 1903, the year when the Duc de Loubat came to the aid of the enterprise it is one of the most considerable to be carried out in Greece, so far as the amount of material is concerned This is no less than 50,000 cubic yards of earth annually As the various walls were brought to light they were consolidated to keep them together and efforts were made to preserve the stucco decorations and mural paintings. The appearance of the paintings, mosaics, and various decorative *motifs* is shown in a collection of water-color drawings which were made on the spot by two artists belonging to the expedition

Among the points which have been explored up to the present are the sacred inclosures in which was the leading sanctuary of Delos, also the quarter of the Theater Near the inclosure is the sacred lake, a small body of water One of the most remarkable finds is a tomb belonging to the Mycenæan epoch, to which we may assign a date between the twelfth and the fifteenth century B. C. Thus we remark the great antiquity of the early remains of Delos, showing that it flourished at even this remote period On this spot were found fragments of pottery which are of value in the study of this epoch A great terrace or esplanade was uncovered near the sanctuary Here were found five colossal lions which were set up in a range and spaced at equal distances apart along the terrace One of our engravings shows the appearance of this site and another one represents one of the lions, showing the considerable size and also the great antiquity of the specimens. They rank in date after the above-mentioned tomb, and from their archaic character we may place them in the seventh century B C M Salomon Reinach however, considers that the group of lions may have been offered to the sanctuary by Croesus, King of Lydia, fabled for his riches. He bases his theory on the fact that Herodotus states that Croesus had offered a massive gold lion to the temple of Delphi having a weight of ten talents the lion being the ancestral sign of the king s family It is possible, therefore that the group at Delos may have come from the same source and this would place them in the sixth century

Coming to the remains of a later epoch we find a street which led from the theater to the sanctuary a very narrow street only five feet wide It was bordered with small houses and shops and must have been much frequented

As to the general character of the excavations at Delos as they appear at the present time one of the accompanying views will give a good idea of the extent of the work It will be observed that it covers a very wide area. Like modern buildings in some countries the dwellings of Delos consist of a central court surrounded by a portico with columns opening into which were the various rooms of the building Some of the columns in this and other structures of a like character are in a good state of preservation and the walls in some cases are high The remains slightly resemble the dwelling houses at Pompeii One of the dwellings, which has a considerable interest is similar to the above and is known as the "villa of Cleopatra" Here the portico is upheld by high Doric columns. There were found here the statues of the owners of the villa, Dioscourides and his wife Cleopatra (who has of course no relation to the Queen of Egypt) The latter statue which is shown here is in a good state of preservation although the head is unfortunately missing. An inscription on the statue relates that Cleopatra, native of the town of Myrrhinonte in Attica, executed the statue of her husband which is the accompanying one and that he himself had offered two silver tripods to the temple of Apollo As the inscription bears the name of the archon Timarchos, we are able to fix the date of the statue in the second century B C The draped statue retains some of the characteristics of the grand epoch in its treatment.

A NEW APPLICATION OF THE DIVING BELL.

BY THE GERMAN CORRESPONDENT OF THE SCIENTIFIC AMERICAN

A remarkable diving bell or portable caisson has recently been constructed for the German Navy Department for use in the deepening of the harbor of its naval base at Tsingtau The remarkable features are not so much those of the bell itself but of its connection with the imposing structure above water shown in our frontispiece, the whole making a complete and self-contained unit for excavating to a maximum depth of 15 meters below water level

Two pontoons, each 16 5 meters long 5 6 meters wide, and 2 2 meters deep, are rigidly braced together bow and stern forming between them a well into which the diving bell may be completely withdrawn from the water Upon the deck of the joined pontoons is erected the superstructure, from which the diving bell is suspended and operated consisting principally of conventional I-beams and angles.

The diving bell is built of sheet iron externally braced, and is 10 meters long, 5 meters wide, and 2½ meters high Extending upward from the top of it are three telescopic shafts, two for the hoisting of the excavated material each 80 centimeters in diameter, through which a bucket of 1 ton capacity can pass, and one of 1 meter diameter for the workmen Each of these is provided with such an air lock as is now familiar in connection with tunnel and foundation work in New York and elsewhere in which as workmen enter the air pressure is gradually raised from that of the atmosphere to that required to exclude water and mud from the interior of the caisson being similarly reduced for those ascending from work The air locks of the spoil shafts are identical but the air may be compressed or exhausted much more rapidly in the hoisting of buckets of excavated material the gradual change of pressure being necessary in the case of men only as a precaution against caisson disease

The bell is suspended by four sets of chain tackle, one at each corner which are mounted on opposite ends of two shafts on the operating platform of the superstructure driven simultaneously by an electric motor when it is desired to raise or lower the bell

Higher platforms carry two cranes which receive the buckets of excavated material from the top of the spoil shafts and deliver them into scows alongside or however desired the cranes also being electrically driven as are the winches inside the spoil shaft for hoisting the buckets from the interior of the bell One man on the platform at the top of each of the latter can hoist the bucket with the winch detach it, and hook it onto the crane and *vice versa* and also raise and lower the bell as desired Two more operators for the cranes above are required

On the deck are three compressors supplying the necessary air pressure to the interior of the bell power for the whole equipment being supplied from a stationary plant on shore Both the superstructure and the interior of the bell are electrically lighted and communication is maintained between them and from either to the shore by telephone Quarters for the crew are provided in the interior of the pontoons

The design of the superstructure permits of continuous operation being carried on independently of the varying height of the pontoons due to rise and fall of tides.

THE FIRST CROSS-COUNTRY FLIGHT OF THE AERONAUTIC SOCIETY'S BIPLANE

(Concluded from page 125.)

fell backward breaking the rudder and propeller and damaging the running gear Mr McCurdy the aviator was unhurt and the engine was not damaged The accident is said to have been due to the engine being placed too far to the rear The machine will be repaired in about a week when further flights will be attempted

M SOMMER'S RECORD FLIGHT

The record endurance flight of 2 hours and 27½ minutes in France mentioned in our last issue was wrongly attributed to M Gaudart This flight was made by M Roger Sommer with a Farman-type biplane and although unofficial it is probably the longest ever made with an aeroplane

◆

In an article appearing in the American Machinist on annealing high-speed steel the author states experiments have been carried on looking to electrical annealing and to bright annealing by immersion in a bath of fusible metallic salts somewhat after the manner of the barium-chloride process for hardening Moderately successful results have in some cases been obtained, but the methods are not as yet sufficiently developed for commercial use The two methods have also been combined with results apparently good the salts bath being heated by the passage through it of a low-tension electric current

SOME RECENT REMARKABLE DISCOVERIES AT DELOS.

CONJUNCTIONS OF THE PLANETS.

BY PROF FREDERIC R. HONEY, TRINITY COLLEGE.

The purpose of this article is to treat of only that part of the general subject of planetary configuration which relates to a comparison of the planets when they have the same right ascension, i. e, when they are on the same celestial meridian

Six conjunctions of the planets occur during the latter half of the present year One illustration is a plot of the orbits of the terrestrial planets, showing the positions of the earth and of the planets at each conjunction The other shows the apparent diameters and phases magnified In order to compare the figures they are all drawn to the same scale The apparent distance between the planets at each conjunction however cannot be represented on this scale because the figures would be separated by a measurement which would fall beyond the limits of the drawing, but the distance seen by the naked eye, is given in the text The date of conjunction is Washington mean time.

CONJUNCTION OF MERCURY AND NEPTUNE

July 23d 0h The distance between the planets is a little more than twice the moon's diameter which subtends an angle of about ½ deg Neptune's diameter is nearly eleven and one-half times the diameter of Mercury (= 34800/3030) At this date Neptune's distance *from the earth was about thirty-one times* the mean distance between the earth and the sun (= 30 9 × 92 9 million miles), while Mercury's distance was only one and one-fifth times this unit (= 1 195 × 92 9 million miles) The apparent diameter of a planet is proportioned to its true diameter and inversely as its distance from the earth The result of a simple computation shows that Mercury subtended a very much larger angle than Neptune

The plot shows that the planets are morning stars and that Mercury's phase is gibbous. In this and in the illustrations which follow, the arrow drawn with the full line shows the direction of the planet as seen from the sun, and that drawn with the dash line as it is seen from the earth On account of the great distance to Neptune the convergence of these visual rays is scarcely perceptible in the drawing

CONJUNCTION OF VENUS AND JUPITER.

August 11d 14h Jupiter and Venus are evening stars. The former is daily receding farther from the earth and will be in conjunction with the sun on September 17th after which date Jupiter will be morning star Venus presents the gibbous phase, and at the time of conjunction the relative diameters of the planets appear as shown in the illustration The computations for *these figures are similar* to those which have been explained The great difference between the equatorial and polar diameters of Jupiter are apparent The planets are separated by a distance equal to two fifths of the moon's diameter

CONJUNCTION OF MERCURY AND JUPITER.

August 24d 19h The planets are evening stars and are at a distance apart equal to one and a third times the moon's diameter Mercury shows the gibbous phase the dark edge being opposite from that shown on July 23rd

CONJUNCTION OF VENUS AND URANUS

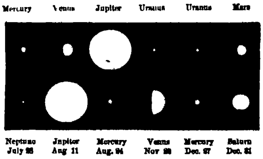
November 23d 8h The planets are evening stars and may be seen a long time after sunset Venus is rapidly approaching the earth and as a consequence the planet's diameter is increasing An inspection of the plot shows that a little more than one-half of the illuminated surface is visible Venus will soon present the half moon phase which will be succeeded by the crescent phase when she will be the most beautiful object in the evening sky The planets are separated by a distance equal to about five times the moon's diameter

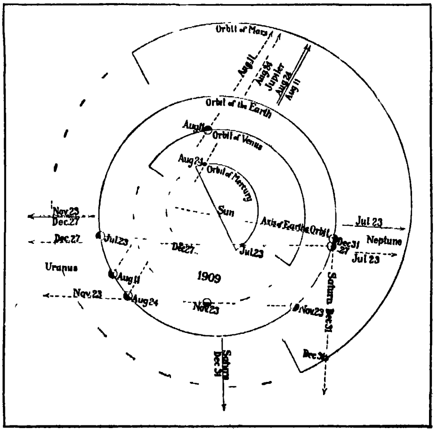
CONJUNCTION OF MERCURY AND URANUS.

December 27d 15h The planets are evening stars. Mercury shows the same phase as that of August 24th, and since the distances from the earth are very nearly equal the apparent diameters are equal The diameter of Uranus is about ten and a half times that of Mercury but its distance from the earth reduces its apparent diameter to that shown in the figure. The distance separating the planets is equal to about three and a half times the moon's diameter

CONJUNCTION OF MARS AND SATURN

December 31d 2h Again the planets are evening stars. Mars shows the gibbous phase and his distance from the earth is about equal to that between the earth and the sun The apparent distance between the two planets is nearly six and a half times the moon's diameter The great difference between the equatorial and polar diameters of Saturn is very apparent. Although Jupiter's diameter is scarcely one and three-sixteenths times that of Saturn, the diameter of the latter is very much reduced on account of its greater distance from the earth.





CONJUNCTIONS OF THE PLANETS IN 1909

An American Exposition in Berlin in 1910.

What promises to be a unique event in international commerce will take place under distinguished auspices in Germany's capital next year

In a recently erected permanent exposition building known as the Exposition Palace near the Zoological Gardens, in the best section of Berlin, an exposition of American products exclusively, among which tools and machinery will form an important part, will be held during the months of April, May, and June, under the patronage of Prince Henry of Prussia

This exposition is designed to stimulate and strengthen our trade with Germany a trade the importance of which may be gaged from the statement that Germany bought nearly $277,000,000 worth of goods from the United States in 1908 and is America's second best customer Prominent men on both sides of the Atlantic will co-operate to make the undertaking a success.

The exposition commends itself particularly because of the fact that there will be no drudgery connected with it for the exhibitors The space rental will include all incidentals such as the decoration of the booths, foundations for the exhibits and carpeting janitor service the storing of the packing material, protection, insurance, etc The large steamship companies have granted substantial freight reductions, and exhibits will be admitted into Germany free of customs duty

Some of the most prominent manufacturers in the United States are signatories to an invitation to participate in the exposition For the exhibitors' convenience an office has been established in the Hudson Terminal Building, New York city

---

The 'Parahyba,' the sixth of the ten destroyers ordered by the Brazilian government from Yarrow & Co Limited, of Scotstoun, ran an official full-speed trial a few days ago on the Skelmorlie mile. She attained a speed of 27.29 knots.

Poisonous Honey.

BY PROF. KARL SAJO.

Illness, and even death, are sometimes caused by eating natural honey, free from all adulterations. The writer is not aware that any fatal cases of poisoning have occurred in Europe. They are reported exclusively from America and Asia. Almost all cases are caused by the use of honey derived from the flowers of plants of the Alpine rose and heath families (*Rhodoraceæ* and *Ericaceæ*) The matter is somewhat puzzling, because cases of severe poisoning are very rare. For example, the American cases, which are attributed to *Kalmaia angustifolia* and *K latifolia*, are only two in number, although these plants are common in America. Even in Europe, illness is sometimes produced by eating honey I have myself witnessed several mild cases, one of which appears to throw some light upon the subject. Some children, who were watching their teacher cleaning honeycomb, asked him the nature of the dark and acrid paste with which some of the cells were filled The teacher explained that this was bee bread The children asked if it was fit to eat, and the teacher carelessly answered, "yes." The children ate the bee bread freely despite its unpleasant taste, and all became extremely ill.

The reader doubtless knows that bees fill certain cells partly with pollen, which is necessary food for the *development of the* young bees, as it contains albuminoids, while honey contains only carbohydrates. This pollen is known as bee bread It is usually stored in certain special groups of cells, which can be easily separated from the honey cells. Sometimes, however, the bee keeper, to his disgust, finds in the honeycomb, intermingled with the honey cells, many cells which contain pollen Often the lower part of a cell is filled with pollen, and the upper part with honey In the case above cited, the poisoning was evidently due to the pollen, for persons who ate the honey from which the bee bread had been removed experienced no ill effects. I know, from personal experience, that the eating of honeycomb which contains bee bread often produces unpleasant symptoms and loss of appetite.

Several possibilities suggest themselves. The pollen may be naturally poisonous, for many pollen grains contain toxines, as was proved by Prof Dunbar in his investigation of the cause of hay fever It is possible also that the pollen stored in the cells may become decomposed and thus produce disease germs and poisonous substances. If the bees wish to preserve their stores of pollen, which are not usually protected by large additions of honey they are obliged to add large quantities of a secretion containing formic acid, and it is not impossible that, in this operation large doses of the alkaline poison of their stings may also be added

In view of these facts, it appears probable that the cases of poisoning attributed to honey are really caused by pollen If this is true, the frequency of such cases should be diminished by modern methods of bee keeping in which a compartment of the hive is reserved exclusively for honey, and the bee bread is almost entirely deposited in cells attached to the broodcomb, in another compartment. Furthermore honey is now seldom pressed from the comb, but is almost entirely extracted by centrifugal separators, in which the semi-liquid honey flows out of the cells, leaving the more solid bee bread behind. In the case of honey in the comb, the presence of bee bread cells is easily detected by inspection or by the taste, and a little care in removing them will prevent any evil consequences.—Translated from Prometheus.

Washable Water-Color Paint.

Washable painting in water colors can be executed by mixing the pigments with plaster a fusible salt, a suitable glaze, and an acidulated solution of gelatine. The paste thus formed is applied like paint and, after it is dry, is hardened by heating the painted objects. The following proportions and method are recommended;

Ten parts of glue are dissolved in 100 parts of hot water containing a little acetic or other acid After this solution has cooled it is rubbed up with 5 parts of plaster, 5 parts of soda, potash or borax, 30 parts of lead oxide or zinc white, and the necessary quantity of the water color pigment desired. The coating, when dry, is heated by means of an alcohol or other smokeless flame. The finished coating resembles enamel. It is not affected by rain or heat and may be lacquered without difficulty.

A NOVEL SOLUTION OF THE PROBLEM OF TELEPHOTOGRAPHY.

BY DR. ALFRED GRADENWITZ.

Many inventions have recently appeared for the telegraphic transmission of handwriting, drawings, and photographs. Ingenious though they be, nearly all of these devices have never passed the experimental stage, which circumstance is partly due to the extraordinary sensitiveness and complicated construction of the mechanism employed. The main difficulty met with in solving this interesting problem, however, lies in the means of obtaining and maintaining a perfect agreement between the working of the transmitting and receiving stations. In fact, an accurate reproduction cannot be obtained except by causing identical parts of the original and reproduced pictures to pass at equal times in front of a given point. On the other hand, the two picture rollers should perform their respective motions in equal intervals of time.

These difficulties, it is claimed are successfully overcome by the "teleautocopist" an apparatus recently invented by Laurent Sémat and constructed by F Ducretet and E. Roger of Paris. Moreover the machine is well adapted for the transmission of musical notes, shorthand records, prints and—a matter of especial importance for the criminal police—sketches or anthropometrical data.

The roller used at the transmitting station has a larger diameter than the receiving roller A motor which requires no superintendence is used to actuate both Different in diameter and accordingly different in peripheral area, the rollers, nevertheless, reproduce a picture exactly the size of the original

On the smaller roller of the transmitter (represented in Fig 1) is wound a metal foil on which the picture to be transmitted is drawn or printed The style which touches this foil serves to throw into the circuit the current impulses that will reproduce the picture Whenever a conducting portion of the metal foil is struck the circuit is closed, and on passing over an ink-coated portion the circuit is opened

On the larger roller (at the receiving station similar to Fig 1) is wound a sheet of carbon paper and upon this, a sheet of ordinary paper Assuming the difference in the peripheral areas of the two rollers to be ⅛ the reproduction of the original picture on the larger roller will take up only ⅞ of its peripheral area. The peripheral speeds of the two rollers are chosen at the opposite ratio of their peripheral areas that is, the smaller roller performs a full revolution in ⅞ of the time of revolution of the larger one. Again, the first-named roller after completing one revolution, is stopped and is not started again until the other roller has moved on through the disengaged eighth of its peripheral area. The process is repeated with each revolution When starting from a given point, the two rollers are accordingly seen to pass in front of the style at equal times through equal lengths of their peripheral area the longitudinal displacement is identical on the two rollers in the reproduction of original dimensions In order however, to reproduce in a magnified or reduced size, the relative diameters and displacements of the rollers are proportionately altered

Besides the advantages afforded by the simplicity and perfection of synchronism the Sémat apparatus dispenses with any selenium cells and photographic views, all operations being performed in full daylight, merely by means of mechanical devices. No special knowledge is required for adjusting the apparatus, which is readily connected with any ordinary telegraph or telephone line.

The speed of transmission is easily raised to five minutes in the case of pictures measuring 7 x 12 centimeters.

The inventor, who is an official of the Egyptian railways, has recently made some successful experiments on this apparatus, at the Khedival Palace at Cairo when the telephotographic record reproduced herewith was obtained. The apparatus was then installed at the annual exhibition of the French Physical Society and there demonstrated

The mechanism for obtaining accurate synchronism comprises an armature which arrests a peg fixed to the transmission roller, as long as its electromagnet is excited At the receiving station is installed an interrupter, which opens the current each time it is struck by a cam rigidly connected with the roller

As the speed of rotation of the (smaller) transmission roller is higher than that of the (larger) receiving roller, the former, after each revolution, is arrested by the armature striking the peg until the large roller (which turns at a correspondingly lower speed), by interrupting the circuit, allows the electromagnet to relieve its armature and accordingly the stop

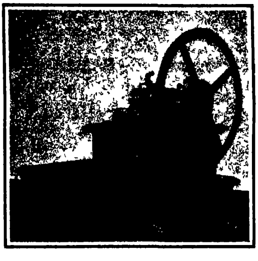


Fig. 1.—View of the transmitting apparatus, identical in appearance with the receiving apparatus

Cement from Blast-Furnace Slag.

Cement is made from blast furnace slag by various methods Among the newer processes are the following

Canaris Process.—The slag is granulated in a milk of lime made from freshly-slaked lime in a vessel provided with a stirrer Two parts by weight of anhydrous lime (CaO) are employed for each 100 parts of slag

Collosseus Process—Slag in the fused state is treated with solutions of salts of calcium magnesium or aluminium. The action is twofold The physical structure of the slag is altered and chemical changes are effected by which the injurious ingredients especially sulphur are made harmless and even conducive to proper setting and hardening

Muller Process.—For certain purposes it is advantageous to substitute salts of barium or strontium for the salts of calcium etc

Grau Process—A jet of dry superheated steam is projected upon fused slag in such a manner that the slag falls in the state of powder and forms a pile which is allowed to cool slowly in order to prolong the effect of the heat and steam

◆ ◆ ◆

The new process of Dr Ekenberg for converting raw peat into fuel is based on the fact that after the peat has been heated in the presence of water to 150 deg C. about 90 per cent of the water in the peat, which ordinarily cannot be separated by mechanical means, can be removed by moderate pressure By then applying a small amount of artificial heat a fuel free from water can be obtained.

Soaps for Removing Spots.

Many soaps sold as spot removers are ordinary cocoanut oil soaps, and remove only the spots which are prepared for the purpose by the vendor For example, spots made by daubing cotton goods with a mixture of tar and acid can be removed with pure water and completely disappear when washed with ordinary soap True spot removing soaps contain ox gall and turpentine which can be detected by their characteristic and powerful odors, even if the soaps are scented

A good spot removing soap may be made by mixing 20 parts by weight of good hard white soap in very small pieces with 8 parts of water and 12 parts of ox gall The mixture is allowed to stand over night and is then heated gently until solution is complete The heating is continued a little longer in order to evaporate some of the water and ½ part of oil of turpentine and ¼ part of benzine are stirred in after the vessel has been removed from the fire The still liquid soap is then colored with a little ultramarine green dissolved in ammonia, and is poured into molds which are at once covered

The following process is also recommended but it requires some care as the soap is easily separated by agitation, especially if the ox gall is not fresh In a vessel heated on a water bath 28 parts by weight of cocoanut oil are thoroughly incorporated with 5 parts of talc or fuller's earth 1/10 part of brilliant green and 1/50 part of ultramarine green The mixture is allowed to cool to 90 deg F 14 parts by weight of lye of a strength of 38 Baumé are then added and, after saponification is completed 5 parts of ox gall are stirred in If any separation takes place the vessel is closely covered and heated on the water bath until the mixture becomes uniform Finally ¼ part of turpentine and about 8 parts of benzine are added and the soap is poured into molds

Natural Synthesis.

In an address to the chemical congress recently held in London Prof Paterno of Rome called attention to the evolution which is taking place in the synthetical processes employed in the commercial production of organic chemical compounds There is a tendency to substitute for the crude tedious, and complex methods hitherto used processes of an entirely different character in which the desired chemical changes are effected at ordinary temperatures without the employment of violent reagents. As chemical science develops it allows an approximation to the ideally perfect methods of synthesis by which nature produces vast quantities of compounds in infinite variety Duclaux has wittily rallied those chemists of to-day whose ambition and efforts are wholly directed to the comparatively easy production of new compounds even if these compounds serve no other purpose than to enlarge dictionaries of chemistry Manufacturing chemists will assuredly discover and utilize new and more natural methods of synthesis The researches of the past half century in connection with ferments microbes toxines diastases catalyzers and the colloidal state of matter have indicated very interesting possible applications of these agencies to the processes of technology Some of these agencies have long been known Many kinds of fermentation for example have been utilized from time immemorial but the mechanism of their action was unknown Now that it is better understood it is safe to predict that the practical employment of that action in chemical synthesis will soon follow Very important applications of this newly acquired knowledge of biological chemistry have already been made Yeast which only converts sugar into alcohol and carbon dioxide has been to some extent, displaced by mold fungi which also convert starch into sugar Agricultural experiments have demonstrated the great fertilizing power of infinitesimal quantities of catalyzers, and a new and valuable method of saponification has been devised by Dr Nicloux

◆ ◆ ◆

Electrical illumination will be a great feature of the Hudson Fulton Celebration from September 25th to October 9th Over a million incandescent lamps 10 000 arc lamps, and searchlights aggregating 1 800 000 candle-power will be used in addition to the regular lighting of the city in New York alone not to mention the illumination of the Jersey shore and numerous special advertising signs.

RECENTLY PATENTED INVENTIONS.

Pertaining to Apparel.

GARMENT-RACK.—FANNIE WOLF, New York, N Y This invention relates to improvements in garment racks, and more particularly to the means employed for supporting the hangers and permitting of their rotation to expose the garment to view from all sides The invention involves features of construction substantially the same as certain of the modified forms illustrated in a prior application filed by F Wolf

Electrical Devices.

INSULATOR FOR THIRD RAILS.—L. STEINBERGER, New York N Y Among the many objects of this invention may be named the provision of means whereby a movable portion of the insulator may be connected with the rail and so arranged as to turn relatively to a stationary portion of the insulator the means for securing the insulator to a separate base, thus enabling the operator to handle the entire device as a single unit, and mechanism for taking up pounding action otherwise taking place between insulator and base owing to the alternate depression and rebounding of a cross tie when a train passes over it

CIRCUIT-CLOSER.—O M TURTISON Bainbridge Ind The main purpose here is to provide a closer which can be operated only by a special key and which therefore is not capable of being operated by any one other than the possessor of the key The actuating member is held securely in place while it is in use, thereby rendering it impossible for a separation of the circuit closing contacts

CONTROLLER.—H SMITH Suffern, N Y The more particular object of this inventor is to provide a type of controller in which there is a revoluble drum carrying resistance windings upon its periphery these windings being adapted to dip into a body of free mercury and being movable at will by aid of the drum for the purpose of varying the ohmic resistance of the windings.

Of Interest to Farmers.

STALK CUTTING ATTACHMENT FOR VEHICLES.—R. B. HUMAN, Chickasha Okla The cutting attachment is complete in itself in combination with cultivator disks, and which can be expeditiously applied to the forward or rear axles of an ordinary farm wagon, or to a similar vehicle and provide means for lowering and raising the cutter and cultivator disks

BEET PLOW.—L. BRENNKIN Oxnard Cal. An object of this inventor is to provide a plow with bell crank levers pivoted to the frame the levers having treadles on one set of terminals with a yoke pivoted to the frame the yoke having a pin which engages the draft bar to shift it.

Of General Interest.

ANIMAL-TRAP.—G J MILLER, Marco, Mont When the jaws are sprung, and the animal is caught beneath either one if not instantly killed or disabled, he naturally seeks to escape by crawling out under the jaw To prevent escape in this manner each end of the body of the trap is provided with a fang which will ordinarily pierce the skin or body of the animal when the trap is sprung which prevents his movement in any direction

DISAPPEARING TABLE.—G H WITTHAUS New York N Y This table is adapted for use in launches, yachts, apartments automobiles, and railway cars. One object of the invention is to provide means whereby a removable section of a floor may be utilized as a table reclining couch bench or a settee Articulated members support the floor section which may be received within a pit below the surface of the floor

Machines and Mechanical Devices.

FLYING MACHINE.—P V WADLEIGH Needles Cal The invention relates especially to machines of the aeroplane type The machine is provided with mechanism for raising the same to the desired elevation and having independently operated propellers for advancing the machine The invention resides in the construction of the lifting and propelling mechanism and in the guiding mechanism.

WELTING MACHINE.—J LARSEN Vestergade 11 Copenhagen Denmark The invention relates to means for handling welts in welting machines and in other forms of machines for sewing leather the more particular object being to provide means whereby the welt is fed step by step into a position favorable for enabling it to be pierced by the needle

VALVE.—A PALL, New York N Y The more particular object of this inventor is to produce an efficient type of valve suitable for use in connection with liquids or gases and especially adapted for handling illuminating gas. The invention comprises details of construction whereby the closure of the valve is rendered positive and the general efficiency of the valve is greatly increased

WIRE-FRAME MACHINE.—A PIARSE and H. COHN, New York, N Y One object of the invention is to provide a machine which is capable of a plurality of adjustments to permit frames of widely different forms to be fashioned thereon and which can be operated to release a frame after the latter is formed without destroying or altering the form of the frame.

SPEED-CONTROLLING DEVICE.—C E. PALMER, Spokane, Wash The device requires very little attention and is connected to a revolving part of the device to be controlled, with a view to cause the device to run at all times at a sure, steady, even speed, although the power or the load may increase or diminish instantly or gradually

FLYING MACHINE.—M B SELLERS, Baltimore, Md The weight of this machine is supported by the air impinging on one or more surfaces, inclined at a small angle of incidence and in motion relative to the air, whether this motion is produced by movement of air or by gravity or by propelled mechanism. When by gravity the machine is known as a gliding machine but it is equally suitable as a power-driven machine

CONCRETE-MIXER.—W D. CLOUGH, E. S. CLOUGH and J G CLOUGH, Quincy Ill The invention has reference to machinery for working concrete and the like the more particular purpose being to produce a concrete mixer especially adapted for continuously admixing concrete in successive charges of limited volume. The machine is to a great extent self-cleaning and is not liable to do any pounding

REGULATOR FOR THE FLOW AND LEVEL OF LIQUIDS.—P SUTHERLAND, La Luz, New Mex The invention is particularly useful in devices used in irrigating channels, mining ditches and other water supply conduits. It provides a regulator which is absolutely automatic in operation and which can be adjusted to operate and control the liquid body at different levels and at different rates of flow

LATHE HEAD.—G F FISHER, Torreon Mexico. More particularly the improvement relates to the means employed for driving the chuck or face plate at any one of a plurality of different speeds. The intention is to provide means whereby the ordinary belt-driven lathe having a cone pulley may be converted into an all gear lathe

ROAD-MACHINE.—M M SICKLER, Pala Cal The supporting wheels are operated by gearing particularly worm gearing instead of by chains, and the various supporting wheels can be independently operated for steering the machine and the bed may be raised or lowered, thereby achieving results on a hillside not ordinarily obtainable since the machine can be practically level upon a decided slope

COUPON CUTTER AND COUNTER.—F H BARTOW, New York N Y This device may be set to accommodate coupons of various sizes, and is adapted to sever or shear rapidly and evenly The device has a visible dial upon which is registered each coupon as cut, and by means of which all the coupons may be gathered as cut in a removable receptacle

TYPE-WRITER RIBBON SPOOL.—J F O'CONNOR New York N Y This improved typewriter ribbon spool is provided with a cast hub to which the flanges are riveted, thus permitting quick, convenient and accurate assembling of the parts without the aid of skilled labor and thereby reducing the cost of manufacturing to a minimum

Pertaining to Vehicles.

TIRE ARMOR.—W J BELYEA Port Huron Mich The invention relates particularly to improvements in a guard armor or protector for rubber tires of automobiles although it may be used on rubber tires of other vehicles, the object being to provide an armor that may be readily placed over a tire and absolutely protect the same from wear or abrasion, and also enable the use of a brake directly to the tread of the wheel

LOCK FOR CYCLES.—J M BARRETT Fostoria Ohio. The invention comprehends a lock mounted upon the framework of a bicycle and provided with a movable bolt adapted to project through the sprocket wheel the bolt being so arranged that when in its normal position the bicycle cannot be used the bolt being withdrawn from the sprocket wheel by aid of a key carried by the operator

TRANSMISSION APPARATUS.—J O FORBES New York, N Y The object of this inventor is to provide a mechanism whereby the rear or driving wheels of a motor vehicle can be placed thereon without in any way altering the motor vehicle and the power from the driving of such wheels will be applied to a power transmission member such as a belt pulley

LUGGAGE-CARRIER.—L. R. DRAPER, Santa Cruz, Cal One of the objects in this invention is to provide an adjustable luggage carrier adapted to be mounted on a vehicle, for carrying trunks bags, or other receptacles, secure against accidental displacement or loss, the carrier when not in use being adapted to be folded together

ARMORED TIRE.—S. T MOORE, Huntdale, N C. The improvement is in that class of tires which are armored and in which an air tube of the usual design is contained within the outer tube The aim is to provide a tire and means for protecting the air tube from puncture and also to provide means for preventing 'skidding' or slipping of the wheel and further to increase the traction and prolong the life of the tire.

NOTE.—Copies of any of these patents will be furnished by Munn & Co. for ten cents each. Please state the name of the patentee, title of the invention, and date of this paper.

NEW BOOKS, ETC.

TO AND FRO THE KEY TO LONDON. London Simpkin, Marshall, Hamilton, Kent & Co., 1909 12mo; pp. 243. Price, 6d.

Few people are aware of the many and valuable facilities of communication which await them in London, practically at their very doors, in the shape of the general public conveyances, and fewer still know how to completely avail themselves of these facilities so as to reach any part of the British metropolis with the greatest dispatch and comfort. The present volume is published with the object of enabling them to make full use of these advantages. Great strides have been made in the past year in effecting rapid transit in London and the guide before us enables the best advantage to be taken of the opportunities afforded. The work of compiling a book of this nature is colossal, and the publishers can be congratulated on the production of a unique book.

LIFE IN THE NAVY By Thomas Beyer Chicago Laird & Lee, 1909 16mo, 246 pp Price, 25 cents.

This book is published by special authority of the United States Navy Department, and is indorsed by ex President Roosevelt, Admiral Dewey, and Rear-Admiral Evans. It contains a vast fund of useful information which will prove of value to all who are in any way interested in the subject.

CATALOGUE OF A LOAN EXHIBITION OF RARE VIEWS OF OLD NEW YORK. New York Lloyd Title Insurance and Trust Company, 1909 12mo, 53 pages, illustrated

We are indebted to Mr J H Jordan the compiler for this excellent monograph on the prints which were exhibited a few months ago at 160 Broadway New York city The idea of the exhibition was a most novel one and the exhibition attracted wide attention. The quality of the prints was of the very highest, and many of them were practically unique The present volume is beautifully illustrated, and with a number of half tone engravings showing the prints *in situ* The book is beautifully printed on French deckle-edge paper, The present catalogue will be warmly welcomed by all collectors.

HOW TO COOK VEGETABLES By Olive Green New York G P Putnam's Sons, 1909 16mo, 644 pages. Price $1

No more unique or welcome aid to a brain fagged housewife can be imagined than this little series of handbooks in their plaid gingham covers, comprising such a large number of tried recipes. The book is beautifully printed on light-weight paper and it is really a delight to handle it. There are directions for cooking asparagus in 45 different ways, beans 95 ways, cabbage 106 ways celery 82 ways, chestnuts 19 ways, corn 87 ways, mushrooms 95 ways, although mushrooms are not really vegetable, but fungi. There are 20 ways of cooking the toothsome okra There are 336 ways to cook potatoes which is certainly a most remarkable showing There are 100 ways to cook tomatoes, and 40 different ways to cook turnips. There are besides dozens of formulæ for what might be termed minor vegetables. The other volumes of the series deal with 'What to Have for Breakfast" "Every Day Luncheons" "How to Cook Shell Fish ' and 'How to Cook Fish" The series is worthy of a large sale

THE EXPLORATION OF EGYPT AND THE OLD TESTAMENT By J Garrow Duncan, B D New York Fleming H Revell Company, 1909 12mo., 248 pages. Price, $1 50 net.

The present work is a summary of the results obtained by explorations in Egypt up to the present time with a full account of those bearing on the New Testament Many years of exploration in Egypt under the direction of Mr Flinders Petrie have abundantly qualified Dr Duncan to write on this interesting subject Many readers will feel grateful to him for explaining the processes of exploration. His general plan of writing is at once popular and accurate He speaks as an explorer on Joseph's granaries, the route of the Exodus, the treasure city of the Rameses and unearths many singular facts about them. The illustrations and drawings add a great deal to the vividness of the story, combining to give a book that has long been needed for the average reader

ITALIAN HIGHWAYS AND BY-WAYS FROM A MOTOR CAR. By Francis Miltoun. Boston L. C Page & Co., 1909 12mo., pp 380. Price, $3

A delightful book, sumptuously printed and appropriately bound. The author is in love with his Italy and makes a most entertaining book of it He has visited many of the out-of-the-way places with which the peninsula is filled The illustrations are particularly interesting and appropriate

THE GEOLOGY OF THE CITY OF NEW YORK. By L. P Gratacap. New York. Henry Holt & Co., 1909. 8vo.; 232 pages. Price, $2.50.

This is the third revised and enlarged edition, and is accompanied with 65 illustrations and 4 maps. There is no one better fitted to treat of this subject than Prof. Gratacap, whose long connection with the American Museum of Natural History has given him exceptional opportunities for the study of the available material at first hand. The book is excellently made, and is well illustrated by half tone engravings and diagrams. The facts presented and the statements have been brought together from many sources and have been classified. The book will certainly tend to develop and complete a correct geological conception of Greater New York. Mr. Gratacap is to be congratulated upon a highly successful scientific book.

GAS ENGINE THEORY AND DESIGN. By A. C. Mehrtens, M. E. New York John Wiley & Sons, 1909. 12mo.; pp. 256. Price, $2.50.

It has been the aim of the author to prepare a book for all who are interested in gas engines—students, draughtsmen, engineers, as well as the men who operate gas engines of any kind, and wish to become better acquainted with the theory and the why of many things. The book should be of special interest to the technical student, and was, in fact, first prepared for the engineering classes at the Michigan Agricultural College, since no suitable textbook could be found The reading matter throughout has been arranged carefully and with a definite object in view The large number of figures illustrating the text have been made as simple as possible It has also been the aim of the author to make the treatment clear and concise, and for this reason every paragraph should be studied—not merely read over

AN HISTORICAL REVIEW OF WATERWAYS AND CANAL CONSTRUCTION IN NEW YORK STATE. By Henry Whalen Hill, LL.D. Buffalo Buffalo Historical Society, 1908 8vo, 549 pages.

The present volume is a critical study dealing with various phases of the history of New York State waterways. Nothing of the character of the present work has been written before The book which is beautifully bound, is filled with papers and documents of all kinds. It is a most voluminous compendium of valuable facts which are particularly interesting at the present time when the subject of internal waterway construction in the Empire State is of paramount importance The Hon. Mr Hill is to be congratulated on the completion of so laborious a work

THE LURE OF THE LAND By Edith Loring Fullerton New York Long Island Railroad Company 1909. 8vo, 160 pages

The present attractive work is a history of a market garden and dairy plot which were developed within eight months upon a most unfertile section of Long Island The section was so bad that it was designated as "scrub oak waste' This work was carried on by the Long Island Railroad Company at Experiment Station No. 1 The author has also written a most valuable book entitled How To Make A Vegetable Garden Mr and Mrs. Fullerton are well known as promoters of agriculture along the latest scientific lines. The book contains a graphic description of the work from the time when the underbrush was cleared and the stumps dynamited until the farm was in its full fruition and they were shipping "home hampers" to the city containing an assortment of fresh vegetables picked before daylight and delivered before dinner The book is charmingly illustrated and describes the method of procedure which could be utilized in almost any territory Tables and figures prove that agriculture is far from being either a profitless or dry occupation with a celery crop at $330 to $1,000 per acre, Brussels sprouts at $500 asparagus at $355, gooseberries at $900 quinces at $1,500, and other attractive crops may be grown at similar profits.

INDEX OF INVENTIONS

For which Letters Patent of the

United States were Issued

for the Week Ending

August 3, 1909,

AND EACH BEARING THAT DATE

[See note at end of list about copies of these patents.]

Air governor, automatic L. W. Baker	[illegible]
Amalgamator R. [illegible]	[illegible]
Ammonia gas from ammonia liquors, obtaining purified C M Stine	[illegible]
Amusement apparatus, L. Collis	[illegible]
Anchor hook, guy clamp, and [illegible], O F [illegible]	[illegible]
Animal fat product and making same, J H Filbert	[illegible]
[illegible], R. W. [illegible]	[illegible]
Antirattling device, J. J. Halliday	[illegible]
Arch, fire brick, H. F. Stevens	[illegible]
Atomizer for paint or the like, R. [illegible]	[illegible]
Automatic switch and signal, H F Roach	[illegible]
Automobile lever lock, D. N [illegible]	[illegible]
Automobiles, gear changing mechanism for, F. [illegible]	[illegible]
Axle coupling, reversible car, M [illegible]	[illegible]
Back pedaling coaster brake, F A [illegible]	[illegible]
Bale identifying means, W. L. McCarty	[illegible]
Baling press, automatic, [illegible]	[illegible]
[illegible], O [illegible]	[illegible]
[illegible] making machine, D. Haynes	[illegible]
Bearing, W F [illegible]	[illegible]
Bearing, antifriction, H. [illegible]	[illegible]
Bed or box couch, H. J [illegible]	[illegible]
Bed spring, adjustable, [illegible]	[illegible]
Bell, selective ringing [illegible]	[illegible]
Bell for transmitting [illegible]	[illegible]
[illegible]	[illegible]
[illegible]	[illegible]
[illegible]	[illegible]
[illegible]	[illegible]
[illegible]	[illegible]

Legal Notices

60 YEARS' EXPERIENCE
PATENTS
TRADE MARKS
DESIGNS
COPYRIGHTS &c.

INVENTORS are invited to communicate with Munn & Co., 361 Broadway, New York, or 625 F Street, Washington, D. C., in regard to securing valid patent protection for their inventions. Trade-Marks and Copyrights registered. Design Patents and Foreign Patents secured.

A Free Opinion as to the probable patentability of an invention will be readily given to any inventor furnishing us with a model or sketch and a brief description of the device in question. All communications are strictly confidential. Our Hand-Book on Patents will be sent free on request.

Ours is the Oldest agency for securing patents; it was established over sixty years ago.

MUNN & CO., 361 Broadway, New York
Branch Office, 625 F St., Washington, D. C.

THEODORE ROOSEVELT'S

own and exclusive account of his

African Trip

begins in the **October** Number of

Scribner's Magazine

The start of the famous expedition—the wonderful railway journey through a country that was like a "great zoological garden," his meeting with Selous, the famous hunter of big game, descriptions of the black tribesmen of his caravan, his outfit, guns, tents, etc., etc. Most interesting observations upon the effects of the English, German, and other white settlements. The illustrations from photographs by Kermit Roosevelt and others.

These articles will run a year, and subscriptions should be sent at once to secure the full narrative.

Any person who can secure subscriptions can make money on Scribner's this year. Liberal cash commissions and cash prizes. Write NOW for particulars.

$3.00 a year. 25 cents a number

CHARLES SCRIBNER'S SONS, NEW YORK

The Scientific American Cyclopedia of Receipts Notes and Queries

REVISED EDITION

15,000 Receipts **734 Pages** **Price $5.00**

MAILED TO ANY PART OF THE WORLD

THE SCIENTIFIC AMERICAN CYCLOPEDIA OF RECEIPTS, NOTES AND QUERIES has had an unprecedented sale. It has been used by chemists, technologists, and those unfamiliar with the arts, with equal success, and has demonstrated that it is a book which is useful in the laboratory, factory or home. It consists of a careful compilation of the most useful receipts and information which have appeared in the SCIENTIFIC AMERICAN for more than half a century. Over 15,000 selected formulæ are here collected, nearly every branch of the useful arts being represented. Many of the principal substances and raw materials used in the arts are described, and almost every inquiry relating to formulæ will be found answered. It is more than a receipt book, as in most cases it gives all the standard and special formulæ, thus enabling the reader to find a receipt which fits his peculiar need. The alphabetical arrangement with abundant cross references makes it an easy work to consult. Those who are engaged in any branch of industry will find this book of the greatest practical value, and we especially commend it to those who are in search of an independent business, as they will find many formulæ for the manufacture of salable articles which will be worth many times the cost of the book. The Appendix contains the very latest formulæ as well as 41 tables of weights and measures, and a Dictionary of Chemical Synonyms.

Home-Made Experimental Apparatus

In addition to the following articles, the Scientific American Supplement has published innumerable papers of immense practical value, of which over 17,000 are listed in a carefully prepared catalogue, which will be sent free of charge to any address. Copies of the Scientific American Supplement cost 10 cents each.

If there is any scientific, mechanical or engineering subject on which special information is desired, some papers will be found in this catalogue, in which it is fully discussed by competent authority

A few of the many valuable articles on the making of experimental apparatus at home are given in the following list

ELECTRIC LIGHTING FOR AMATEURS. The article tells how a small and simple experimental installation can be set up at home. Scientific American Supplement 1551

AN ELECTRIC CHIME AND HOW IT MAY BE CONSTRUCTED AT HOME is described in Scientific American Supplement 1566.

THE CONSTRUCTION OF AN ELECTRIC THERMOSTAT is explained in Scientific American Supplement 1566.

HOW TO MAKE A 100-MILE WIRELESS TELEGRAPH OUTFIT is told by A Frederick Collins in Scientific American Supplement 1605

A SIMPLE TRANSFORMER FOR AMATEUR'S USE is so plainly described in Scientific American Supplement 1572 that anyone can make it

A ½-H. P ALTERNATING CURRENT DYNAMO Scientific American Supplement 1558.

THE CONSTRUCTION OF A SIMPLE PHOTOGRAPHIC AND MICRO-PHOTOGRAPHIC APPARATUS is simply explained in Scientific American Supplement 1574

A SIMPLE CAMERA-SHUTTER MADE OUT OF A PASTEBOARD BOX PINS AND A RUBBER BAND is the subject of an article in Scientific American Supplement 1578.

HOW TO MAKE AN AEROPLANE OR GLIDING MACHINE is explained in Scientific American Supplement 1582 with working drawings.

EXPERIMENTS WITH A LAMP CHIMNEY In this article it is shown how a lamp chimney may serve to indicate the pressure in the interior of a liquid to explain the meaning of capillary elevation and depression to serve as a hydraulic tourniquet an aspirator and intermittent siphon to demonstrate the use of liquids in exhaustive tubes to illustrate the phenomena of the bursting bladder and of the expansive force of gases. Scientific American Supplement 1583

HOW A TANGENT GALVANOMETER CAN BE USED FOR MAKING ELECTRICAL MEASUREMENTS is described in Scientific American Supplement 1584.

THE CONSTRUCTION OF AN INDEPENDENT INTERRUPTER Clear diagrams giving actual dimensions are published Scientific American Supplement 1615

AN EASILY MADE HIGH FREQUENCY APPARATUS WHICH CAN BE USED TO OBTAIN EITHER D'ARSONVAL OR OUDIN CURRENTS is described in Scientific American Supplement 1618. A plunge battery of six cells, a two inch spark induction coil a pair of one pint Leyden jars, and an inductance coil, and all the apparatus required, most of which can be made at home

SIMPLE WIRELESS TELEGRAPH SYSTEMS are described in Scientific American Supplements 1363 and 1381

THE LOCATION AND ERECTION OF A 100-MILE WIRELESS TELEGRAPH STATION is clearly explained with the help of diagrams, in Scientific American Supplement 1622

THE INSTALLATION AND ADJUSTMENT OF A 100-MILE WIRELESS TELEGRAPH OUTFIT illustrated with diagrams, Scientific American Supplement 1623

THE MAKING AND THE USING OF A WIRELESS TELEGRAPH TUNING DEVICE illustrated with diagrams, Scientific American Supplement 1624.

HOW TO MAKE A MAGIC LANTERN Scientific American Supplement 1546.

THE CONSTRUCTION OF AN EDDY KITE. Scientific American Supplement 1555

THE DEMAGNETIZATION OF A WATCH is thoroughly described in Scientific American Supplement 1561.

HOW A CALORIC OR HOT AIR ENGINE CAN BE MADE AT HOME is well explained with the help of illustrations, in Scientific American Supplement 1573.

THE MAKING OF A RHEOSTAT is outlined in Scientific American Supplement 1594.

Good articles on **SMALL WATER MOTORS** are contained in Scientific American Supplement 1494, 1649, and 1406.

HOW AN ELECTRIC OVEN CAN BE MADE is explained in Scientific American Supplement 1573

THE BUILDING OF A STORAGE BATTERY is described in Scientific American Supplement 1433.

A SEWING-MACHINE MOTOR OF SIMPLE DESIGN is described in Scientific American Supplement 1210.

A WHEATSTONE BRIDGE. Scientific American Supplement 1595.

Good articles on **INDUCTION COILS** are contained in Scientific American Supplements 1514, 1522, and 1527. Full details are given so that the coils can readily be made by anyone.

HOW TO MAKE A TELEPHONE is described in Scientific American Supplement 966.

A MODEL STEAM ENGINE is thoroughly described in Scientific American Supplement. 1527

HOW TO MAKE A THERMOSTAT is explained in Scientific American Supplements 1561 1566, and 1588.

ANEROID BAROMETERS, Scientific American Supplements 1500 and 1554.

A WATER BATH, Scientific American Supplement 1464.

A CHEAP LATHE UPON WHICH MUCH VALUABLE WORK CAN BE DONE forms the subject of an article contained in Scientific American Supplement 1562.

Each number of the Scientific American Supplement costs 10 cents by mail.

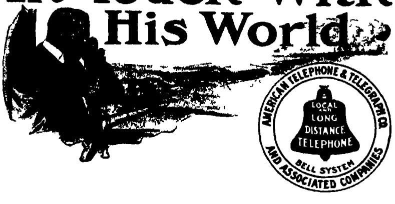
A printed copy of the specification and drawing of any patent in the foregoing list or any patent in print issued since 1863 will be furnished from this office for 10 cents provided the name and number of the patent desired and the date be given. Address Munn & Co. 361 Broadway New York.

Canadian patents may now be obtained by the inventors for any of the inventions named in the foregoing list. For terms and further particulars address Munn & Co., 361 Broadway, New York

In Touch With His World



He is in touch with his world

The railroad president to-day spends the greater portion of the summer at his country home renewing his energy He keeps in touch with his railroad system over the telephone

He may be one hundred miles or more away from headquarters, yet *his office* and the *principal business centers* of the country are *within talking distance.*

He is notified immediately when anything important occurs, his advice and direction are asked and given *over the telephone*, the machinery of the road goes on.

Each day, at the noon hour or in the early morning or late afternoon, he conducts his business over the long distance line.

Through the day he has been renewing his energy—sailing, driving, or playing golf—making himself *more fit for the busier season* and able at all times to handle a larger system and a larger volume of business than the president of two decades ago.

This is simply an illustration *which applies to every busy man*, whether he be railroad president, merchant, manufacturer or professional man

It shows the importance of universal service, which is the constant aim of the Associated Bell Companies—of *one system*, extending to every nook and corner of the United States, keeping *all* localities within speaking distance of one another

Long Distance Bell Service is universal in two ways—in its extension to all localities and in its application to all human activities. Whatever your interests, it will advance them economically, certainly, constantly

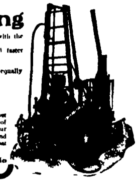
Big Money In Drilling



Our customers all over the Country are making from $25 to $75 profit a day with the Cyclone Drill. No business offers such large returns for the money invested.

Contractors, prospectors, well drillers find the Cyclone Drill more economical, faster and easier to operate than any other.

We make Hollow Rod, Cable and Core Drills to meet every need.

We also make combination machines that will handle any or all of the systems equally well, a machine that will enable you to cover the entire field of drilling.

Cyclone Drill

Our Diamondite and Steel Shot Core Drills cut faster and at a fraction of the cost of the old diamond drills. We sell Cyclone Drills on an [illegible] plan. Some of our customers have made more than the price of the machine within one month. Our new traction Gasoline machines [illegible] particular value where fuel and water are scarce. Send for our free books on Drilling and let us know in what branch of the work you are interested.

CYCLONE DRILL COMPANY 11 Main St Orrville, Ohio

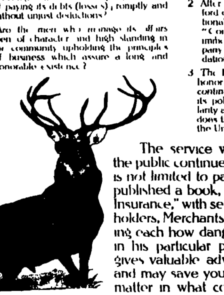
The Hartford Fire Insurance Company
and
The National Association of Credit Men

The National Association of Credit Men, representing the leading mercantile houses of the United States, in addressing merchants throughout the country on the need of adequate and responsible fire insurance protection, says

"Through the guarantee which it has given you an insurance company may suddenly become your debtor. Might it not be well to know ahead of time what kind of debtor it is likely to be?"

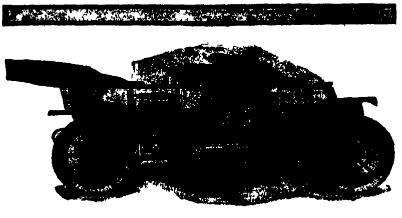
The points which the Credit Men say ought to be considered in selecting a fire insurance company are given below. See how well they describe the Hartford.

What Credit Men Ask	What the Hartford Is
1 "What is the net surplus above capital and all liabilities?"	1 The Hartford's surplus January 1st 1909, above capital and all liabilities—$5 061,592
2 Has it (the insurance company) a record of paying its debts (losses) promptly and without unjust deductions?	2 After San Francisco, in putting the Hartford on its **Roll of Honor,** this same National Association of Credit Men said, "Considering that its gross loss was the immense sum of $10,275 000 the company is worthy of the highest commendation."
3. Are the men who manage its affairs men of character and high standing in the community upholding the principles of business which assure a long and honorable existence?	3 The Hartford's reputation for commercial honor is its most cherished asset, and its continued observance of good faith with its policy holders is attested by its popularity and success. It is 99 years old and does the largest fire insurance business in the United States.



The service which the Hartford affords the public continues throughout the year and is not limited to payment of losses. It has published a book, "Fire Prevention and Fire Insurance," with separate chapters for Householders, Merchants and Manufacturers, showing each how danger of fire may be reduced in his particular property. The book also gives valuable advice concerning insurance and may save you thousands of dollars no matter in what company you are insured. It is free if you mention the *Scientific American.* Send for it.

The Hartford Fire Insurance Company
Hartford, Conn.



A Remarkable Car for $2,000

FOR the *first time* the automobile market offers you a car of *established reputation* at a price so near the price of cheap, untried cars that you cannot *afford* to 'economize'—you cannot afford to buy a car you will want to trade off in another year for a more satisfactory car.

Real economy—and perfect automobile satisfaction, for either the man who has never had a car or the man who has had many—is found in this big 1910 sensation—the new Haynes Model 19 for $2,000. No other automobile with reputation and character approaching this new Haynes Model has ever been sold at under $3,000.

It is the first time the manufacturer of an *acknowledged standard* automobile has ever offered the public a thoroughly high-class car *at anywhere near* the price asked for cars that are more or less of an experiment and that are *made to sell in big quantities.*

This new Haynes is for the man who is through experimenting (or who wants to avoid it) and who is ready to pay a moderate price for a car of *proven* quality.

It is built for the hundreds of conservative, long-headed buyers who want a car that they *know* will give perfect satisfaction—that will be an economical car to run—a simple car to handle—a car built to stand up under the usage that breaks down the *cheap* car—and a car that can be used *with pride* in the company of the *highest priced* automobiles.

HAYNES

Whether you buy this car or not, you owe to yourself to *investigate* it.

A Haynes at $2,000 is certainly too good a proposition to ignore if you are on the market for *any kind* of a car.

Mail coupon below and we will send booklet giving full details of this superb car, and will advise you where you can secure a demonstration.

Haynes Automobile Co.
124 Main St Kokomo Ind

Please forward literature concerning your Model 19 and advise where I can have a demonstration should I desire it.

Name

Address

Haynes Automobile Co.
124 Main Street Kokomo, Indiana

A necessity with Knee Drawers

No metal can touch you

A. Stein & Co 162 Center Ave. Chicago

10 DAYS FREE TRIAL

We will ship you a **"RANGER" BICYCLE** on approval, freight prepaid to any place in the United States *without a cent deposit in advance* and allow ten days free trial from the day you receive it. If it does not suit you in every way and is not all or more than we claim for it and a better bicycle than you can get anywhere else regardless of price or if for any reason whatever you do not wish to keep it, ship it back to us at our expense for freight and you will *not be out one cent.*

LOW FACTORY PRICES We sell the highest grade bicycles direct from factory to rider at **lower prices** than any other house. We save you $10 to $25 middlemen's profit on every bicycle—highest grade models with Puncture-Proof tires, Imported Roller chains, pedals, etc. at prices no higher than cheap mail order bicycles; also reliable medium grade models at **unheard of low prices.**

RIDER AGENTS WANTED in each town and district to ride and exhibit a sample 1910 Ranger Bicycle furnished by us. **You will be astonished** at the *wonderfully low prices* and the liberal propositions and special offers we will give on the first 1910 sample going to your town. **Write at once** for our *special offer.*

DO NOT BUY a bicycle or a pair of tires from *anyone at any price* until you receive our catalogue and learn our low prices and liberal terms. **BICYCLE DEALERS:** you can sell our bicycles under your own name plate at double our prices. Orders filled the day received.

SECOND HAND BICYCLES—a limited number taken in trade by our Chicago retail stores will be closed out at once, at **$3 to $8 each.** Descriptive bargain list mailed free.

TIRES, COASTER BRAKES, single wheels, inner tubes, lamps, cyclometers, parts, repairs and everything in the bicycle line at **half the usual prices.**

DO NOT WAIT but write today for our *Large Catalog* beautifully illustrated and containing a great fund of interesting matter and useful information. It only costs a postal to get everything. **Write it now.**

MEAD CYCLE COMPANY, Dept. L175, CHICAGO, ILL.

Chicago Beach Hotel

American Plan — Finest Hotel on the Great Lakes — European Plan

An ideal resort for rest or pleasure—ten minutes' ride from city, close to the famous Golf links and other attractions of the great South Park System. Has 450 large airy rooms, 250 private baths. There is the quiet of the lake, beach and shaded parks, or the gayety of boating, bathing, riding or driving, golf, tennis, dancing and good music. Table always the best. Nearly 1000 feet of broad veranda overlooking Lake Michigan. For handsomely illustrated booklet address Manager, 51st Blvd and Lake Shore, Chicago

The Editor is always glad to receive for examination illustrated articles on subjects of timely interest If the photographs are sharp the articles short and the facts authentic the contributions will receive special attention Accepted articles will be paid for at regular space rates

ANCHORING DOWN THE FLOOR OF THE GATUN LOCKS

The magnitude of the problems confronting the engineers who are building the huge locks at Panama by far the largest work of the kind yet attempted is shown by the nature of recent experiments which have been carried on at the site of the lock foundations The object of these experiments is to determine the best way to anchor down the floor of the locks and prevent it from being lifted bodily by the pressure of the water

Now to the average reader the statement that the floor of this huge concrete structure has to be anchored down to the mother rock below will come very much as a surprise for it has a uniform thickness of thirteen feet Moreover since the locks when in operation will be filled with not less than forty five feet of water one would imagine that the pressures on the floor would be altogether downward Yet as a matter of fact provision has to be made for maximum upward bending stresses upon the floor which will occur not when the locks are full but when they are unwatered for inspection This upward thrust might become so great that the weight of the thirteen foot thickness of concrete plus its own strength to resist bending and breaking stresses would not suffice to prevent its being thrust up from below and wrecked

Now since the floor of a single lock would weigh over one hundred thousand tons it can be understood that this upward pressure tending to burst in the floor when the lock is empty must be of enormous proportions The question will naturally be asked What is the character of a force which is capable of lifting up and breaking apart a mass of concrete one thousand feet long one hundred and ten feet wide and weighing one hundred and four thousand tons?

The answer is that water seeping through the surrounding ground and possibly following along the sides of the lock from the Gatun Lake and collecting below the floor of the lock might expose the latter when the lock was emptied to a hydraulic pressure equivalent to that exerted by a column of water eighty seven feet in height that being the vertical distance or head from the under side of the floor of the lock to the level of the water of the Gatun Lake Those of our readers who are familiar with the principles of hydraulics will understand that should such a seepage occur and a film of water gather beneath the lock when it was empty and should there be a clear connection between this film of water and the body of water in the lake a hydrostatic pressure acting vertically against the under side of the floor of the lock would be established

The engineers have guarded against such seepage of water by sinking a deep curtain wall through the ground beneath the entrance to the locks extending this wall down the full length of the locks against the outside wall and sinking it everywhere to the impervious underlying rock The possibility of seepage past this wall is very remote but such is the extraordinary care which has been taken to render the Panama Canal absolutely secure against disaster that it has been decided to consider the floor of the locks as liable to this seepage and this upward pressure and take special steps for anchoring the floor down to the rock below Experiments have been made to determine the effect of anchoring steel bars in the rock underlying the floor for the purpose of ascertaining to what extent they could be trusted to hold the floor down against upward pressure A number of old French steel rails were sunk in the rock to depths of from five to fifteen feet, and secured therein by concrete. In the test on a rail put down five feet, the rock began to crack under a pull of [illegible] pounds, and finally gave way under a pull of [illegible] pounds. The second rail anchored ten feet deep resisted all efforts to pull it up, the apparatus breaking under a pull of 237 750 pounds

The Board of Engineers having the investigation in hand found that the maximum thrust to be resisted above the intermediate gate sill is that due to eighty seven feet of water This thrust would occur in case the lock and forebay should be pumped dry for examination and a full head should develop under the entire area of the floor It has been decided that this can be resisted by a floor thirteen feet in thickness, anchored down to the rock below by rails spaced six feet apart over the whole floor of the lock, each rail having a resistance of 128 000 pounds The depth of the anchoring rails in the rock will be increased to fifteen feet in the middle part of the lock floor

FAR-SIGHTED POLICY OF IMPROVEMENT.

When the early railroads of the United States were projected the scarcity of capital made it necessary to build them on the cheapest possible plan In locating the new lines care was taken to interfere with the natural configuration of the ground as little as possible Deep cuts were avoided When the engineer encountered a bluff he located his line around instead of through the obstruction and if his survey was being made along the flanking hills of a tortuous valley he made the line conform closely to the configuration of the ground using many and sharp curves in the effort to avoid costly work of excavation with pick shovel and dynamite

Sharp curvature and steep grades, however, though they may secure for the railroad company a line that represents but little first cost involve a very heavy cost of operation The resistance of sharp curves and grades of two per cent and over limits the number of cars that the individual locomotive can pull To move a given tonnage of freight or number of passengers over a crooked and hilly road may call for two or even three times the number of locomotives and train hands that are necessary to haul the same traffic over a road that is fairly straight and reasonably level

As the years went by it began to be evident to the railroad companies that it would pay to spend a considerable sum of money in straightening out curves and reducing grades since the interest on the capital thus invested would be more than offset by the reduced expenses of operating the improved road Consequently the railroads as soon as their finances would permit began to eliminate the worst features of these hastily and cheaply constructed pioneer roads The work of revision has been carried on more or less steadily throughout the seventy five years that our railroad system has been in existence and during the past two decades the sums of money that have been spent in relocating and rebuilding the lines have been enormous The Union Pacific Railroad expended a few years ago between thirty and forty millions of dollars in cutting down grades and straightening the line on its Rocky Mountain division and more recently the Pennsylvania Railroad has laid out an even greater sum on its crossing over the Alleghany Mountains

The latest and in some respects the most striking enterprise of this character is a cut-off which is being made by the Delaware Lackawanna & Western Railroad by which it will shorten a forty mile stretch of its line between New York and Buffalo by eleven miles reducing the grades from sixty feet to the mile to a maximum of less than thirty feet and reducing the total length of the curves from thirteen miles to less than five miles Yet although the total length of the cut-off will be only twenty eight and one-half miles its construction will cost $13 000 000 which is equal to an average of about $450 000 per mile

The principal object of this cut-off is to enable the railroad to haul its heavy coal traffic by a short and easy route across the divide between the Delaware and the Passaic and Raritan rivers The present line runs to the south of a direct line making a detour of forty miles in which as mentioned above the grades reach sixty feet to the mile and there are over thirteen miles of curvature The new line extends from Lake Hopatcong north to Andover and to the Delaware River in an approximately straight line In order to eliminate curvature and grades it became necessary to make some of the deepest cuts and the loftiest and longest embankments in existence One cut through the solid granite is over one hundred and fifty feet deep at the point of greatest maximum depth and is over a half a mile in length Out of this cut alone must be blasted over half a million cubic yards of rock Beyond the cut is being built the greatest railroad fill in this country if not in the world It will be over three miles in length, and from seventy-five to one hundred and ten feet in height Into the embankment when it is completed, there will have entered over six and one-half million cubic yards of material [illegible] half times as much material as was [illegible] two huge excavations in New York [illegible] Pennsylvania and New York Terminal stations.

THE WRIGHT AEROPLANE INFRINGEMENT SUIT.

A suit in equity has been brought by Orville and Wilbur Wright against the Aeronautic Society of New York to prevent further exhibition and use of the Curtiss aeroplane owned by the Society, on the ground that the machine is an infringement of the Wright patents If the suit is brought to a final hearing, it will result in the first complete review of the state of aeroplane art in patent law, and will settle once and for all who should be legally acknowledged as the inventor of the balancing devices which are now employed in many aeroplanes.

Although we have not complete data before us, it is safe to say that the Wrights will undoubtedly base their chief claims for infringement on their method of warping the planes. Whether or not this method is new with them must, of course, be determined by a court To understand just what warping the wings means we must first understand something of the principles of an aeroplane's flight. An aeroplane may be defined as a surface propelled horizontally in such a manner that the resulting pressure of air from beneath prevents its falling Such a plane runs on the air like a skater over thin ice, to employ a simile invented by the late Prof Samuel P. Langley The most familiar example of an aeroplane is the kite of our boyhood We all remember how we kept it elevated even in a light breeze by running with it against the wind The cord may be regarded as the resultant of two forces acting at right angles—the one the pressure of the wind the other the weight of the kite Substitute the pull or the thrust of a propeller for the horizontal component (pressure) and an areoplane flying machine is created If this were all, the problem of artificial flight would have been solved long ago There remains the extremely difficult art of balancing the plane so that it will skate on an even keel Even birds find it hard to maintain this stability In the constant effort to steady himself, a hawk sways from side to side as he soars like an acrobat on a tight rope. Occasionally a bird will catch the wind on the top of a wing with the result that he will capsize and fall some distance before he recovers himself If the living aeroplanes of nature find the feat of balancing so difficult, it is no wonder that men have been killed in endeavoring to discover their secret

A sailing canoe in a stiff breeze affords a striking example of what this task of balancing an aeroplane really means As the pressure of the wind on the sail heels the canoe over, the canoeist must climb out on the outrigger, so that his weight will counterbalance the wind pressure and so that the moment of gravity will counterbalance the moment of air pressure. In a canoe the feat is comparatively easy, in an aeroplane it may demand constant and flashlike shifting of the body because of the incessant variations of the wind Otto Lilienthal a pioneer experimenter with the aeroplane, met a tragic death after he had succeeded in making over two thousand short flights in a gliding machine of his own invention, simply because he was not quick enough in so throwing his weight that the centers of air pressure and gravity coincided Pilcher an Englishman came to a similar violent end for a similar reason Octave Chanute in the United States continued the work of the ill-fated Lilienthal Realizing the inherent danger of a glider in which the operator must adapt himself to the changing center of air pressure with acrobatic agility Octave Chanute devised an apparatus in which the center of air pressure was mechanically controlled, so that there was no longer the perilous necessity of indulging in aerial gymnastics In his machine the tips of the planes, when struck by a gust of wind would fold slightly backward thus considerably curtailing the tendency of the center of air pressure to shift The Wright brothers warp the ends of the planes for the same purpose In his earlier machines Curtiss, instead of warping the ends of the planes, employed wing tips, which were moved up or down. The effect was the same In the new Curtiss machine acquired by the Aeronautic Society and involved in the present infringement suit no attempt whatever is made either to provide the main planes with movable tips or to warp them Instead, the balancing planes are carried between the main supporting planes These intermediate balancing planes are rotated about horizontal axes in order to balance the entire machine. The court will therefore be called upon to [illegible] whether or not these intermediate planes [illegible] entirely unconnected with the main supporting [illegible] are the mechanical equivalents of the Wright [illegible] ers' plane-warping devices. If they are, the [illegible] further have to pass upon the [illegible] nute's wing tips were an [illegible] brothers' plane-warping invention.

ENGINEERING.

The first National Conservation Congress of the United States will be held on August 26th, 27th, and 28th at the Alaska-Yukon-Pacific Exposition. Invitations have been sent to ten thousand prominent men in the States where conservation is receiving official attention. The Seattle congress will perfect a permanent organization, and will select representatives to attend the World's Conservation Congress at The Hague.

The squadron which Germany will send to the Hudson-Fulton Celebration will consist of Germany's latest armored cruiser, the 11,600-ton 22.5-knot "Gneisenau", the protected cruisers "Hertha" and "Victoria Louise" of 5,660 tons and 19 knots speed, the "Bremen" 3,250 tons and 22.3 knots, and the "Dresden," one of the new 3,600-ton fast scouts of which Germany is building so many, of 24.5 knots speed.

With the old Metropolitan line, 71 miles in length, and the Metropolitan District line, 28 miles in length, included, the network of London's subways and tubes has a total length of over 145 miles. London was the first city to inaugurate subway travel The Metropolitan line, which for many decades was operated by steam, was put in operation over half a century ago

In his testimony before the House Committee, Rear Admiral Mason recently estimated the life of an 8-inch gun at 200 rounds. As first constructed, the 12 inch gun began to deteriorate by erosion at 80 rounds, but by reducing the velocity and using a broader copper rifling band, its life has been extended to about 150 rounds. After 150 rounds it would be necessary to reline the gun at a cost of $12,000, which is about one-fourth the first cost of the gun

As one outcome of the experiments and conferences that have been held during the past three years between railway men and rail makers it was determined to seek the co-operation of the Bureau of Standards of the Department of Commerce and Labor Director Stratton has entered into hearty co-operation, and experiments looking to the improvement of steel rails will henceforth be made under the joint auspices of the maintenance of way engineers the managers of the rail mills, and the experts of the Bureau of Standards.

The navy collier "Nero," which went ashore on Brenton's Reef on July 2nd during a dense fog, was successfully floated by the Arbuckle compressed-air method. The deck was made airtight, and by means of powerful compressors the water was gradually expelled from the hull through the rents in the bottom When the ship had been sufficiently lightened, she was pulled from the rocks by the united efforts of tugs and salvage vessels.

There is now nearing completion a six foot steel main, which is being built to supplement the masonry conduit which carries the Brooklyn water supply from Nassau County It is twenty-three miles in length and will cost over $2,500 000 The present masonry conduit has a daily capacity of 120 000,000 gallons. The daily consumption of Brooklyn and Queens is 142,000,000 gallons, part of which is drawn from local artesian wells. The new steel main will have a capacity daily of 55,000,000 gallons.

That the illumination of New York city in connection with the Hudson-Fulton Celebration has been planned on a worthy scale is shown by the announcement that it will include 1,500,000 additional incandescent lights, 10,000 arc lights, and two batteries of searchlights, the total capacity of which independently of the city lights and private illumination will be 26 260,000 candle-power A dramatic feature will be the lighting of twenty immense signal fires upon mountain peaks along the Hudson from New York city to Newburg.

Everyone who admires the stately trees of the old New England towns—and who does not?—will be gratified to know that tree planting is being carried on systematically on the Massachusetts roads. The report of Mr E. W Breed, forester of the State Highway Commission, shows that during the year ending November 30th, 1908, 1,184 new trees were planted and 744 old trees were replaced. During the preceding five years, 12,112 trees had been distributed among fifty-five towns. The cost in 1908 of new trees averaged $1.29 each, and the average cost of maintenance was [illegible] cents per tree.

By the courtesy of the commandant of the Naval Training Station, the committee which have in charge the Portola Festival, commemorating the discovery of San Francisco Bay by Portola in 1769, have constructed on Yerba Buena Island, San Francisco Bay, what is probably the largest sign ever erected. The sign, which has been put on the sloping hills of the island, is [illegible] feet long by 125 feet high. The words "Portola Festival, October 19th-23rd," are arranged in two lines, each letter of which occupies a space 48 feet by [illegible], the strokes of the letters being 8 feet in width. [illegible] inches in [illegible] shows up [illegible].

ELECTRICITY

The eight-track swing bridges across the main channel of the Chicago drainage canal near 31st Street will be operated by electricity

An interesting article in the August number of the Fine Arts Journal describes the artistic possibilities of electricity both for decorative lighting and more utilitarian purposes of facile hospitality from electric toast racks to chafing dishes.

The electric railway up Mont Blanc is now open to the public as far as the Col de Voza, 5 495 feet high The first train took nearly an hour to accomplish the journey of 4¼ miles. There are no tunnels and the steepest grade is 20 per cent, some magnificent views of Alpine scenery being obtainable from the cars.

The Boston & Maine Railroad has bought the hydro-electric power plant at Eastman Falls on the Pemigewassett River, and concessions for undeveloped water power in the same neighborhood The company has large shops in the vicinity, and also operates trolley lines, for which this power will be available

With very little ostentation, the Commercial Cable Company has recently completed what will probably be a very valuable improvement, landing at Manhattan Beach the shore end of a new cable from St John's Newfoundland The new line is 1 300 miles long and is spliced to the transatlantic line 270 miles east of St. John's. It is expected to greatly accelerate transmission of messages from New York and southern points to Europe.

Few people would imagine that an electrical instrument factory requires a staff of expert jewelers, but the cutting in special forms, polishing setting and mounting of diamonds, sapphires, and rubies forms an important part of the work of the General Electric Company's meter factory at Lynn, Mass. Details of the operations involved are described in an interesting article by J G Baker in the current Electrical Review

The increasing use of electrical energy upon a large scale in industrial establishments renders necessary the adoption of numerous precautionary measures and it is to the credit of the great industrial corporations of this country that they not only recognize this fact, but employ special officials to give effect to the safety regulations adopted An admirable article on this subject by Mr R J Young safety inspector of the Illinois Steel Company appears in the Electrical World of August 12th

A fire alarm was recently sent to a station ten blocks from the scene of the fire by a route over 200 miles long. A car of coal caught fire at Edwardsville Ill the station of which has no telephone The station agent called Decatur, 100 miles away by telegraph where the dispatcher called Poag the nearest station to Edwardsville having a long-distance telephone The Poag operator rang up the Edwardsville exchange where the telephone operator rang the alarm in the fire station, and the engine was on its way only three minutes after the station agent reported the fire

Rio de Janeiro is one of the first capital cities of the world to be adequately supplied with hydro-generated electric power The current is transmitted at 88,000 volts from the generating station at a water power 51 miles away to a receiving station in the city, where it is stepped down by transformers to 6 300 volts, at which pressure it is supplied to the general feeders for lighting and power The general distribution is by means of four wire three-phase system giving 120 volts to lamps, etc between outside wires and neutral—the first time that this system has been tried upon so large a scale.

A patent was granted to Mr J H Cuntz on July 13th for a method of making wireless signals selectively audible by means of acoustic attachments A tuning fork is magnetically associated with a mechanical interrupter in the sending circuits, by means of which the high-frequency wireless telegraph current is interrupted throughout each signal at a rate corresponding to the pitch of the tuning fork An identical tuning fork magnetically associated with the receiving circuit gives forth an audible sound when the wireless signals are interrupted at a rate corresponding to its pitch, signals being heard only when the forks at both stations have equal pitches.

The great silver-mining district of Cobalt has been turning its attention to generation of power by water on account of the high cost of power due to the distance which fuel has to be conveyed The average cost of power hitherto has been $175 per horse-power year, some mines even paying as much as $400 A grant of land has been made at the head of Lake Temiskaming on the Matabichewan River, about 25 miles from Cobalt, where there is a large water power available, and a big hydro-electric power plant is being erected. The current will be conveyed to the mines, and either electricity for other power purposes or compressed air from electrically-driven compressors will be sold to consumers.

SCIENCE.

The municipal council of St Petersburg has decided to name the newly installed municipal laboratory after the celebrated Russian biologist Metchnikoff, who is at present connected with the Pasteur Institute of Paris. It will moreover found an annual prize of 1 000 rubles this to be known as the Metchnikoff Prize and it is to be awarded for the best work in biology

In a recent lecture before the Society of Arts Eyde gave some details concerning the present condition of the manufacture of artificial nitrates at Notodden, where large quantities of calcium nitrates are produced and sold in competition with nitrates from Chile. The annual production of nitrate of soda in Chile is 1 800 000 tons In 1920 this may be expected to be increased to at least 2 500 000 tons At the same epoch the Norwegian production will amount to about 300 000 tons or only 12 per cent of the Chilean Meanwhile of course other factories may be established which will largely increase the total production of artificial nitrates Nevertheless Eyde does not fear competition in view of the constant increase in demand throughout the world From experiments made in various countries it may be concluded that artificial nitrate is as good a fertilizer as Chile saltpeter and on some lands a better one

The age of a fish can be determined with accuracy by inspection of the otoliths or bony concretions which are found in the auditory apparatus These otoliths increase in size during the entire life of the fish each year adding two layers a light-colored one formed in summer and a dark one formed in autumn and winter The alternate layers are sharply contrasted and very distinct so that there is no difficulty in counting them The number of pairs of layers is equal to the number of years the fish has lived By this method Wallace has made an interesting study of the distribution of fishes of the plaice species over various sea bottoms according to age In this way the rapidity of growth of fishes and the effect of fisheries on the population of the sea can be determined

The new German exchange professor for Columbia University is Dr Karl Runge of Gottingen Germany Prof Runge was born at Bremen in 1856 studied at Munich and Berlin receiving the degree of doctor of philosophy at the latter institution in 1880 Before his appointment at Gottingen he was professor in the Technical High School at Hanover He has an excellent command of English Dr Runge's first original work was in pure mathematics and he early obtained a high position among German mathematicians Of later years his interest has been more largely in applied mathematics He has, for instance made important investigations in spectrum analysis and in astronomical and nautical researches His most recent specialty and one upon which he will give a course at Columbia is the study of graphical methods in physical and technological research

By using the soundings shown on the Admiralty charts Prof Edward Hull has demonstrated that a series of isobathic contours can be drawn showing the form of the ocean bed In this way we can determine the margin of the continental shelf which breaks off into deep water near the 100 fathom contour, as also the channels of the submerged river valleys which traverse it down to depths of about 1 000 fathoms By this means those of the English Channel River and those of the Loire the Gironde and the Adour off the coast of France also those of the Caneira Arosa, Lima, Douro Mondego and Tagus from off the coast of Spain and Portugal have been determined The existence of these channels, formed by erosion under land conditions indicates great changes of level in late Tertiary times resulting in the climate of the 'Glacial period"

The existence of a rich fauna in the sea proves that the salts contained in potash wastes if sufficiently diluted are not injurious to fish Nevertheless it has frequently been observed that if strong saline solutions are discharged into streams, the salt is distributed throughout the water very slowly In some cases a strong saline current, sharply distinguished from the rest of the stream, persists for several miles, and may destroy either the fish or the organisms upon which they feed Chemical purification of the waste waters of the potash manufacture has been attempted In the Mehner methods the waste water which contains a large percentage of magnesium chloride is mixed with lime which precipitates the magnesia in the form known as Sorel cement This mass, mixed before setting with inert substances may be used for filling the voids caused by the extraction of the potash salts, or solutions of magnesium chloride may be concentrated to a strength of four molecules of water in which condition the salt takes up two additional molecules of water and may therefore, be used in dehydrating additional quantities of solution thus producing a pasty mass which is convenient for the filling of voids.

REPAIRING THE CRUSHED-IN BOW OF THE "FLORIDA"

The extraordinary photograph reproduced on the front page of the present issue shows the result of one of the most tremendous collisions in the history of ocean navigation. That concertina-like mass of crumpled-up steel plating and framing represents the effect of the blow struck by a steamer weighing seven thousand tons and moving through the water probably at not less than twelve knots an hour, when it crashed squarely into the side of an even huger vessel weighing about twenty-five thousand tons and itself moving at a speed somewhat less. The energy of the blow struck by the "Florida" was not expended until thirty feet of her bow had been crushed and jammed tightly together into a space of five feet. But with this dramatic picture before us telling its own unmistakable story, it is needless to multiply words by way of description.

It was during thick weather on January 23rd, 1909, that the steamship "Republic" of the White Star Line was feeling her way past Nantucket lightship, when suddenly out of the fog loomed up the bow of the "Florida," so closely aboard that nothing could be done to avert the collision. The blow was delivered squarely amidships. The "Florida's" bow crushed through the side plating of the "Republic" and entered the engine room, tearing open a gaping vertical hole which extended from the main deck down to the bilge. The subsequent history of the disaster, including the call for help by wireless and the speedy rescue of the passengers of the "Republic," needs no repetition here. The gradual giving way of the bulkheads of the stricken ship sealed her fate, and she now lies in some four hundred feet of water. Thanks to the staunchness of the construction of her collision bulkhead, the "Florida," although thirty feet of her bow had been smashed in, was able to make her way to New York under her own steam.

To those who went down to the Bush docks in South Brooklyn to take a look at the "Florida," it seemed as though the terrific impact of the collision must have strained the ship so severely as to necessitate many months of careful overhauling and repair. Several weeks elapsed indeed before the owners made any call for tenders for the work of repair, which involved the construction of an entirely new bow on the vessel. The contract was let to the Morse Dry Dock and Repair Company, who agreed to cut away the old wreckage and build a completely new bow in the extraordinarily short time of twenty-four running days and for the sum of $39,[illegible]00. The nearest competitor asked for thirty-four days, while one contractor considered that to complete a job of this magnitude would require fifty-six days, or two and one-third as much time as that in which the job was actually done.

It has been a matter of common belief on the part of the public that American shipyards are unable to turn out work at the speed which obtains in foreign yards. There was a day when this may have been true, but with the increased experience, the better tools and the splendid plants which have been built of late years around our seaboard and on the Great Lakes, the art of shipbuilding has made prodigious strides. It is safe to say that work can be turned out of as high quality and in as short a time in the best of our yards to-day as it can in those of the European shipbuilders, and of this fact the remarkable job done on the "Florida" affords strong evidence.

The "Florida" with her new bow completed, 24 days after repairs were commenced

Immediately upon the awarding of the contract, workmen armed with pneumatic tools cut through the plating and the decks from the rail down to the waterline, the general line of cutting being about two feet aft of the farthest point of damage. Telephone and telegraph were meanwhile busily at work, and while the wreck of the bow was being cut off, the mills were furnishing the new steel frames and plating, and a new steel stem piece was being cast by the New Jersey Steel Company in New Jersey. The contract time for the latter was six days; but the patterns for the stem piece and the steel casting itself were made, and the latter delivered at the Morse yard, in three and a half days time. In five days after beginning repairs the "Florida" was placed in drydock, stern first, and at one o'clock the workmen were cutting through the remaining portion of the hull from the waterline down to the keel. The 800-ton floating derrick "Monarch" was now brought to the open end of the floating dock. Chains were shackled onto the broken bow; and at a quarter past six the same evening the shapeless mass, weighing about one hundred tons, was lifted from the ship. It was subsequently sold as junk for seventy-five dollars.

The next step was to lower the floating dock, float the ship out, turn her around, and float her back into the dock, so that the bow would be near the workshops and convenient for the transport of material. The new stem was immediately placed in position, the new frames erected, the riveting of the plating begun, and so quickly did the work proceed that thirteen days after the lifting off of the old bow the ship was floated out of the dock with the plating in place, riveted, and painted to some distance above the waterline. Less than two weeks later the job as specified by the contract was completed with the decks, rooms and all fittings in position. It was done within the contract time of twenty-four days, with a margin of a few hours to spare.

Before closing, reference should be made to the curious fact, as shown by the photograph, that the forecastle deck was not crushed together like the body of the bow below. Evidently at the time of collision the top deck of the "Florida" stood a few feet higher above the water than the top of the side plating of the "Republic", and, as the ship crushed into the "Republic" her forecastle deck must have reached out intact above the main deck of the "Republic." When the two ships tore apart, the thirty feet of projecting deck of the "Florida" broke and bent over with its own weight and hung down in the position shown in the engraving. Our thanks are due to Mr. E. P. Morse, general manager of the Dry Dock Company, for photographs and data used in the preparation of the present article.

View looking forward, showing after side of the chain-locker bulkhead. This section, representing 30 feet of the bow and weighing [illegible], was crushed into a mass 5 feet in thickness.

Wrecked bow lifted away from the ship by floating derrick

REPAIRING THE CRUSHED-IN BOW OF THE "FLORIDA."

◆ ◆ ◆

In the early part of the present year the French Academy of Sciences discussed a communication in which it was asserted that the human body emits radiations which affect photographic plates. In the course of the discussion De Fontenay demonstrated that the effects which had been attributed to radiations could be explained perfectly by the warmth and moisture of the body. Later an attempt was made to sustain the theory of human radiations by the statement that the Lumière company had been compelled to discharge several employees who fogged the plates that passed through their hands. De Fontenay investigated the matter and found that nothing of the kind had ever occurred at the Lumière factory. Each case of fog was due to accident and to well-known causes—finger-marks, packing strips, pattern fog, etc.—not to any mysterious human radiation. In regard to [illegible] magnetism and other occult agencies, it [illegible] enough to be [illegible] crude experiments [illegible]

THE EDISON CONCRETE HOUSE

Although Mr. Edison has left his mark upon more different developments of the world's progress than perhaps any other living scientist, and is now past the age at which the majority are most productive, he is now giving most of his time to an invention which he himself considers the greatest thing he has ever done.

The name of Edison is associated in the popular mind principally with electricity, the wide range of the inventor's improvements in telegraphy, telephony, and lighting being principally concerned with ingenious cajoling of that mysterious fluid, but his present work is as far removed from delicate electrical devices as monolithic masonry Even more widely known than his electrical devices are Mr Edison's inventions of which the principal use is the amusement of the people, the phonograph and the kinetoscope, the former of which, considered by itself apart from its commercial or industrial value, remains perhaps the most wonderful machine of all, but Mr Edison now goes on from the amusement and recreation of the masses to the amelioration of their material surroundings, and thereby to increasing their self respect. This, as Mr Edison says is surely worth doing, and in its intended effect in the betterment of mankind is truly more a philanthropic than a commercial undertaking.

Specimen mural decoration cast in concrete.

Mold from which it is cast.

The ultimate object of the present invention is no less than the provision of a means whereby individual workingmen's homes—artistic, comfortable, sanitary, and not monotonously uniform—may be turned out in such quantity and so cheaply that their rent, including car fare to and from the tenant's work, will not exceed, say nine dollars a month. Mr Edison hopes thereby to depopulate the swarming tenements of congested cities, and provide their occupants with surroundings morally, mentally, and physically more healthful

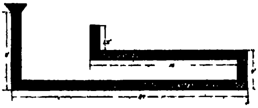
Reinforced concrete is the material adopted, and by Mr Edison's method, after the erection of suitable molds, an entire house, including walls, floors roof, molding, cornices, bath and laundry tubs, is "poured" at one operation, much as one might squeeze paint out of a compressible tube and leave it to set.

Rumors of this intention have been in the air for some time, and have been received with more or less incredulity or derision by the technical press, but experiments upon a practical scale have now reached a stage of progress at which Mr Edison is confident of ultimate success, and permits the present authentic description

Mr Edison's first intention was to build a two-family house, and considerable work was done in preparation of the molds, but the designs submitted by architects he had employed did not prove adaptable to the system, and it was found that there was a growing demand for single houses. Mr Edison therefore set his own engineers, Messrs. H J Harms and G. E. Small, to work exclusively upon the development of the concrete house plans, with the result that under their direction an extraordinarily adaptable set of molds has been produced

The completed "form" for a single house may require as many as five hundred different sectional molds of cast iron bolted together, but the latter are so designed that a dozen houses in a row may be built on the same cellar plan, the first floor molds being disposable in several different ways, and the second floor molds likewise, so that no two houses of the dozen need be alike, thus avoiding monotonous uniformity of appearance

The typical house shown in our illustration has a floor plan 25 x 30 feet, intended to be built on lots 40 x 60 The front porch is 8 feet and the back 3 feet wide On the first floor is a living room 14 x 23 x 9½ feet high, and a kitchen 14 x 20 x 9½ at the back From the corner of the living room a staircase leads to the second floor containing two roomy bedrooms and a bathroom 7½ x 7½ x 8 feet. The third floor contains two large low attic rooms but each room has large windows, providing an abundance of light and fresh air A cellar 7½ feet high extends under the whole house, containing boiler, wash tubs coal bins etc.



Result of test of gravity flow of concrete

All the moldings and decorations are cast in the concrete, and not *appliqué* as hitherto in concrete work Our illustration shows a typical piece of decoration with the mold from which it was cast, such decoration molds being of course, changeable with each of a row of houses built

The inside walls require no plaster finish the special mixture used leaving a perfectly smooth surface, which can be tinted as desired Only the doors and window frames and the pipes for water, gas, or electric light wires are of wood or metal making the house not only water-proof and vermin proof, but practically fire-proof, reducing if not eliminating insurance cost.

The foundation and cellar floor should be laid some days before the weight of the molds is put upon them The latter are then assembled complete from cellar to roof, and the special concrete is conveyed from large mixers into a distributing tank at the top of the house whence it flows to every nook and crevice of the molds by gravity until the form is full and the concrete overflows at the top.

The mixture used is much more liquid than usual concrete, in order to obtain free flow, in spite of which there is no segregation of the material or settlement of the heavier aggregate One of our illustrations shows a wooden form or conduit of only 4 inches square section which has been completely filled with concrete poured only a bucketful at a time into the highest end The concrete flowed down 8 feet, horizontally 24 feet up 4 feet horizontally again 16 feet and then up over 2 feet to within a foot of where it entered entirely by gravity and on the board at one side of the form being removed when the concrete had set showed almost perfect uniformity of the material This is a much more extreme test of fluidity than the material would be subjected to in the pouring of a house from the top This result is obtained by the mixture with the concrete of a special colloid, which for the present is Mr Edison's secret

The latter thinks it will be possible to assemble the molds complete in four days to fill the form with concrete in six hours and after allowing six days for setting to remove the molds in another four days. A complete set of molds would therefore be occupied for fourteen days in the building of one house or would be available for about 21 houses in a year, but owing to the interchangeability of parts Mr Edison estimates that with six complete sets of molds 144 houses may be built in a year

The greatest care is taken to make all the mold sections interchangeable a special machine having been designed to plane them uniformly and all bolt holes in their flanges being drilled to templet Such are the finish of the molds and the nature of the colloid concrete that there is absolutely no adherence of the latter to the former The marks of the joints between the molds are rarely traceable on the finished wall and the molds may be used over and over again indefinitely With the present use of wood for forms it is almost impossible to use the latter over again owing to breakage and adhesion and it is cost of the wood that renders the expense of monolithic concrete dwellings prohibitive.

Assembling the cast-iron molds of the "form."

[illegible]

Typical house cast in one piece.

THE EDISON CONCRETE HOUSE

Another great cause served by Mr Edison's system is therefore that of conservation of natural resources, any extensive use of concrete with wood forms causing an actual waste of wood, and materially assisting the much talked-of depletion of forest reserves.

One complete set of molds will cost about $25,000, and the accessory machinery for mixing conveying, etc another $15 000 so that a large capital will be required to build houses in this way but this Mr Edison considers an advantage taking home building out of the hands of irresponsible jerry" builders looking only toward the quick sale or rental of a house.

Mr Edison thinks that the cost of such a house as that described will be about $1,200 including materials, labor interest on plant, complete ready for occupancy with plumbing heating and lighting fittings This prime cost not merely makes low rentals possible but places the ownership of a home, at least upon the instalment plan within the reach of any thrifty workman

The Alteration of the Colors of Flowers by Cultivation.

BY PROF F HILDEBRAND.

In general all the flowers of the same species, in the wild state have the same color For example, all plants of crowfoot or buttercup and dandelion have yellow flowers. In a few species different colors are found For example the flowers of the milkwort (*Polygala vulgaris*) may be blue, violet red or white Much greater variation is shown by cultivated plants. In these the variation of color of the flowers appeared long ago but in recent years many new colors have been produced which had either not hitherto been observed or which if they did appear occasionally, were not selected for preservation and development The floriculturists of the present day carefully observe and endeavor to fix every new shade even if it is not particularly beautiful, for the desideratum is novelty, and there is no telling what will please the popular taste. But in these attempts to obtain new colors in flowers, the propagator is entirely dependent upon the innate predisposition of the particular species with which he is working He can by no means obtain every desired color In the following sketch will be mentioned first a few cases of species in which a color has been obtained which was formerly considered impossible Some other examples will be adduced to show that in certain species a great many new colors and shades but not all colors have been obtained Finally a few other cases will be quoted in which the flowers of a species have shown little or no variation in color during many years of cultivation

A species of primrose (*Primula acaulis*) in the wild state always has lemon yellow flowers which vary only slightly in tint Cultivation has produced both lighter and darker shades but until recently no color but yellow Hence it was the more surprising when a few years ago a pure blue variety was produced, which has since retained its general color but has developed all shades from the palest sky blue to the deep blue of the corn flower The Chinese primrose (*Primula sinensis*) when cultivated in the garden bore until recently only red and white flowers. In this species also other colors have lately been produced, not only violet but also blue though not so pure a blue as that of the species first mentioned Another example is offered by the gladiolus which formerly bore only white and red flowers but has recently developed a blue-flowering variety A case of a somewhat different character is presented by the asters, which have long shown a great variety of colors but in which recently a great many new shades have been produced including some which would not at one time have been considered beautiful, for example copper-color

Very numerous on the other hand are the species which have long shown great variation in color and have recently developed many new shades, with the exception of blue Especially conspicuous in this connection is the dahlia which is now found in every color except blue although many propagators are making earnest efforts to produce a blue dahlia, which would bring great profit to its originator A blue carnation would be equally valuable but it has not yet been produced although the colors of carnations have lately been enriched by many new shades. The new varieties of canna also show great diversity of color including almost pure white and a beautiful light pink but a blue canna has not yet appeared In the begonia not only blue is lacking but also all shades from red to violet Finally, we may mention the variety of poppy called the Shirley which is greatly admired for its play of color Here, however the colors range only from white to rose and vermilion Blue and violet colors are completely wanting and so is yellow which is very common in the begonia.

Other species which have recently produced many new tones, with the exception of blue, include: Pelargonium, Scabiosa, Calceolaria, Antirrhinum Mirabilis Jalapa (Four O'clock or Marvel of Peru), hollyhocks, immortelles, and some species of Phlox and Godetia. The Gilliflowers, Wallflowers, and Balsams belong in the same category, for the varieties of these three flowers which are described as blue in seedsmen's catalogues are not pure blue, but violet.

It should be observed, furthermore, that among species which have produced many new colors, there are some in which the color yellow is wanting. This is the case with some species of larkspur (*Delphinium ajacis* and *D consolida*), with *Dianthus Heddewigii* and with the verbenas and Clarkias.

Finally, there are species which, notwithstanding many years of cultivation, have shown little variation in the color of their flowers or have produced only new shades but not new colors. Among these are the fuchsias, which show only various shades of red A blue or a yellow fuchsia would be a curiosity An other example is furnished by *Cyclamen persicum*, in which many years of cultivation have only changed the original color scheme of a dark red throat and a white or pink tip so far as to deepen the red throat to crimson and almost to violet and, on the other hand, to efface it altogether, producing a pure white flower Quite recently, however, an approximation to a yellow has been obtained by the production of a salmon-pink cyclamen. Similar cases are furnished by the Alpine forget-me-not in which merely the shade of the original blue color has been slightly altered by cultivation, and by the marigold (*Tagetes*), the colors of which vary only from yellow and orange to brown

From the foregoing remarks it is evident that, although very many new colors have recently been produced by cultivation in the flowers of numerous species of plants, the production of these changes is entirely dependent upon the original predisposition to variation possessed by the plant. Without these tendencies to variation, no new color can be produced, either by the gardener or by natural selection, for if there is no variation, selection is impossible—Translated for the SCIENTIFIC AMERICAN from Umschau

Decreased Number of British Patent Applications During the Past Year.

Consul Albert Halstead, of Birmingham, reports as follows concerning applications for patents in the United Kingdom in 1908

According to the report of the Comptroller-General of Patents, patent applications in the United Kingdom in 1908 numbered 28 598, a decrease of 420 from 1907 of the total 572 were from women and 1 459 from abroad the United States furnishing 572 of that total and Germany coming second with 515

The greatest number of applications made in 1908 were in connection with locomotion which, the Comptroller says was due to the continued interest in motor cars and allied subjects A great though smaller activity was shown in connection with wheels, efforts being chiefly directed toward the provision of an easily detachable tire-carrying rim, while many applications dealt with valves for internal-combustion engines Inventions relating to road tarring machines, compositions for treating the surfaces of roads, and dust-collector fittings for motor cars to abate the dust nuisance showed increased interest as did tools for the repair of automobiles on journeys On the contrary, there was some neglect of horse-drawn and railway vehicles.

Many inventors occupied themselves with flying machines of the heavier-than-air type especially in regard to their automatic balancing and facilities for manipulating the various rudders and planes. Again patents in connection with the manufacture of artificial silk showed an increased activity in an industry which the Comptroller reports to be developing It may be said that artificial silk manufactured by a new patent process is one of the new shipments from Birmingham to the United States, and apparently a growing one

The subjects of short-base range finders and eyes, periscopes for submarine boats, automatic railway signals, and systems for giving signals in the locomotive cab, as well as a controlling apparatus for stopping trains which have reached an excessive speed, were in evidence in patent applications. Processes for the regeneration of waste rubber and the synthetic production of rubber or rubber-like products formed an interesting feature of the patents of last year. New methods of using tungsten and other refractory metals for manufacture, by working them in combination with ductile metals which are afterward removed by heating the finished article, also attracted attention, while the stropping of flexible razor blades is an indication of the way in which the idea of a safety razor, since its development in the United States, has been developed abroad

Under a section of the patent and designs act of 1907 providing for the revocation of patents worked exclusively or mainly outside the United Kingdom, several patents have been revoked This section of the British patent law is one that American manufacturers can not neglect without serious danger to their patent rights in the United Kingdom.

Out of the total number of patents sealed—[illegible]—in 1908, the following numbers were [illegible] to residents in foreign countries: [illegible] Germany, 2,515; France, [illegible]; Austria-Hungary, [illegible]; Switzerland, 2[illegible]; Australia, 10[illegible]; Belgium, [illegible]; Canada, 15[illegible]; Sweden, 2[illegible]; Italy, 134

Liquid Alloys of Sodium and Potassium.

Jaubert has obtained liquid alloys of sodium and potassium by treating sodium hydrate with metallic potassium, and potassium hydrate with metallic sodium. In both cases liquid alloys are formed, corresponding closely to the compounds NaK and NaK$_2$. The last-named alloy contains about 80 per cent of potassium.

As 23 parts of metallic sodium, which is comparatively cheap, set free 39 parts of the much more valuable potassium, this reaction may be made the basis of a practical method of producing potassium, in the form of a rich alloy

Air must be excluded during the operation, but if this is conducted under melted commercial paraffine, the temperature cannot be raised above 400 deg. F., and the yield of alloy is diminished by reactions with the impurities of the paraffine. In the laboratory it is preferable to operate in a vacuum, the metal and alkali being placed in a strong retort of Jena glass, which is connected with an air pump and heated by an oil bath. 12 parts of potassium and 4 parts of pure and perfectly dry caustic soda yield the alloy NaK$_2$. The same alloy is produced when 7 4 parts of sodium are mixed with 16 parts of caustic potash containing 10 per cent of moisture, and the mixture is heated to 437 deg. F, while 5 5 parts of sodium added to 6 parts of potash and heated to 662 deg F yield the alloy NaK. The alloy NaK$_2$ is made on a larger scale at Clavaux, France, in iron retorts, provided with stirring apparatus. The product contains 77 per cent of potassium.

The Current Supplement.

The practical method of aerial photography has long been sought. Very successful results have been obtained in experiments with kites, which were recently made on French naval vessels by a system designed by Capt. Saconney In the opening article of the current SUPPLEMENT, No. 1756, this system is described The rapid advance of theoretical science in general, and of theoretical electricity in particular, is nearly as bewildering to the physicist and chemist, who is not investigating electrons and ions, as it is to the engineer The old notions, we are told, are not wrong, but they must be modified in the light of recent research A general exposition of the problem of the conduction of electricity will therefore be welcomed Such an exposition (a cautious guide and not an immature theory) is given by Prof. J Koenigsberger Mr E. F Lake's admirable discussion on the Oxhydric Process of Cutting Metals is concluded. Interesting in the light of the recent introduction of tantalum and tungsten for lamps is Dr C Richard Boehm's article "The Forerunners of the Metallic Filament Incandescent Lamp" Maria Parloa's treatise on Canning and Preserving Fruit is concluded. Recent discoveries have filled up to a great extent the gaps in our knowledge of Palæolithic man. A general review of the present status of the subject is given by A C Haddon Atmospheric circulation is discussed by R. F Stupart. The first of a series of articles on Imitation Arms and Armor and how they are made is presented. Arthur Watson writes entertainingly on Conjurers of the Past, and delves up many a bit of historical magical lore. Experiments have lately been made by M. Blum with a simple apparatus designed to demonstrate the rotation of the earth on the plane of oscillation and support of a simple pendulum. The experiments are summarised by J J Davis and H. F. Purday

Ancient Records of Halley's Comet.

Andrew C. D. Crommelin in an article on "The Expected Return of Halley's Comet" in Science Progress (London) gives an interesting account of the early observations of this comet which appears at intervals of about 75 years. The first definite record of this comet is from China where it was observed and fully described in 12 B. C. The various appearances from this time up to that of 1378 were more fully and accurately described in China than in Europe. Its path through the constellations was described in the Chinese records because they "imagined that the terrestrial kingdoms had their counterparts in the sky, and that comets were ambassadors between them indicating corresponding relation between the kingdoms on earth, so that valuable political information was to be gained from this study of the heavens.

In the West the appearance of a comet was [illegible] omen and hence recorded, but its path was not an important feature. Josephus mentions the [illegible] of a comet several months before the fall of [illegible] This was probably Halley's comet which [illegible] 66 A. D. The death of Emperor [illegible] D. was also preceded by a "comet," [illegible] Halley's.

Correspondence.

TOURMALINE DETECTORS FOR NAVIGATORS.

To the Editor of the SCIENTIFIC AMERICAN

In the June 5th issue of the SCIENTIFIC AMERICAN, S. A. H. asks if he can use a tourmaline to reduce the glare of sunlight reflected on water, so as to enable him to detect rocks lying under the water ahead of his boat. Light which has been reflected by water under an angle not very far from 37 deg. is partly polarized, and will therefore be reduced in intensity when passing through a tourmaline properly held before the eye. Light which comes from a submerged object passes easily through the tourmaline held in the position which extinguishes the reflected light. Made with a pan full of water and a submerged stone, the experiment is very successful, but practice alone would show how far the principle underlying it can be successfully applied to the detection of rocks submerged in rough water and observed from a moving boat under variable angles. A Nicol prism would probably prove more useful than a tourmaline A slice of tourmaline, cut parallel to optical axis, costs about $1.50. A Nicol prism, 8 millimeters square, costs $3.50. Both can be had from dealers in laboratory apparatus.

LIGHTNING

To the Editor of the SCIENTIFIC AMERICAN

Lightning is universally classified as chain, sheet, and ball, of prevalence in the order named, but, as to ball lightning, the recorded instances are so rare and questionable, with no evidence of its electrical nature, I am inclined to say that the information is not sufficient to enable one to form even a belief, much less a judgment, and least of all to formulate a rule respecting it.

Chain lightning has, perhaps, been as thoroughly studied and explained, and is as well understood, as any of the other great phenomena of nature

With respect to sheet lightning, I think the case is altogether different. This designation is given to that diffused illumination, best seen at night in heavy banks of clouds at a considerable distance from the observer, and said to be unaccompanied with thunder

I have long doubted the existence of sheet lightning as a form, having concluded that it is but an appearance, a reflection, of chain lightning occurring behind a cloud, the chain throwing out a diffused illumination, as may be seen from the tongue of an electric headlight of a *locomotive* on a *foggy* night

My first and greatest reason for coming to this conclusion is direct observation. I have seen in small clouds, concurrently sheet lightning illumination at one edge and a tongue shoot out from the other In such case, the obscured end of the chain is somewhere on the upper side of the cloud, and as I have observed that the center of the field of the diffused illumination is directly opposite the visible tongue on the other edge of the cloud, I think we are justified in saying that if the chain is not the cause of this illumination, it is nevertheless such an accompaniment as finds therein a full explanation

Another reason which has led me to conclude that sheet lightning is but an appearance, a reflection, from the chain, is, that the illumination always occurs on the upper side of a cloud at a point out of view of the observer, and he sees only the reflection at the margin of the cloud, or in the sky above the cloud, if at a considerable distance, no reason appearing why it should always be thus secluded

The same diffused illumination or reflection may be seen in the sky beyond the horizon on a summer night from lightning occurring at such distances as to be below the range of vision In such instances, the illuminations are always diffused, and the intervals in such perfect accord with our observations of thunderstorms at close range, I see no reason for not saying that they are due to the bolts of Jove.

My own experience confutes the alleged absence of thunder, that occurring only when the cloud is at too great a distance for it to be heard, said to be from ten to fifteen miles. I have frequently heard thunder accompany sheet lightning at close range, although this may still be open to the objection that the chain was playing simultaneously with the sheet, but, if so, it was above the clouds and out of sight.

My reason for calling attention to this at this time is that the mountain-climbing season is now upon us, and if those who ascend to the top report the appearance of the lightning they see in storms below them, and those at the bottom do likewise respecting the lightning observed above them, they can determine the fact very readily.

If what I have said be true, then chain lightning, occurring on the under side of the cloud, will appear to those on the mountain above as diffused light beyond the edge, or sheet lightning; while the sheet lightning, as seen from the foot of the mountain, will [illegible]

In this manner, the scientific fact could be ascertained, and if you will call attention to it, the present season will doubtless see the determination of the matter

FIRST AMERICAN TO CROSS THE CHANNEL THROUGH THE AIR.

To the Editor of the SCIENTIFIC AMERICAN

In view of the admirable though sensational flight of M Bleriot across the English Channel during the past fortnight, and in further view of the reported apathy of those wonderful American aeroplanists, the Wright brothers, toward attempting any similar flight, it may be of interest to your readers who are interested in aerostatics to know that the first flight through the air across the English Channel was successfully accomplished by an American in company with a Frenchman

My authority for this statement is Wise's "Aeronautics," published by John Wise in 1850

This rare and interesting volume, on page 54, chapter vi, contains this statement

"The most remarkable aerial voyage that was made soon after the discovery of aerostatic machinery was accomplished by M Blanchard, in company with Dr Jefferies, an American physician, who was at the time residing in England On the 7th of January, 1785 in a clear frosty day the balloon was launched from the cliff of Dover, and after a somewhat perilous adventure they crossed the Channel in something less than three hours. The balloon after its release rose slowly and majestically in the air, they passed over several ships and enjoyed a grand prospect of the numerous objects below them. They soon however, found themselves beginning to descend, which put them to the necessity of throwing over half their ballast, when they were carried one-third way across the Channel When they got about half way across they found themselves descending again, upon which they threw over the balance of their sand also some books they had with them. All this failed to overcome the gravitating power of the balloon They next commenced throwing overboard their apparatus—cords grapples and bottles An empty bottle seemed to emit smoke as it descended, and when it struck the water, the shock of the concussion was sensibly felt by the aeronauts. Still, their machine continued to descend when they next betook themselves to throwing off their clothing, but having now nearly reached the French coast the balloon began to ascend again and arose to a considerable height without compelling them to dispense with much of their apparel They passed over the highlands between Cape Blanc and Calais, and landed near the edge of the forest of Guinnes not far beyond Calais. The magistrates of the town treated the aerial travelers with the utmost kindness and hospitality The King of France made M Blanchard a present of 12 000 livres, as a token of appreciation of the aeronauts perseverance and skill in the newly-discovered art.

With apologies for my intrusion upon your time but with the hope that the contribution may be of some general interest.

THE NUMBER OF OUR ANCESTORS.

To the Editor of the SCIENTIFIC AMERICAN

As to the problem which vexes Mr Venning and Mr Constable, concerning the number of a man's ancestors, allow me to state that their difficulty arises from a false sociologic assumption

They assume that a man must have had four grand parents. This is not so He may have had only two For a long period in human society all daughters of one family were the wives of all sons of the family indiscriminately This "consanguine group" is an established fact in sociology All races, at one time or another passed through it As long as it lasted one's ancestors, no matter how far back he traced them would still be only two.

Hence one can have had 2^x ancestors x generations ago only if we make the x so small that it falls within the time since the consanguine group was outgrown That time is only a petty fraction of the time man has been on earth To establish a rule on what holds true during that fraction, and seek to apply it to the ages that went before, is false reasoning

In present society, however consanguineous marriages having been pretty well eliminated the 2^x rule does hold true. Considering the little corner of time covered by present institutions John Brown, x generations ago, had 2^x ancestors. No doubt about it.

The difficulty in reconciling this mathematical fact with our ordinary conceptions of the matter comes from the implied thought Each of us far enough back, would have had millions of ancestors at this rate. Since there are many millions of us to-day the earth would once have been so thickly crowded as to be simply uninhabitable, which we know was not so.

This difficulty vanishes at once when we remember that such a state of affairs could only exist if every pair of parents gave birth to only one offspring, and each man's ancestors were thus his and his alone. But since the majority of parents produce many more than one child this Simon pure possession of our ancestors all to ourselves is an impossible thing Our ancestors are all inter-owned by the race, each of our forebears is the forebear of a host of others also. And when each man counts up his own individually, those "own" have also been counted up as 'theirs" by hundreds or thousands of others, and any attempted total based on these countings can be nothing but a reduplicated monstrosity

Thus it is true that for modern non-consanguineous times a man had 2^x ancestors x generations ago. But the rule holds good only for those times and within those times the enormous totals urged in disproof of the rule are seen to be purely fictitious.

New York N Y SOLON DE LEON A B.

THE LONG ISLAND PORTAL OF THE PENNSYLVANIA SUB-RIVER TUNNELS

Although the immense improvements undertaken by the Pennsylvania Railway in bringing its lines under the rivers east and west of Manhattan to a station in the heart of New York city have aroused a great deal of popular interest especially on such epoch-making occasions as the meeting of tunnel headings under the Hudson and East Rivers and the recent placing of the last stone of the immense terminal station there is one section of the work of considerable engineering interest which has received very little attention from the press

This is the section just west of the Sunnyside yard on Long Island where the tunnels emerge from the ground, and the point of especial interest is the crossing of one tunnel over another

The object of this cross-over is to bring both east bound tracks to the same side of the station at Sunnyside, no other point being available for such a cross-over without unnecessary complication of trackage at one of the stations.

From the point where it diverges from the present main line near Harrison N J the Pennsylvania's road to New York is a double-track line one track being carried in each of the two tubes under the Hudson to the terminal station at 33rd Street One track and tunnel are used exclusively for west bound and the other for east bound traffic but on entering the station each track spreads out fanwise

The handsome terminal building appears so large from the outside with its half a million cubic feet of granite—1 140 carloads—27 000 tons of steel and 15 000 000 bricks that it is a little difficult to realize that much the greater part of the station proper is underground The underground area of the station is about 28 acres and includes 16 miles of standing room for trains on 21 different tracks, adjacent to over 4 miles of passenger platforms.

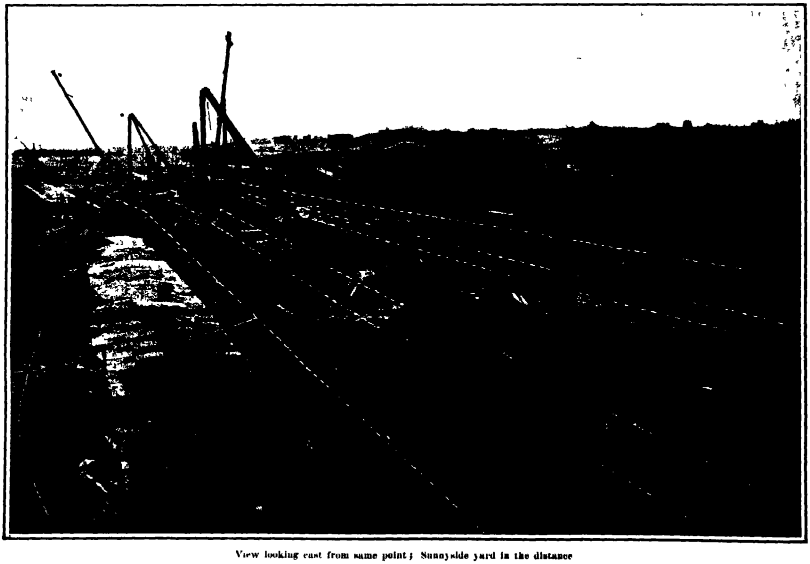
From the station eastward the tracks converge again into first 6 and then 4 tracks carried in two wide tunnels underground and four single-track tunnels under the East River

To bring the east bound and west bound tracks into their natural alternate order as the 21 tracks converge leaving the station would obviously cause a great complication of trackage and the same would apply to an only slightly less extent at the Sunnyside yard A cross-over could not conveniently be made in rock tunneling and less so under the river, so the place selected as most convenient was the "cut and cover' sections between Avenue A and Sunnyside.

The tunnels are now complete all the way from Bergen Hill N J under both rivers and Manhattan Island to Avenue A Long Island City and the section including Sunnyside yard and the cut and cover concrete tunnels for several hundred feet west of it is also practically complete The latter is shown in one of our illustrations, the position of the completed portions of the tunnels being shown in dotted lines and the retaining walls of the cuts where the tunnels emerge being visible in the distance on the left of the picture Along the left side of the picture is the brick-covered concrete top of the A or northernmost of the four river tunnels, which is now complete all the way to the Manhattan terminal The next section westward where the cross-over is being made is shown in our other illustration On the left in the distance where clouds of steam may be seen arising drilling is still in progress for further excavation of rock to make room for D tunnel (the southernmost of the four) the completed part of which is hidden by the massive shoring supporting the ground under the Long Island Railroad tracks seen in the picture The material excavated here is hoisted by the numerous cranes shown and used to bury A tunnel on the right of the picture High in the middle the concrete lining of C tunnel may be seen having been carried up to that level at a gradient of 1 9 per cent from the bulkhead line below which in the river all four tubes are at the same level the other three rising to the point shown at only 1 22 to 1 26 per cent

View looking west at Pennsylvania Railroad tunnels as they near the surface in Long Island City

The view shows the point where the tunnels [illegible] River near the Long Island portal



View looking east from same point; Sunnyside yard in the distance

On the left is seen the brick covered concrete top of one completed tunnel; dotted lines show position of completed portions of the others, to be joined to those shown in course of construction in other view

THE LONG ISLAND PORTAL OF THE PENNSYLVANIA SUB-RIVER TUNNELS.

Low in the foreground may be seen the entrance to B tunnel, which has now crossed under C to assume the relative position occupied farther back along the line by C tunnel.

Immediately behind the pile of earth on the right of the picture is the portal of the Steinway Belmont tunnels, leading under the river to the New York Central station.

An idea of the massive nature of the work may be formed from the size and number of the shores required to hold up the outer forms of the upper tunnel

The work is being covered up as fast as completed and about a year from now as passengers are carried through the tunnels, they will probably be unconscious even of the difference of gradient between tunnels B and C, and there will be no evidence on the surface of the immense work here shown of carrying one tunnel over the other

◆

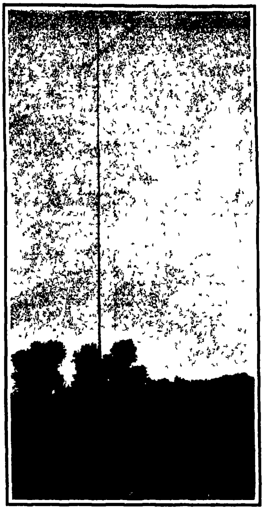
AN AUTOMOBILE WIRELESS TELEGRAPH STATION

The officers of the telegraph corps of the French army have been experimenting with an automobile wireless telegraph station Externally, the vehicle resembles a limousine of the ordinary type. The wireless apparatus is not conspicuously visible through the glass windows The mast, its base, and the winch by which it is raised are carried on the roof of the car and covered with an awning The car, all parts of which are movable, is divided into two compartments. The forward compartment contains the sparking coil and other dangerous instruments, the rear compartment contains a 5-horse-power dynamo, the receivers, the operating key, and a comfortable seat

The car and apparatus weigh 6 160 pounds. The weight is increased to 7 260 pounds by the addition of the crew of six men with their baggage. The car is driven by a motor of 22 horse-power, and can maintain a speed of 26 miles per hour on a level road, and more than 6 miles per hour in ascending a grade of 14 per cent.

The antenna is set up very easily and rapidly, owing to the ingenious telescopic construction of the mast, which, when lowered, consists of a number of concentric metal tubes about ten feet in length The central and smallest tube incloses a steel wire about ⅛ inch in diameter, coiled very closely into a helix so that it resembles a strongly compressed spiral spring, or the wire wrapping of a rubber hose The wire similarly coiled is extended into the base of the mast where it is gripped by two pairs of wheels which are operated by cranks and gearing By this mechanism the wire is forced upward, carrying with it the central tube, which, when extended to its full height, draws after it the second tube which in like manner draws out the third tube, and so on Although the elevation of the smaller tubes leaves the lower part of the wire inclosed in larger tubes which allow it to bend slightly it remains sufficiently stiff to keep all the tubes practically vertical

The mast with its aluminium support, weighs about 400 pounds. The telescoped mast is first screwed to its base and then raised to a vertical position by four men. A few seconds' work at the cranks then extends it to a height of 66 feet. The five wires of the antenna are attached to the top of the mast. Four of these wires, each about 160 feet long are distributed at equal angular distances around the mast and are attached to the ground by other wires, insulated from them, so that the lower ends of the antenna wires are about 26 feet above the ground The fifth antenna wire is connected with each of the others and is extended through a hole in one of the glass windows of the car to the apparatus inside The mast is also anchored to the ground by stays attached below the summit When the antenna has been set up the motor is geared to the dynamo only 3 horse-power being usually employed



The mast fully extended

The station can be made ready for operation in six minutes Its normal radius of action exceeds 90 miles As two men suffice to operate it continuous service can be assured by dividing the crew of six men into three watches of eight hours each

The French army already possesses wireless stations drawn by horses. Each station comprises two wagons one of which carries twelve men and a gasoline motor It takes half an hour to set up one of these stations and the radius of action is only about 60 miles. Nevertheless the *stations are superior to* those of the German army the installation of which occupies 45 minutes with a greater number of men. The *French* army is the *only* one that possesses an automobile wireless station

The installation of wireless stations on dirigible balloons has been contemplated but the problem presents an almost insuperable difficulty The highly charged antenna by its inductive action on the wires by which the car is suspended from the balloon would cause sparks which might ignite the hydrogen which escapes from the staunchest of gas bags. The danger could be diminished by substituting non metallic ropes for the steel wires but even the ropes would become conductors when wet

This danger does not exist in the case of aeroplanes It is estimated by experts that the total weight of an aerial wireless station need not greatly exceed 100 pounds The station could be operated by one man in addition to the aeronaut The day—apparently not very distant—when an aeroplane shall carry the weight of three men will soon be followed by the combination of those two present marvels—wireless telegraphy and mechanical flight

◆

Making Briquettes.

Briquette making formed the subject of a paper recently read before the South Wales Institute of Engineers by Prof W Galloway Small coal, as is well known cannot be burned so economically in the furnaces of boilers in its original state as when in the form of briquettes Briquettes made exclusively with anthracite coal burn too slowly and it is advisable to mix a certain proportion of bituminous coal to overcome this objection Up to the present no kind of agglomerating material other than pitch or resin or a mixture of these has given satisfactory results. Briquettes made with resin alone become soft and lose their shape in the fire those having a mixture of 4 per cent of pitch and 1½ per cent of resin give better results It is of interest to note that the total output in the United Kingdom in 1906 amounted to 1 513,220 tons, while Germany produced 14 500,851 tons of this fuel in the same year The paper contains full descriptions and drawings of the mixing and drying machinery and presses required for briquette making together with estimates of labor required and costs For example at an English works making 102¼ tons of briquettes per day of ten hours the total cost including labor materials fuel and stores interest and depreciation works out to 9s 7 45d per ton

◆

The linking of India and Ceylon by railway is again *under discussion* There is said to be no serious engineering difficulty connected with the bridging of the Paumben Channel nor at the south end of the line, for the island of Mannar is already practically attached to Ceylon But between the southern end of the island of Rameswaram and the northern end of the island of Mannar there is a distance of about 18 miles marked by an almost continuous coral reef either covered with shallow water or rising above the level of the sea in numerous coral islets—the stepping-stones' of Adam s Bridge—to be bridged

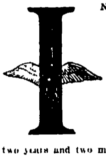
AN AUTOMOBILE WIRELESS TELEGRAPH STATION.

THE HEAVENS IN SEPTEMBER.

BY HENRY NORRIS RUSSELL, PH.D



IN the present month the event of the greatest astronomical interest is the very favorable opposition of Mars, which occurs on the 24th All through September the planet is very near us—from 36 to 37 million miles, and is better placed for telescopic study than it has been for us since 1892

Oppositions of Mars are frequent enough—about once every two years and two months but as its orbit is by no means circular its distance from the sun may vary from 128 to 154 millions of miles Taking the earth's distance from the sun as 93 millions the distance between the two planets when in line with the sun may vary all the way from 35 to 61 millions of miles

At the present time conditions are almost ideally favorable Two years ago it is true Mars was almost as near us as he is now but then he appeared so far south in the heavens that he could hardly be observed in our latitude while in England as one of the Greenwich observers aptly said he hardly rose above the tree tops This year he is almost on the equator and it will not be necessary as it was then to go far south to observe him at a proper altitude

Being so near us he appears unusually large in the telescope and very bright to the naked eye fairly rivaling Jupiter and surpassing all else in sight so that one has but to look at the sky to find him

Of course this good opportunity will not be lost by those astronomers who make a study of planetary detail What they may discover we will know later at present it may be worth while to speak a little of the conditions under which the work must be done

Mars at his best looks only about 1/75 as big as the moon (with the same magnifying power) On account of the unsteadiness of our atmosphere (which makes everything seen through it appear to dance about and be more or less blurred) it is only under very favorable circumstances that a magnifying power much greater than 1,000 diameters can be used That is it is only on these rare occasions that we can see Mars as well with a great telescope as we can see the moon with a good binocular or spy glass magnifying 13 times Under ordinary conditions the bad seeing would make it impossible to see anything like as much on Mars with the big instrument as can be seen on the moon with the small one

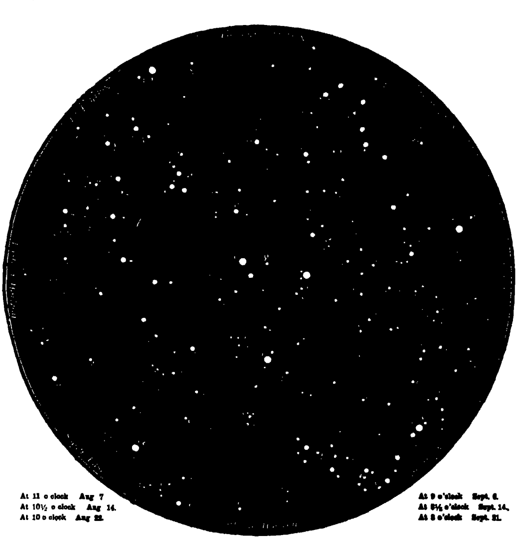
The same difficulty affects photography The image of Mars with the same telescope is only 1/75 as big as the moon's but the grain of the plate is of the same size If we try to enlarge the planet's image by auxiliary lenses we lengthen the exposure time so that the image is blurred by bad seeing The remarkable results obtained at the Lowell Observatory were gained by a judicious choice of enlarging power combined with a very favorable climate and great manipulative skill

Even if our air was by a miracle quite steady there is a limit to what we can see on Mars No telescope however perfect can make the image of a star a mere luminous point as geometrically it ought to be This arises not from the character of the lenses mirrors etc but from the very nature of light Knowing that light consists of wave-like vibrations it is possible to show (by methods too technical to be briefly explained) that the image of a star seen through a round opening like that of a telescope will not be a sharp point but a small disk of light fading away gradually at the edge and surrounded by much fainter rings of light. Similarly the image of a straight line is not a similar line, but a streak of definite width, bordered by much fainter streaks. The larger the aperture of the telescope, the smaller will be these spurious images. By stopping down our lens to one-half its size, we make them twice as big, and so on

Their actual size is very small. With the great Yerkes telescope the spurious disk of a star is about 1/2400 of an inch in diameter. But on the image of Mars at its nearest, this corresponds to nearly 20 miles on the planet's surface

Nothing much smaller than this can be seen clearly with any existing telescope, even under ideal conditions A narrower black line would seem blurred out into a gray fuzzy streak—much like a photograph out of focus, as regards appearance, though quite different optically—and a black dot into a faint gray patch.

It is of course one of the first duties of an observer to learn to recognize these spurious images, and distinguish them from real ones and also to attempt the more difficult task of seizing the moments of good seeing between the disturbances of the image due to our atmosphere But the fact remains that we cannot see clearly anything less than 20 miles across upon Mars (or anything much less than 50 miles, except with a very few instruments) and that therefore any visible evidences of life or of intelligent construction on the planet would have to be on an enormous scale.



At 11 o clock Aug 7

At 8½ o'clock Sept. 14.
At 8 o'clock Sept. 21.

At 9½ o clock August 29.

• NIGHT SKY: AUGUST AND SEPTEMBER

THE HEAVENS.

Right overhead at our hour of observation is Cygnus one of the finest of the constellations. Our initial letter shows the figure of the Swan flying southward along the Milky Way, with the star β marking its head, the line $\zeta\ \epsilon\ \gamma\ \delta\ \kappa$ (the last not on the map) its widespread wings, and with α, the brightest of all, in the midst of its body

Two or three stars in it deserve special attention. α is notable because the most careful measures of its parallax fail to give a sensible result. This star, though apparently one of the brightest in the heavens, is at a literally immeasurable distance Its real magnitude must be exceedingly great.

β is a fine wide double, yellow and blue, also at a very great distance

Most interesting of all is the small star 61 Cygni (marked on the map) which is just easily visible to the naked eye This is the first star whose distance was measured (by Bessel in 1838) Numerous recent measures have determined its parallax and distance with an uncertainty probably less than five per cent. Its distance from us is 10¼ light years, or 62 millions of millions of miles. At this distance the sun would look about as bright as the pole star now does to us. 61 Cygni appears to the eye only about 1/10 as bright as this. As it is a double star, neither of the two can be 1/10 as bright as our sun. They are in slow relative motion, which in the last century has shown very little curvature, but it is pretty certain that they are really moving in a vast orbit, whose circuit may occupy a thousand years or more.

West of the zenith, and high up, is the brilliant steel-blue Vega, and in the south is Altair, which is about one-half as bright. Above the latter are the small groups of Delphinus and Lagretta, and below are Capricornus, with its familiar double stars, and Sagittarius. Scorpio is setting in the southwest, and Ophiuchus is above it. Hercules and Corona are below Vega, and Arcturus lower still, almost due west. The Great Bear is low in the northwest, with the Little Bear and Dragon above her

In the northeast Cepheus is high above the pole, Cassiopeia below, then Perseus, and lastly Auriga, which is just beginning to rise. In the east is the great square of Pegasus, with Andromeda on the left and Aquarius on the right.

The solitary star in the southeast is Fomalhaut. The very bright object a little south of east is Mars, and the fainter one about half way between this and Aries is Saturn.

THE PLANETS.

Mercury is evening star all through the month and is visible in the first half of it, setting about 7 20 P M. on the 1st, and 7 P M. on the 15th. He is at his greatest elongation on the 17th, when he is 26 deg. east of the sun, but being also some 11 deg. south of it, he is not very favorably placed.

Venus is evening star, setting about 8 P M on the 1st, and is moving rapidly southward so that on the 30th, though farther from the sun, she sets at about 7 20

Mars is in Pisces, and comes to opposition on the 24th He is visible all night long, and is exceedingly conspicuous During the month he moves slowly westward among the stars and at its end he is quite near the "first point of Aries" from which longitudes and right ascensions are measured, being about 4½ deg. south of it.

Jupiter is in conjunction with the sun on the 18th, and practically invisible all through the month

Saturn is in Pisces, and rises about 7 30 P M on the 15th, so that he is observable most of the night.

Uranus is in Sagittarius and crosses the meridian at 7 37 P M. on the 15th.

Neptune is in the constellation Gemini, and rises a little after midnight.

THE MOON

Last quarter occurs at 8 P M on the 6th, new moon at 10 A. M on the 14th, first quarter at 1 P. M. on the 22nd, and full moon at 8 A. M. on the 29th. The moon is nearest us on the 1st and again on the 29th, and remotest on the 16th.

On the evening of the 1st she is in conjunction with Mars, and as seen from the eastern United States, passes right over him, hiding him for nearly an hour This will be a most interesting affair to watch

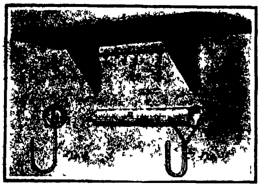
As seen from Washington, Mars disappears at the eastern side of the moon at 8 42 P M., and reappears almost at the opposite point, at 9.39 These times will be earlier for places west of Washington, and later for those east of it, *after allowance is made for the difference between standard and Washington time*

The moon is also in conjunction with Saturn on the 2nd, Neptune on the 9th Jupiter on the 14th, Mercury on the 16th, Venus on the 17th, Uranus on the 23rd, Mars again on the 28th, and Saturn on the 29th; but these are of less interest, though the second conjunction with Mars is close, and an occultation is visible in South America.

Patent Department

SHEET-METAL SHELF

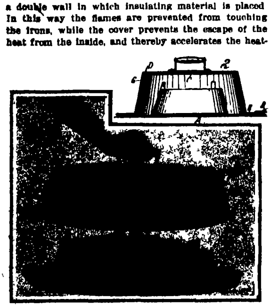
Pictured in the accompanying engraving is a shelf formed of sheet metal, which is so arranged that it may quickly be attached to a wall or other support, and as quickly detached and folded compactly for storage or transportation The shelf proper consists of a sheet metal piece *A*, provided with depending flanges The brackets *B* are pivoted on pins *C* which are journaled in the flanges of the shelf The brackets are also provided with flanges at the rear end with holes for screws, with which the shelf is attached to the support. The brackets also support a pair of bars *D*, from which hangers *E* are suspended The end of each bar is flanged outwardly as indicated in Figs 2 and 3 The brackets *B* are formed with openings *F*, shaped like a keyhole, that is with an enlargement above to admit the flanged ends of the bar *D* and a constricted portion for the body of bar which is kept from slipping out by the flanged ends The hangers *E* are formed of a single length of wire bent double as shown to the best advantage in Fig 3 The ends of the hangers are formed with rings *G* The bars *D*, which are hollow, are slotted lengthwise and the ends of the hangers are introduced into this slot while the rings *G* prevent them from slipping out. Either one or both bars may be used and the hangers provide convenient support for various articles It will be evident that the device may be folded up in a moment's time, the brackets lying within the flanges of the shelf *A*, so that the device occupies a minimum space The inventor of this device is A Dahl of 302 West 144th Street, New York city



SHEET-METAL SHELF

SAD-IRON HEATER AND RECEPTACLE

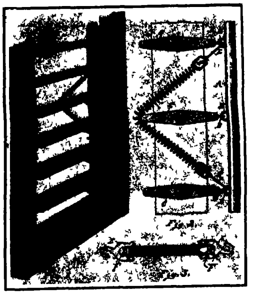
When heating sad irons on oil and gas stoves there is danger of the irons becoming coated with soot, owing to their direct contact with the flames In order to overcome this difficulty the sad iron heater illustrated in the accompanying engraving has been designed. It consists, in general of a plate or tray adapted to rest on the stove and a cover formed with a double wall in which insulating material is placed In this way the flames are prevented from touching the irons, while the cover prevents the escape of the heat from the inside, and thereby accelerates the heating of the irons. In the engraving, the tray is indicated by the letter *A* The rim of the tray has an extension *B* at one side, formed with a slot. The construction of the cover is clearly shown in the sectional [illegible] It comprises an inside wall *C*, and an exterior [illegible] The wall *C* is formed with a flange *E*, at the lower edge, on which the edge of wall *D* rests. At one side the flange *E* is extended to form a tongue *F* Between the two walls of the cover, a layer of asbestos *G* is placed This layer is placed only at the top of the cover, leaving an air space between the two walls at the sides as shown The handle of the cover is attached thereto by means of bolts which pass through to the interior wall *C* and serve to clamp the two walls together When the device is not in use the tongue *F* is slipped through the slot in the extension *B*, and the whole device may then be hung on a hook passing through an opening in the tongue The inventor of this improved sad iron heater is Mr Frederick W Wantzel of Rossmere Lancaster Pa.



SAD-IRON HEATER AND RECEPTACLE

SLAT ADJUSTER FOR WINDOW BLINDS

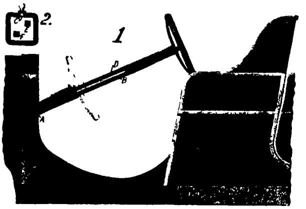
The ordinary window blinds are not provided with any means for holding the slats open or closed other than the friction of the slats themselves. When the slats work loose they are apt to close or open of their own weight or under action of the wind and in stormy weather they are quite apt to rattle. This difficulty is overcome by using a device such as illustrated in the accompanying engraving In the sectional view Fig 2 the slat rod is indicated at *A* It is provided with the usual staples *B* to which the slats *C* are secured by means of hooks or staples *D* The slat adjuster consists of a coil spring which passes over the end of one of the slats *C*, and is attached at each end to the staples *B* by means of hooks *E* The tension of this spring is made adjustable by means of a U-shaped clip *F*, which is provided with fingers that engage the coils of the spring as shown in Fig 3 The hooks *E* are caught under the clips and are free to adjust themselves to the various positions of the spring as the slats are moved to open or closed position If desired an ordinary coil spring terminating in a hook at each end may be used as indicated in Fig 1 but the adjustable spring is preferred as it may be fitted to slats of different sizes and the tension may be regulated to a nicety With the adjuster in place the slat bar is held tightly against the slats preventing it from rattling and the springs also prevent the slats from moving up or down after they have been set in a certain position The inventor of this device is Mr Ernst W F Herrmann, 314 Pas Hondo Street San Antonio, Texas



SLAT ADJUSTER FOR WINDOW BLINDS.

TELESCOPIC STEERING GEAR.

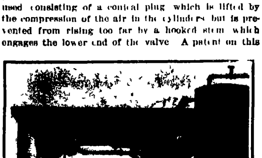
The most suitable position for the steering wheel of an automobile is to have the wheel close to the chauffeur's seat and on an axis that lies at about twenty three degrees from the horizontal or even less. Unfortunately with the steering wheel in this position, it is awkward for the driver of the machine to get into or out of the seat. Furthermore the steering column acts as a bar to prevent occupants of the automobile from mounting or alighting from the machine on the chauffeur's side To overcome these objections and yet keep the steering wheel at the most suitable angle, a telescoping type of steering column has recently been devised As shown in the accompanying engraving, the steering column comprises two hollow members of approximately rectangular form (see Fig 2), the member *A* being connected to the steering gear in the usual manner while the member *B* which carries the steering wheel, is arranged to slide within the member *A* It is not essential that the two members be of rectangular form, but any other form will do, hexagonal, for instance, or oval, which will do away with the necessity of keying one to the other In Fig 1 the position of the wheel when the steering column is telescoped is indicated by dotted lines. The steering column may be extended to any degree desired by the driver of the machine and locked in this position by a spring pressed pin *C* on the member *A* which is adapted to enter any of the perforations *D* spaced at regular intervals along the member *B* Within the member *B* are the connections *E* and *F* running to the spark device and throttle control These connections are also of telescope construction, as indicated in Fig 2 The inventor of this telescoping steering gear is Mr C J Schoening Box 112 Honolulu H. I.



TELESCOPING STEERING GEAR FOR AUTOMOBILES

WAVE AND GRAVITY MOTOR

A recent patent describes a new form of wave motor in which the power of the waves of the sea or ocean is utilized alternately with the power of gravity to operate an air compressor The compressed air is stored in a reservoir and may be piped to any point desired, so that the energy of the waves may be utilized at a considerable distance from the ocean The apparatus comprises a platform built out over the water A pulley *A* is attached to the under side of the platform and a rope which passes over this pulley is fastened at one end to a large caisson or float *B* while the other end carries a counterweight *C* The float rises and falls under action of the waves and the weight keeps the rope taut The pulley is thus rotated back and forth by the action of the rope thereon The pulley shaft is geared to a crank shaft which operates the two pistons of the compressor The two cylinders *D* of the compressor are provided with valve-controlled outlet passages which communicate with a common pipe *E* connected to the reservoir *F* The weight and float are so proportioned that a lowering of the water level causes a lowering of the float and a raising of the weight while when the water level rises the weight is sufficiently heavy to cause a positive rotation in the reverse direction of the pulley shaft. Thus the weight rotates the shaft in one direction by gravity and the float rotates the shaft in the opposite direction when the waves recede To simplify the construction the cylinders *D* are left open at one end and no inlet valve is provided other than the piston washer A very simple form of outlet valve is used consisting of a conical plug which is lifted by the compression of the air in the cylinders but is prevented from rising too far by a hooked stem which engages the lower end of the valve A patent on this wave and gravity motor has been secured by Mr Allen T Ransom 44 Scholes Street Brooklyn N Y

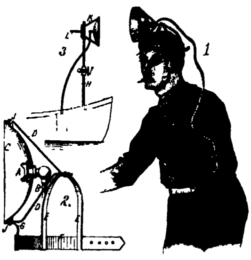


WAVE AND GRAVITY MOTOR

In 1907 the United States produced 166 000 000 barrels of oil and in 1908 according to unofficial estimates the total was more The United States produced 63 12 per cent of the entire oil production of the world

A PORTABLE LAMP

A very convenient form of lamp has recently been devised for the use of campers hunters, etc. It consists of a portable acetylene gas generator, and a burner arranged within a reflector which is open at the front for the escape of heat. The walls of the reflector are imperforate to prevent the passage of air through the reflector when the lamp is being moved about or is exposed to the wind In this way the danger of extinguishing the light is avoided The accompanying illustration shows in Fig 1 how the lamp may be attached to the head of a man while the gas generator is secured to his belt The details of the head attachment are shown in the sectional view, Fig. 2. The burner *A* is attached to the flexible tube *B*, which runs to the generator The reflector *C* in which the burner it fitted is provided with a flange along its outer edge, to which the arms *D* are secured These arms are fastened to a cage *E* provided with a strap *F*, which is strapped about the head of the wearer As an additional support to the lamp, a small bracket *G* connects the bottom of the reflector directly to the head strap When it is desired to use this device on a boat or in camp, it is mounted on a stand *H*, as indicated in Fig 3 This stand is formed of two sections, one of which is hinged upon the other so that the lamp may be moved laterally By means of a thumb screw *I*, the two sections may be clamped at any desired position The lamp is taken out of the head gear by unscrewing the bolts *J* and it may be then fastened in a bracket *K*, which is swiveled on the upper end of the stand The swiveling bracket is provided with a handle *L*, which enables one to move the lamp about in any desired direction The inventor of this portable lamp is Mr O A Loveless of Waters Meet Mich

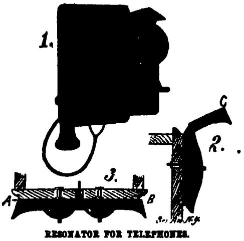


A PORTABLE LIGHT FOR CAMPERS.

◆

RESONATOR FOR TELEPHONES.

Pictured in the accompanying engraving is a device adapted to augment the sound of telephone bells or other signals so that the signal may be heard in places where there is more or less noise The device is particularly adapted for use in shops, pumping stations, and the like where ordinary sounds are not discernible especially under heavy atmospheric conditions or in damp or rainy weather The device consists of an elongated dished body formed with sound reflectors at opposite ends and a similar sound reflector overhanging the center of the body This device is placed behind the bells of the telephone and acts to reflect the sound in a definite direction The reflectors referred to are indicated at *A B* and *C* in the illustration. It will be observed that they are of conical form, and the reflectors *A* and *B* serve to catch the sounds which ordinarily travel out in a lateral direction from the telephone, and direct them forward The reflector *C* serves similarly to collect and reflect the sound waves that pass upward. For convenience in manufacture the reflector *C* is preferably made in a separate piece, but the portion which extends to the main body is tangent thereto and flattened, in order that a neat joint with the body may be effected The device is extremely simple, and can readily be attached to a telephone by means of a couple of screws. The form of the reflector can be modified to throw the sound to one side if desired instead of directly forward The inventor of this resonator is Mr Patrick E Finlay of New Orleans, La (No 2 St Louis Pumping Station)



RESONATOR FOR TELEPHONES.

RECENTLY PATENTED INVENTIONS

Electrical Devices.

ELECTROLYTIC CELL. J McPHAIL, Carteret N J The inventor seeks to construct an electrolytic cell in which there may be brought about a complete separation of the products with a minimum of undesirable by products, the cell occupying a comparatively small space and being simple and easily handled

TELEPHONE ATTACHMENT B F DERRICK, New Albany Ind In view in this case is the provision of a construction comprising a bracket and a frame for carrying the receiver of the telephone swingingly mounted on the bracket and adapted to rest on the circuit controlling arm of the telephone when swung to a depressed inoperative position and release said arm when swung upright in position for use

Of Interest to Farmers.

DUMPING VEHICLE – I BRAND and C G GLASRUD Sheyenne N D The invention relates more particularly to a vehicle having a running gear of any suitable type a frame rigidly carried by the rear axle of the vehicle and a wagon body mounted upon the frame the rear axle serving as a pivot to permit the body to be tilted so that its contents can be dumped

INSECTICIDE –J W WOODS Portland Ark The ingredients composing this destroyer are to be thoroughly mingled by agitation and applied to the plants infested with boll weevil or other insects by sifting the same over the plant The compound may also be applied to the infested plants in any other desirable manner

COMBINED BED SHEET AND SHELTER TENT F WHITNEY Cimarron New Mex The sheet is for use by stockmen which may be quickly supported in the form of a shelter tent, the device being so constructed that it can be readily packed for transportation and which is complete in one piece with ropes attached so that it may be adjusted with supports as a tent or when desired may be used as a bed sheet the stockman having the complete device in compact form at all times except the supports which can readily be obtained

Of General Interest

BEER TAPPER R H STIKES Washington D C The tapper is of that form in which a bung casing is screwed into the head of the barrel and is provided with separate ports, through one of which compressed air is admitted to the barrel while beer is drawn out through the other With this form a detachable coupling bearing separate tube connections, for the air and beer is arranged to be turned into the casing and in the movement to operate a valve which simultaneously opens or closes the air and beer ports

METAL-DEPOSITING APPARATUS I K BEYNARD East Elmhurst N Y It has been found that the distinctness of the sound produced by phonograph records is much increased by depositing upon the wax a fine layer or film of metal previous to electro-plating The metal preferably used is gold The invention reduces the consumption of gold and preserves a perfect seal for the vacuum chamber in which the depositing operation takes place.

BOX W L HOWLAND, Cedar Rapids Iowa In the present invention the improvement pertains to boxes and has for its object the provision of a box preferably made of wood which while strong can be easily and cheaply manufactured and may be quickly put together by the user when desired

METHOD OF TREATING WOOD DURING DISTILLATION H W DOUGHTY, Amherst Mass In this instance the intention is to provide a new and economical method of utilizing the waste from resinous pine wood in the form of saw dust mill-chips etc to recover in commercially valuable forms the various constituents of such wastes

CONCRETE MOLD R N NEIL Cozad Neb One provision in this case is that for a mold with side members which are connected by spools supported by rods disposed therein the spools having hollow heads in which the rods are screwed there being additional threads in recesses in extremities of the heads in which nuts having orifices are adapted to mesh means in the heads preventing the rotation of heads on bolts which are disposed on the orifices in the nuts

ENVELOP FASTENER.—J E A THORLANDS Piedmont Fla An object here is to provide a fastener which can be applied to any common form of envelop which prevents the unauthorized opening of the envelop without leaving traces of such an act which is inexpensive and which adds but slightly to the weight or bulkiness of the envelop.

Hardware.

SHADE-BRACKET H WITTMANN Cincinnati Ohio In this patent the invention is an improvement in curtain fixtures and has for an object among others to provide a novel construction by which the brackets may be readily applied and adjusted to suit any suitable length of curtain and then clamped in position

FOOT REST FOR SHOE-SHINING STANDS G F OLIVER and R ROUSSEAU Ilion N Y The invention pertains to foot rests such as used at shoe shining stands for supporting the feet when the shoes are being polished The object is to provide a rest which will operate to hold the foot rigidly in position and at the same time permit the sides of the shoe to be exposed

DOOR LOCK G W NORTHRUP Brainerd Minn This invention refers to door locks of the class known as mortise locks, which are embedded in a door by forming a recess in the body of the door from the free edge inward The purpose is to provide a lock of simple construction and while possessing all the advantages of the mortise lock may be placed on thin doors or those of greater thickness.

MITER BOX F W McLEAN West Monroe La The patentee has for his object the provision of a device which is light and compact, and one that will permit the use of an ordinary hand saw by drilling a single hole therein, and with which the full length of the saw will be utilized

SASH LOCK —L H GRAY San Francisco, Cal The invention may be defined as consisting of a bolt insertable in the overlapping portions of the sash frames at each corner the bolts passing from the inside through the lower sash into the upper sash and guard plates movable over the heads of the bolts to prevent the bolts from being punched out from the outside of the window

Heating and Lighting.

PREHEATING LIGHTING-FIXTURE. — W N BEST Sr New York N Y The invention relates to improvements in fixtures and more particularly to that type in which combustible gas is burned and the products of the combustion of the flame are delivered to the interior of an inverted mantle The device supports the mantle and permits the gas to be heated to a high temperature before it is burned and before it is delivered to the mantle

REMOVABLE FURNACE-OVEN — N F STORMS, Minneapolis, Minn The object here is to provide an oven for removable attachment to a furnace or regular heater to permit using the oven for baking and other purposes and without placing the oven and its contents directly over the burning fuel in the fire-box or subjecting the contents of the oven to the action of the obnoxious gases incident to burning of the fuel in the fire box

THERMOSTAT W ENTERLINE, Big Run Pa Mr Enterline's invention relates to a thermostat which may be disposed against a boiler and which while inexpensive to construct may be readily adjusted to a boiler of any type and will automatically and accurately regulate the supply of gas which is supplied to the burner under the boiler

Household Utilities.

REGULATING VALVE —H C BENWITZ Chicago, Ill The invention is an improvement in regulating valves for the hot and cold water supplies leading to wash stands, bath tubs, and other similar places. The valve includes an actuating lever or handle which is operable not only to control both the hot and cold water supplies but also to control the water or outlet

MEASURING APPARATUS. R. HOYT, New York N Y The invention pertains to apparatus for measuring various materials it being particularly useful in connection with packaging machines in which it is desired that a measure by weight shall be quickly made and with substantial accuracy

STRAIGHTENING MACHINE E A LAKE, Fulda Cal The invention refers to machines for removing bulges, dishes, dents, and the like from metal especially from band saws, and relates more particularly to a machine having removable rolls, one of which has an annular concave part spaced inwardly from the edges of the roll whereby the latter has flat parts at each side of the concave part, and a second roll having at each side of the convexed part flat portions.

CHANGEABLE SPEED GEARING — W SCOTT, Sheridan Wyo One object of the improvement is to supply a gearing more especially designed for use in the driving mechanism of automobiles and other machines, and arranged to enable the operator to use any one of four different speeds for driving ahead and a single speed for driving backward.

HOISTING-MACHINE. — C F DALLMAN, Antigo, Wis. The machine is for use whenever a hoisting drum is desired for raising or lowering loads, power being applied through a shaft, which through its connection with a second shaft rotates the gear wheels at each end of the drum Mechanism is arranged to operate the drum from a distance the operation of the drum being the same whether it is manipulated directly by a bar lever or intermediately by the three-armed lever

HYDRAULIC GOVERNOR.– A DICKERSON, American Fork, Utah In this mechanism which in part is operated upon the same general principle as in the steam governor formerly patented by Mr Dickerson, the hydraulic piston constitutes an automatic check to the movement of the whole gate mechanism The gate follows every move of the governor and if there is any change of pressure of water on the gate the whole will automatically readjust itself without necessitating a change in the speed of the engine

MACHINE FOR MAKING MACARONI AND THE LIKE.—J RIVARA Natchez, Miss. The aim in this case is to simplify the construction of machines of the pastry class and to adapt the screw which operates the plunger or piston, to be quickly withdrawn from the cylinder in which dough or other material is pressed to produce macaroni or other product

YARN PRINTING MACHINE — N COSTIKYAN Leicester England. The intention of this inventor is to provide a machine for use in printing warp yarns, especially carpet or pile yarns, according to a predetermined pattern and arranged to permit printing at one operation as many knots or spaces as desired and in one or more colors

Machines and Mechanical Devices.

DUMB WAITER OR ELEVATOR —C A STURM and R N BLACK Portland, Ore This invention is intended especially to be used where the waiters or cages are operated from a point outside of the cage or waiter An object is to provide means for indicating to the operator when the car has arrived at the end of its travel up or down

AUTOMATIC FIREARM —J J BRITGRABER St Louis Mo In operation when the breech block has reached its rearmost position the cartridges may be fed up from the magazine and the block may then move forward with the barrel and the block latch will adjust in rear of the block and travel therewith and with the barrel forwardly locking the block from any rearward movement until the barrel has again been pushed back in position in which the locking latch may be released to release the block

SINTERING MACHINE —A B YOUNG, Salt Lake City Utah One of the purposes in view in this improvement is the provision of a device in which finely divided ore may be brought into a conglomerate mass by a sintering process and then may be delivered free from the machine in blocks of convenient size for subsequent treatment in a blast furnace.

MACHINE FOR MAKING CELLULAR BOARDS. —S M LANGSTON, Camden, N J In the present construction the machine is especially adapted for making asbestos board, and involves mechanism for pasting together two sheets corrugating the combined sheets, heating them to dry the adhesive material and retain the corrugations in permanent form and then securing a third sheet to the [illegible] the corrugations of the double corrugated sheet.

ELEVATOR.—E. C. Foster, Telluride, Colo. The invention is an elevator for water, slimes, grain, and other fluid matter, and provides a machine which will do a large amount of work with comparatively small power and contains no valves or other parts apt to wear out or get out of order, and which is capable of use at any inclination from vertical to horizontal

MACHINE FOR MAKING CARTONS.—S M Langston, Camden N J This invention pertains to certain improvements in machines for making cartons, and more particularly for making that type of carton in which a strip of sheet material is bent to form a tube and in which the meeting edges are secured together by a strip of tape or the like.

STEAM HAMMER.—T R. Holmes 8 Oakdale road, Sheffield, England In this invention the object is to provide improved controlling gear whereby to render a self acting hammer more perfectly amenable than heretofore to the will of the operator so that the latter will be enabled to regulate with greater certainty than hitherto, the frequency intensity and length of stroke of individual blows

VARIABLE-SPEED GEARING.—J Blum, Winnipeg Manitoba Canada. The principal object in this invention is to provide a plurality of non rotatable gear members, any one of which may be brought into engagement with a rotatable gear member to cause a rotation of the latter as it moves bodily along the face of the stationary member

LOOM TEMPLE.—A Fortuna Manchester, N H. This invention prevents unequal wearing of the slide bar and tipping even when the bar is already worn When worn so that there is a tendency of the bur roll to tip downwardly at its outer end a bar is lowered toward a lateral lug to correct tipping after which it is secured by a set screw Means assist in supporting the torsional pull and making the leverage of resisting force more nearly equal to that of the opposing force

DRILL AND CUTTING MACHINE.—E. A Cunningham Oskaloosa Iowa This mechanism includes a rotating bit and is arranged so that the bit is normally free to travel forward slowly as it turns, but is stopped or checked automatically in its forward travel whenever it encounters an obstacle unusually hard to penetrate yet the bit is free to travel rapidly forward when the boring through the unusually hard obstacle is complete

AIR SHIP.—C J Bratten Pinctown, N C The wings of the aeroplane spread a greater distance transversely to the line of flight than the fore and aft distance This follows the analogy of the wings of a bird and founded on the principle of physics essential to successful aeroplanes, which secures a short transverse impact of the wings upon the relatively still air whose inertia gives the resultant upward pressure to buoy up the aeroplane and allow quick clearance of the air in the rear

Prime Movers and Their Accessories.

METHOD OF UTILIZING HEAT OF COMBUSTION AND STEAM POWER IN PRIME MOVERS.—T Schtscherbakoff Moscow, Russia In this apparatus an internal combustion chamber is inclosed within a steam boiler so that steam is generated from heat developed in the combustion chamber and the products of direct combustion are conducted through certain controlled passages to the engine cylinder

Railways and Their Accessories.

SPIKE.—C D Walcott Washington D C This spike is one that may be cheaply formed from rolled bars and one that avoids the splitting of the tie and which does not turn or rotate about its longitudinal axis in driving and which withal possesses a much greater holding effect when sunk into the wooden tie than spikes of ordinary cross section

RAILROAD-TIE.—G Whitaker, Temple Texas. This invention is an improvement in railroad ties and fastening and has for an object to provide a simple novel tie that can be used in connection with the ordinary wooden ties, and can be used on any ordinary ballast, will form in itself a track gage and will facilitate the fastening and releasing of the rails as may be desired

AUXILIARY COUPLING HEAD.—P W Hogan Durand Mich The invention is an improvement in heads of the character shown and described in Letters Patent formerly granted to Mr Hogan, the said coupler head having for its purpose to serve as a substitute for a broken coupler head of the "Master Car Builders" type and is connected to engage the draw-bar of the broken coupler at the rear of the head and project a slight distance in advance thereof

AUTOMATIC RAILROAD-SWITCH.—I A Call, Salt Lake City The object here is to provide a switch which may be operated from the train or engine while the same is in motion, or by hand in the usual manner and a switch of the stub rail type which will not be liable to clog from snow, dirt, or other causes, nor from contraction or expansion of the rails at the switch.

TURN-TABLE.—M J Leonard, Long Branch, N J Mr Leonard's invention comprehends a turntable the upper surface of which always remains at the same level, the descent of the weight thus being independent of the upper level of the table—the weight being raised by the forward movement of the locomotive or other piece of rolling stock to be turned.

CAR DOOR.—C. W Leaning Yankton S D This invention has reference to car doors, and more particularly such as are formed of a number of independently movable sections arranged on guideways and adapted to be moved into operative positions away from the doorway of the car when not in use

TRACK DEVICE FOR RAILWAY SIGNALS.—M M Kane Montgomery Ala The aim of this inventor is to produce a device which can be operated by a train passing in either direction, and which is constructed in such a way that it can be readily actuated by a switch point so that a signal near a switch may be controlled from the switch through the device to indicate whether the switch is open or closed

CAR WHEEL.—I P Todd, Middlesboro Ky In the present patent the aim is to provide a wheel especially adapted for mining cars, and provided with a detachable hub which may be removed when worn out and replaced by a new one, or should the wheel proper be injured it may be replaced by a new one, using the old hub

AUTOMATIC SIGNAL AND STOPPING DEVICE FOR RAILROAD-TRAINS.—F J Miller, Cincinnati Ohio This inventor's purpose is to avoid collisions and his device comprehends the electro-magnetic devices in the road bed acting in connection with electro-magnetic devices on engine or car whereby the entry of a train upon a section of track already occupied, will actuate in the on-coming train a signal and will cause automatic devices to be set into action by which the throttle valve is closed and the train is automatically stopped

CAR BRAKE.—H Hoffmann New Rochelle N Y The improvement is on a patent formerly issued to Mr Hoffmann and the present invention is particularly applicable where a brake drum is provided upon which a cable or chain is wrapped the braking force being applied to the brake mechanism through the said chain

RAIL FASTENER.—J Fogel, Millersburg Ohio In operation the rail can be fastened or loosened with a sledge and the use of nuts and bolts is avoided The fastener can be applied to a joint as well as any part of a rail between joints and the gage of the track can be changed by removing the metal plate fasteners from one side of the rail and placing them on the opposite side The tie and fastener are thus adapted for use on a curved and straight track.

NUT LOCK.—W R Garner Palestine Texas The device is a combination nut lock and washer and is especially for use on railway rail joints In application the nuts should be loosened sufficiently to permit the driving of the depending washer plates between the nuts and the back plate or angle bar These plates are attached to a top plate and the shoulder springs are also attached at their upper ends to the top plate but all are detached thence to their lower ends Mr Garner has also patented another nut lock in which the nuts will not only be prevented from turning but the plates and angle bars will be held tightly in position on the rail joints to prevent the rails from moving or spreading and the rails going down or dropping in a soft road bed and nuts prevented from rattling or turning back over the bolts and lost motion of nuts and angle bars will be followed up by the spring washers and spring arms

Pertaining to Recreation

DRUM.—A D Converse Winchendon Mass. In this improved construction the head is formed with a hoop section at one end of greater diameter than the body of the drum and the head is also provided with a hoop section which engages with the hoop section of the body and is locked thereto to hold the drum in position

Pertaining to Vehicles.

AUTOMOBILE FIFTH WHEEL.—E. A Oliver, Richland, Mo The objects of this invention are first to provide means by which a cable running from a wheel on the hind axle will be guided onto a wheel on the front axle second to reduce the friction of the cable on the guides third, to provide means by which the front end of the body or springs of the automobile will rest directly over the front axle

VEHICLE WHEEL.—W L. Howard Trenton. N J In a prior application Mr Howard disclosed mechanism for detachably securing tire-carrying rims to wheels, including curved sections moving circumferentially away from each other and radially to grip the rim The mechanism for spreading apart the gripping sections includes a worm wheel carried by a rotatable rod the opposite ends of which are provided with threads of opposite pitch The present invention utilizes substantially the same general features but provides mechanism for spreading the gripping sections and locking them in position.

Note.—Copies of any of these patents will be furnished by Munn & Co. for ten cents each. Please state the name of the patentee, title of the invention, and date of this paper.

NEW BOOKS, ETC.

The Integrals of Mechanics By Oliver Clarence Lester Professor of Physics in the University of Colorado formerly Instructor of Physics in the Sheffield Scientific School Yale University New York Ginn & Co 1909 8vo, 67 pages with diagrams cloth. Price, 80 cents

The aim of this book is to furnish the conclusion to courses in the integral calculus such as are usually given in colleges and technical schools and at the same time to provide for the beginning of theoretical mechanics, which usually follows the calculus The subject matter is concerned entirely with such applications of the calculus as the calculation of lengths areas, volumes densities centers of mass, moments of inertia and ellipsoids of inertia These subjects are treated in great detail all principles being fully illustrated by examples worked out in the text and by numerous problems set as exercises Since the ground covered is common to both integral calculus and to theoretical mechanics the author hopes in this way to save both time and energy to save time by providing applications of the calculus useful in mechanics to save energy by treating the purely mathematical parts of mechanics entirely apart from the ideas of force and motion This method avoids breaks in the continuity of the mechanics course proper and minimizes the liability of the student to such troublesome confusions as moment of inertia with the moment of a force or center of gravity with the force of gravity Whereas the book is intended strictly as a college textbook and has little interest for those unfamiliar with the calculus it has the additional value of illustrating the practical applications of the latter to those who have commenced its study at college and considered it purely as mental gymnastics

Azimuth By George L Hosmer New York John Wiley & Sons, 1909 16mo 73 pp Price, $1

The purpose of this volume is to present in compact form certain approximate methods of determining the true bearing of a line together with the necessary rules and tables arranged in a simple manner so that they will be useful to the practical surveyor It is a handbook rather than a text book hence many subjects have been wholly omitted which are ordinarily included in books on Practical Astronomy but which are not essential in learning to make the observations described in this book In all of the methods here treated the object sought is to secure sufficient accuracy for the purpose of checking the measured angles of a survey with the least expenditure of time For this reason many approximations have been made and many refinements omitted which simplify the calculations without introducing serious error into the results and although such a treatment would scarcely be proper in a text book the gain in simplicity and convenience would seem to justify its use in a book of this character The methods which are here presented are not new but have all appeared in one form or another in works on Navigation Astronomy and Surveying. Much valuable matter written on this subject is so scattered however that it is difficult to find in one small book all that would be needed by the surveyor in making azimuth observations

Science at Home. Simple Experiments for Young People By P Baron Russell New York R. F Fenno & Co 1909 16mo, 183 pages Price 75 cents

The present volume is an attempt to interest young people in simple physical and chemical experiments. The aim of the book is admirable and the experiments are not beyond the powers of average children

Mission Furniture How to Make It. Part I Chicago Popular Mechanics Company 1909 18mo, 94 pages Price 25 cents.

This little book which is neatly bound in cloth belongs to the Popular Mechanics series of twenty-five cent books It gives a number of illustrations showing how mission furniture can be constructed at home at a small cost The price is so low the book should have a considerable sale

---

INDEX OF INVENTIONS

For which Letters Patent of the United States were Issued for the Week Ending August 10, 1909.

AND EACH BEARING THAT DATE

[See note at end of list about copies of these patents.]

Acetylene burner K Thirnauer	930 74
Acid manufacturing sulfuric W Hallock	930 471
Acids, making J L Tufts	930 442

Legal Notices

PATENTS

INVENTORS are invited to communicate with Munn & Co., 361 Broadway, New York or 625 F Street Washington, D C, in regard to securing valid patent protection for their inventions Trade-Marks and Copyrights registered. Design Patents and Foreign Patents secured

A Free Opinion as to the probable patentability of an invention will be readily given to any inventor furnishing us with a model or sketch and a brief description of the device in question. All communications are strictly confidential Our Hand-Book on Patents will be sent free on request

Ours is the Oldest agency for securing patents; it was established over sixty years ago.

MUNN & CO, 361 Broadway, New York
Branch Office, 625 F St Washington D C

Classified Advertisements

Advertising in this column is 75 cents a line. No less than four nor more than ten lines accepted. Count seven words to the line. All orders must be accompanied by a remittance. Further information sent on request.

READ THIS COLUMN CAREFULLY.—You will find inquiries for certain classes of articles numbered in consecutive order. If you manufacture these goods write us at once and we will send you the name and address of the party desiring the information. There is no charge for this service. **In every case it is necessary to give the number of the inquiry.** Where manufacturers do not respond promptly the inquiry may be repeated.

MUNN & CO.

BUSINESS OPPORTUNITIES

FOR SALE.—Established gas engine business, manufacturing eight sizes of stationary gas engines from 1½ to 25 H. P. Good money maker either as a separate business or as a filler for foundry or machine shop. Full inspection. Good reasons for selling. Worth immediate investigation by promoters of new industries. Address J. C. Wright, Newport, Ky.

Inquiry No. 8898. Wanted to buy nickeloid for buttons.

FOR SALE. Flying machine tubing. 10,000 feet 1¼ x 22 ga. 8 inches long steel tube very stiff, 25 cents each. For further particulars address J. L. Lucas, 3 Fox Street, Bridgeport, Conn.

Inquiry No. 8918. For manufacturers of "Wydt's Electro-Catalytic Sparking Plug."

PATENTS FOR SALE

FOR SALE. Patent No. 920,794. Metal shelf with folding brackets as illustrated in to-day's paper. Now being manufactured and marketed in New York and surrounding States with good results. Rights to distant States can be obtained by responsible manufacturers by applying to The Ideal Mfg. Co., 303 W. 144th Street, New York.

Inquiry No. 8921. For the manufacturers of gilt paper.

FOR SALE. Patent No. 912,577. A sugar beet harvester. Very simple and labor saving. Cuts tops of beet, plows it out, and loads it upon an attached elevator. Patent No. 914,797. A washing machine. Something entirely new. Simple construction. Does not tear up clothes. Both patents sold for reasonable price. Address James Kolin, 2021-51st Street, Chicago, Ill.

Inquiry No. 8922.—Wanted the address of Worthington Boiler Co.

FOR SALE.—Patent No. 925,422. Battery holder. Dry cells can be replaced instantly. No wiring. No binding screws on cells. For full particulars address R. A. Brown, 80 Hodge Street, Buffalo, N. Y.

Inquiry No. 8931. For parties who manufacture the Western Stump borer for boring stumps.

FOR SALE. Patent No. 916,847. An improved automatic street railway and interurban switch. Operated from moving car. Simple and effective. Can be cheaply manufactured. Address Oscar J. Williams, Pittsfield, Ill.

Inquiry No. 8941. For manufacturers of machinery for making fly screens.

FOR SALE. Patent No. 917,751. A new and useful improvement in marine vessels. For further information address H. Oventrop, St. Louis, Mo.

Inquiry No. 8960. For the address of the Windsor Mfg. Co., manufacturers of waterproof collars and cuffs.

FOR SALE.—Patent No. 915,674. Amplifying horn of positive merit. Indorsed by phonograph experts. Unequaled for its clear rich mellow tone. Address F. M. Murphy, 705 Bay St., Jersey City, N. J.

Inquiry No. 8966. Wanted the address of the Cobendlet Motor Co.

FOR SALE. Patent No. 698,590, expiring 1919. Packing for steam stuffing boxes. Used in German navy and commercial service. Not utilized in America. Cheap. Chief Engineer Str. Offenbach, Pier 10, Brooklyn, N. Y.

Inquiry No. 8969.—Wanted machines that make accordion dress plaiting (steam).

FOR SALE.—Patent No. 927,[illegible]. Indispensable household device. Price reasonable. Test sale shows large demand. Royalty considered. Sample on request. Address S. Korndorfer, Ampere, N. J.

Inquiry No. 8977. For manufacturers of machinery for manufacturing denatured alcohol.

HELP WANTED

YOUNG MAN graduate of some school in mechanical engineering for position in a sawworking plant in small Tennessee town. Good opportunity for advancement. State experience if any and salary. Answer Smith, care Box 773, New York.

Inquiry No. 8980. For the address of manufacturers of mortars and pestles that are used by druggists.

MISCELLANEOUS

HAIR GROWS when our Vacuum Cap is used a few minutes daily. Sent on 60 days free trial at our expense. No drugs or electricity. Stops falling hair. Cures dandruff. Postal brings illustrated booklet. Modern Vacuum Cap Co., 512 Barclay Block, Denver, Colo.

Inquiry No. 8984. Wanted the address of the manufacturers of Cypress wash tubs.

TOBACCO HABIT CURED OR NO COST. Harmless home treatment. Ni-Ko Works, Wichita, Kansas.

Inquiry No. 8987. Wanted the manufacturers of the Van Winkle, Woods & Sons and the Weber power meters.

LISTS OF MANUFACTURERS

COMPLETE LISTS of manufacturers in all lines supplied at short notice at moderate rates. Small and special lists compiled to order at various prices. Estimates should be obtained in advance. Address Munn & Co., List Department, Box 773, New York.

Inquiry No. 8990. For information regarding shoes not made of leather but similar to the same and are as durable.

A LIST OF 1,500 mining and consulting engineers on cards. A very valuable list for circularizing, etc. Price $15.00. Address Munn & Co., List Department, Box 773, New York.

Inquiry No. 8996. Wanted addresses of manufacturers of machinery for working orange wood manicure sticks.

Inquiry No. 8997. Wanted the address of the manufacturers of bread or cake boxes.

Inquiry No. 9001. For the address of progressive manufacturers of fruit jars.

Inquiry No. 9007.—Wanted a tin churn for churning milk that has a wire spring at top and bottom of churn and operated by pressing the wire springs.

Inquiry No. 9009. Wanted the address of the manufacturer of the "Leeb" showcard holder, a device which is held to the outside of a show window by rubber cups.

Inquiry No. 9010.—Wanted to buy a "Rector Help-a-Phone."

Inquiry No. 9011. For the manufacturers of a patent sewing needle that is made to slip over the thread; the eye is split so as to open and receive the thread.

Inquiry No. 9013.—Wanted to buy sugar candy boxes in the shape of water melons, colored to resemble melons, etc.

Inquiry No. 9014.—For manufacturers of machinery supplies, etc., to equip a small plant for the manufacture of iridium-tipped gold nib making for fountain pens.

Inquiry No. 9015.—Wanted the address of the manufacturers of a solid link chain made without welding, made in brass, several different sizes, made on an automatic machine.

Inquiry No. 9016.—Wanted, machinery necessary for an installation of a plant for refining salt by a modification of the Bessemer process.

Inquiry No. 9017.—Wanted, the address of manufacturers or dealers in card board plaster or wood pulp for plastering.

Inquiry No. 9018.—Wanted, the address of parties manufacturing gold-plated pens for use in cheap fountain pens.

Concrete
Reinforced Concrete
—AND—
Concrete Building Blocks

Scientific American Supplement 1543 contains an article on Concrete by Bryson Cunningham. The article clearly describes the proper composition and mixture of concrete and gives results of elaborate tests.

Scientific American Supplement 1538 gives the proportion of gravel and sand to be used in concrete.

Scientific American Supplements 1567, 1568, 1569, 1570 and 1571 contain an elaborate discussion by Lieut. Henry J. Jones of the various systems of reinforcing concrete, concrete construction, and their applications. These articles constitute a splendid text book on the subject of reinforced concrete. Nothing better has been published.

Scientific American Supplement 997 contains an article by Spencer Newberry in which practical notes on the proper preparation of concrete are given.

Scientific American Supplements 1568 and 1569 present a helpful account of the making of concrete blocks by Spencer Newberry.

Scientific American Supplement 1534 gives a critical review of the engineering value of reinforced concrete.

Scientific American Supplements 1547 and 1548 give a resume in which the various systems of reinforced concrete construction are discussed and illustrated.

Scientific American Supplement 1564 contains an article by Lewis A. Hicks, in which the merits and defects of reinforced concrete are analyzed.

Scientific American Supplement 1551 contains the principles of reinforced concrete with some practical illustrations by Walter Loring Webb.

Scientific American Supplement 1573 contains an article by Louis H. Gibson on the principles of success in concrete block manufacture, illustrated.

Scientific American Supplement 1574 discusses steel for reinforced concrete.

Scientific American Supplements 1575, 1576, and 1577 contain a paper by Philip L. Wormley, Jr., on cement mortar and concrete, their preparation and use for farm purposes. The paper exhaustively discusses the making of mortar and concrete, depositing of concrete, facing concrete, wood forms, concrete sidewalks, details of construction of reinforced concrete posts.

Each number of the Supplement costs 10 cents.

A set of papers containing all the articles above mentioned will be mailed for $1.80.

Just Published—A BOOK OF INTEREST TO RIFLEMEN

The Bullet's Flight from Powder to Target

The Internal and External Ballistics of Small Arms. A Study of Rifle Shooting with the Personal Element Excluded, Disclosing the Cause of the Error at the Target.

Illustrated with one hundred and eighty-eight plates, showing the results of over three hundred rifle experiments performed and chronologically arranged

By F. W. MANN, B. S., M. D.

Size 7½ x 9¼ inches. 384 Pages. Price $4.00 postpaid

THIS is a thoroughly practical treatise and deals with a subject the literature of which is not commensurate with its importance or interest, and it possesses unusual value not only because it furnishes a large amount of information of a very practical kind, but because this information is the result of a practical experience on the part of the writer extending over a period of thirty-eight years. The results of the author's experiments, as here given, have been persistently and laboriously worked out with an earnest desire to assist his fellow marksmen. In view of the fact that conjecturing and theorizing have been so prevalent in rifle literature, the work has been kept free from speculation, except where they have either been proved to be false or have been fully substantiated by recorded experiments. Most of the illustrations are photographic reproductions of the results of actual tests. Every page is full of interest for the rifle enthusiast. There is a full discussion of various kinds of rifles, of the effect of difference of length, of variations of rifling, etc., as well as of instructive experiments such as that of venting the barrel near the muzzle. An idea of the contents may be gathered from a few of the subjects treated, such as the Personal Element vs. Mechanical Rifle Shooting; Utility of Vented Barrels; High-Pressure Sharpshooting Powder; Telescope Mounts; Ruined Rifle Barrels vs. Smokeless Powder vs. Primers; Accurate Ammunition Difficulties; Flight of Bullets; Gyration and Oscillation; Motions Executed by Normal Flying Bullets; Determining Rifle Twists; Kinetics of Spin, etc. In many respects this work is unique in the literature that has been published on this subject. It is a thoroughly practical work and will be found to be of very real value to those who are engaged in a study of the ballistics of the rifle with a view of improving the all-around efficiency of that weapon.

MUNN & COMPANY, Inc., Publishers, 361 Broadway, New York City

DON'T BUY GASOLINE ENGINES UNTIL YOU INVESTIGATE "THE MASTER WORKMAN," a two-cylinder gasoline, kerosene or alcohol engine, superior to any one-cylinder engine; revolutionizing power. Its weight and bulk are half that of single cylinder engines, with greater durability. Costs Less to Buy—Less to Run. Quickly, easily started. Vibration practically overcome. Cheaply mounted on any wagon. It is a combination portable, stationary or traction engine. Send for Catalogue. THE TEMPLE PUMP CO., Mfrs., Meagher and 15th Sts., Chicago. McIntyre Guaranteed Sure-Service

Model H 12-H.-P. $475

Always-Ready motor buggies and wagons have proved their positive worth as pleasure vehicles and money-saving work vehicles for thousands in every part of the civilized world.

Why Not For You?

McIntyre Motor Vehicles

never fail—never get tired—cost no more than a good horse and buggy—cost far less to keep—do more work in less time than three horses. Take you anywhere and back again over any kind of roads, in all kinds of weather Run 30 miles on one gallon of gasoline Simple, durable, guaranteed mechanical construction. Solid tires — no tire troubles or repair expense. For Free Catalog No. 66 address nearest office.

Model 500, 12-H.-P $495

The Editor is always glad to receive for examination illustrated articles on subjects of timely interest. If the photographs are *sharp*, the articles *short*, and the facts *authentic*, the contributions will receive special attention. Accepted articles will be paid for at regular space rates.

LESSONS OF THE RHEIMS AVIATION CONTESTS.

The series of aviation contests held last week at Rheims must ever stand out conspicuously in the history of man's age-long attempt to achieve the conquest of the air. In speed, duration of flight, and stability under unfavorable atmospheric conditions, the achievements have shown a wonderful advance in the art of aviation. It is safe to say that the most significant feature of the contest—the one which is most prophetic of the future serviceableness of the aeroplane—is the way in which the various aviators dared the elements by bringing out their machines and making some of their best flights when the wind was of a strength which hitherto has been considered prohibitive. It was the unfavorable weather conditions, rather than the distance which he covered, that constituted Latham's spectacular flight of 96 miles at a speed of over 41¼ miles an hour the most remarkable performance since the Wright brothers made that first memorable half-mile flight in North Carolina with a power-driven aeroplane.

For it cannot be denied that the reluctance of the aviator to bring his machine from the shelter of its shed, except in the lightest airs, had shaken the faith of the public in the immediate, if not the ultimate, practicability of the aeroplane. That reckless daring of the Gallic character, which did so much to bring out the inherent high speed of the automobile, seems destined to work a similar result in the even more dangerous field of aeronautics. If the cabled accounts of Latham's flight are not over-seasoned with the inevitable enthusiasm of the moment, the behavior of his machine during the progress of a storm of wind and rain was indeed phenomenal. "For an hour," says the dispatch, "with fluttering wings it fought its way against the storm of rain and wind at an average height of 150 feet, mounting higher as the wind rose, until during the worst of the storm it was fully 800 feet above the spectators." But it was reserved for Farman, driving a biplane of his own design, to establish beyond all question the staying qualities of this type. His official record of 111.78 miles in 3 hours 4 minutes 56 seconds and his total flight of 118 miles in 3 hours 15 minutes has carried the long-distance record beyond the expectations even of the most sanguine.

At the present writing the results at Rheims seem to have established the superiority of the monoplane in speed and of the biplane in endurance. Bleriot with a monoplane holds the record for speed with a time of 7 minutes 47 4/5 seconds for a lap of 6.21 miles, although Curtiss in his beautifully designed and built biplane is a good second with a record of 7 minutes 48 2/5 seconds. The compact little biplane of Curtiss, weighing less than half as much as those of his competitors, won the international cup over a 12.42 mile course in 15 minutes 50 3/5 seconds. Summing up the results, it may be said that the brilliant tournament at Rheims has established three facts: First, that the problem of stability has been solved; secondly, that an aeroplane motor has been produced which will run until the gasoline tanks are empty, and thirdly, that the problem of alighting without injury to man or machine is yet a long way from solution. Regarding this last feature we offer the suggestion that, since the accidents are due largely to the widely extended and delicate wings or planes coming in contact with the ground, a great step toward the perfection of the aeroplane will have been achieved, if some method can be devised by which at the moment of alighting the planes can be thrown upward and backward so as to imitate in some degree the folding of the wings when a bird alights. That the problem would present great mechanical and constructional difficulties, we admit. In a biplane, because of the rigid trussing, it would seem to be impracticable, but it is conceivable that the problem might be worked out in the monoplane.

A SANITARY DRAINAGE CANAL FOR BUFFALO

The Chicago sanitary and ship canal, 22 feet deep, 160 feet wide, and 32 miles in length, which was cut through for the purpose of carrying the sewage of Chicago clear of Lake Michigan and so preserving the purity of Chicago's drinking water, has proved to be a notable success. The city of Buffalo is now seeking permission to cut a similar drainage canal to divert its sewage from the Niagara River and thereby get rid of what is recognized to be a great menace to the inhabitants of the Niagara frontier. This good work is to be accomplished by the creation of certain artificial channels, into which the effluents from all the sewers can be discharged; and it is a fortunate fact that the geographical location of the city makes it possible to do this, by the construction of what is called the Erie and Ontario sanitary canal. It is proposed to draw 6,000 cubic feet of water per second from Lake Erie, reverse the flow in Buffalo River and Smokes Creek, and carry the diverted water to Lake Ontario through an entirely new canal, at a total estimated cost of $30,000,000.

The mean elevations shown on the United States topographic maps for Lakes Erie and Ontario are respectively 573 and 246 feet. Hence the total difference in level between the two lakes is 327 feet. The channel will be so located and constructed as to make the entire head of 327 feet, less a small loss in the necessary slope for flow, available for the development of power. This means that there will be an absolute conservation of the entire natural energy of the water, whereas most of the powers now existing along the Niagara River use less than one-half of the total head between the two lakes. That portion of the work which lies within the city limits will be built by the city itself. The rest of the canal will be built by private capital, and the residents on the Niagara frontier will be given the perpetual right to drain their sewage into the artificial channels thus created. Relief will thus be afforded to the people who live along the Niagara River, and are dependent upon that stream for their drinking water.

The excavation of the canal will commence at the point where Buffalo River crosses the city line on the east, and it will be excavated of sufficient depth and width to stop the crest of the south Buffalo floods by carrying off the waters of the Buffalo, Cayuga, Cazenovia and Smokes creeks. The canal will be constructed below all the railroads that enter Buffalo from the east, and will pass through the divide at Williamsville through a tunnel four miles in length. After emerging from the tunnel it will be continued in open cutting as far as the State barge canal, below which it will be carried by a siphon. Here the two canals will be connected by a lock, through which the traffic of the barge canal can be floated to the freight yard at Gardenville and on to Lake Erie, thus providing a barge canal terminal at Buffalo in addition to that at Tonawanda.

If this ambitious scheme were being promoted simply for the development of the 150,000 horse-power for industrial purposes, which is the estimated capacity of the canal, the chances of securing government consent to the withdrawal of additional water from the Niagara River would be very small indeed, for there is no question that the governments of the United States and Canada, and the people of both countries, are strongly opposed to any further diminution of the flow at Niagara Falls. The hope of the scheme lies in the fact that it will effectually purify the supply of drinking water, not only of the second largest city of the State, but also of the country and towns adjacent to the Niagara River. It is estimated that the construction of the Chicago drainage canal has reduced the high rate of mortality in that city by 51.4 per cent, and similar results may be looked for in Buffalo. Though the SCIENTIFIC AMERICAN has always strongly opposed any further withdrawal of water from the upper Niagara River, we think that the withdrawal of 6,000 cubic feet per second to provide this important city with a pure water supply is a proposition which demands the separate and careful consideration of the Federal government.

WHY DO WATCH MAINSPRINGS BREAK?

Your watch has stopped without apparent cause, and you at once attempt to wind it. The crown turns with a new sense of ease, but the operation is endless. Then you learn that a fickle mainspring concluded to resign its task and, well—simply broke. Why? Here is a query that may stand in the company of "Who wrote the letters of Junius?" "Who was the Man with the Iron Mask?" and other unanswered questions of history. The best mainsprings have maintained their right to break ever since modern watches were invented, and they will do so until some secret of Nature, for which watchmakers are still searching, is revealed. Sudden electrical disturbance of the atmosphere, extreme changes of temperature, or contact with a cold substance will occasionally result in a broken mainspring. Such contingencies are well understood by watchmakers. What is not so well understood is why a spring will sometimes snap in twain or in twenty pieces despite the best of care. You may ascribe it to a fit of temper or to the dog days, or give any other reason that is neither logical nor horological. The fact and the mystery remain. This spring is a piece of tempered steel, usually about twenty inches long, coiled in a barrel between the upper and lower plates of the movement. It is the motive power of the watch. It is made in degrees of strengths, widths, and thicknesses suitable to the watch. As a mainspring is subjected to varying conditions from that of highest tension when fully wound to that of comparative rest when the watch is run down, and as it is constantly undergoing a change in resistance as its coils unfold, it seems to be the only part of the watch, subject to casualties, against which even careful use cannot always provide.

It may be well to state just here that all watches of a given make and size do not properly take the same strength of spring. A variation in thickness of only two one-thousandths of an inch may be the measure of the difference between the right and the wrong mainspring for your watch. Here is the field of the qualified watch repairer. To fit a mainspring requires some deftness, but to fit the proper one demands practical experience and judgment. If your watch is worthy of a spring at all, pay a competent watchmaker a proper charge for a good one.

But the question, "Why do watch springs break?" remains unanswered, and the puzzle is still further complicated when we are informed by one of the largest manufacturers of watches in the world that a sudden spell of hot weather is invariably succeeded by a noticeable increase in the number of complaints of broken watch springs. At first thought this information is puzzling. A sudden drop rather than a sudden rise in temperature would seem to be the natural predisposing cause. Cast metals show greater brittleness at low temperatures under all kinds of stress, and steel and iron, though at low temperatures they show but little loss of strength under static or under gradually applied stresses, show a marked loss under impact or sudden stress.

We can understand the breakage of a mainspring when in very hot weather, the watch is taken from a heated trousers or vest pocket and laid suddenly on a cold marble or iron slab, but how shall we explain the sudden breaking of the spring while the watch is running undisturbed in the pocket? Here is a question which we commend to consideration and discussion by our readers.

THE FIRST VOYAGE OF THE "ZEPPELIN III"

The new "Zeppelin III" dirigible, after a trial flight of over two hours on August 26th, started on a trip from Friedrichshafen to Berlin at 4 A. M. August 27th. The journey was to be made *via* Nuremberg, Leipsic, and Bitterfeld, the total distance in an air line being about 400 miles. After covering 280 miles the airship descended at Nuremberg at 4.45 P. M., to effect repairs to one of the motors and also to one of the propellers. The first descent was made at Ostheim shortly before noon for the purpose of taking on water ballast. The airship reascended at 2.30, and reached Nuremberg, 80 miles distant, in two and a quarter hours, an average of 35 miles an hour. From Friedrichshafen to Ostheim it averaged 25 miles an hour. Count Zeppelin awaited his new craft at Bitterfeld, which point it was expected to reach without a stop. It was his intention to pilot the airship himself from that place to Berlin, where the Emperor was awaiting him.

This new airship has two 150-horse-power motors, and is the most powerful air craft thus far produced.

◆

In a new English gas works it was observed that incandescent gas mantles rapidly diminished in brightness and acquired a brown incrustation, which was found to consist of ferric oxide. By examining the gas at various stages of manufacture it was ascertained that the finished product contained the compound carbonyl of iron, formed by the action of the carbon monoxide of the gas upon the iron pipes through which the gas passed at comparatively low temperatures in the later stages of the process. No iron compound was found in the gas discharged by the retorts and the hottest pipes. Carbonyl of iron is not affected by dilute hydrochloric acid. When the gas is burned the carbonyl of iron is decomposed into iron and carbon monoxide. A few weeks later, the production of carbonyl of iron was found to have diminished considerably. Hence the conclusion was drawn that the interior of the pipes had become coated with tar and naphthalene which protected the iron from the action of carbon monoxide.

[illegible]GINEERING.

[illegible] continue to find favor in Europe. One of [illegible] with a span of 910 feet, is planned [illegible] the Rhine at Koblenz, Germany The [illegible] double tracks will be carried by a steel arch [illegible]er ferry bridge of even greater length [illegible] built at Bordeaux, France, over the Garonne [illegible] the point of crossing has a width of over 1,[illegible]

The [illegible] advancing steadily in size and capacity. France [illegible] recently launched the 'Archimède,' whose [illegible]ment of 808 tons constitutes her the largest [illegible]ble boat afloat. She is 229 feet 8 inches in [illegible] and is driven by twin-screw engines at a speed of 1[illegible] knots on the surface, and 10 submerged. Her [illegible]ing radius is 2,500 miles

In view of the sudden rapid decrease in the freight-car surplus [illegible] the latter part of July and the first half of A[illegible], the American Railway Association considers [illegible]ithin a few weeks there may be a shortage [illegible]. In the second week of August there was a surplus [illegible] 207,178 cars, which represented a decrease of [illegible],000 cars during the preceding two weeks.

D[illegible] 1908, there were 470 boiler explosions [illegible] States, as compared with 471, 431 and [illegible]ely in 1907 1906, and 1905 The number [illegible] killed by boiler explosions in 1908 was 281, [illegible]300, in 1906, 235, and 383 in 1905 During [illegible]ing period since October 1st, 1867 the total [illegible]f boiler explosions was 10 051, in which 15,[illegible] people were injured and 10,884 were killed

One of the most severely used portions of a city street is the row of headers which line the inside edge of car [illegible]y are continually exposed to a particularly [illegible]ding effect from the wheels of drays and [illegible]y horse-drawn traffic A test of iron-slag [illegible]g is being made in the Borough of Rich[illegible]ork where a line of such blocks has been [illegible] the inside of the rails of streets paved with [illegible]ocks They are reported as showing exc[illegible] qualities.

We hav[illegible] referred to the plan by which the United [illegible]ment is now purchasing its coal on the [illegible]ating value, which is ascertained by analy[illegible]les. The new system of purchase applies to [illegible]ildings in Washington over three hundred public [illegible]ings throughout the United States, the navy yards and arsenals and the Panama Canal Already the government has effected a saving of $200 000 on its annual fuel bill of $10,000 000

Improvements in rolling mill plants make it possible to roll in one section I beams of a weight and size which were beyond the capacity of the mills of the last decade. Formerly when an I beam or other rectangular shape exceeded a certain size it had to be built up of plate and angles riveted together The Bethlehem Steel Works which has been rolling unusually [illegible] shapes, has met with such success that Mr Sch[illegible] is about to expend $5,000,000 in the erection of [illegible] furnaces and mills.

At last [illegible]ose two famous single-screw liners, the "Umbr[illegible]d "Etruria' holders of the transatlantic record [illegible] 80s of the last century, have been withdrawn [illegible] service, not because they are by any means [illegible] out, but because they cannot compete in economy [illegible]h twin, triple, and quadruple screw engines of [illegible]ltiple-expansion and turbine type. These two [illegible] contain the largest single-screw marine engines [illegible]built, they marked the close of what might be ca[illegible]he single-screw, compound engine period in the [illegible] of transatlantic travel

Work [illegible] actively in progress on the construction of another mountain railroad across the Andes, this time from La Paz, Bolivia, to Aricas Chili The railroad, which is about 33 miles long, reaches an extreme height of 13,000 feet above the sea, and it will serve the important purpose of giving the commerce of Bolivia a port of exit. Sir John Jackson, of London who has contracted to build the road for $15,000,000, on his way home from Chili, by way of New York, made a private inspection of the Panama Canal. He expressed his conviction that the work would be completed in six and possibly in five years from the present time.

The new Pennsylvania terminal station in New York is rapidly approaching completion, and the last piece of stone in the exterior finish of the station was recently put in place The dimensions of this work are unusually large. The exterior walls are nearly half a mile in length, and they contain 490,000 cubic feet of granite. Adding to this 60,000 cubic feet of stone used inside the concourse, we get a total of 550,000 cubic feet of granite, weighing 47,000 tons, which required 1,140 freight cars to transport it from the quarries at Milford, Mass. Into the construction of the building there have also entered 27,000 tons of steel and 15,000,000 bricks, weighing 48,000 tons.

ELECTRICITY.

The British government is about to lay a telephone cable under the English Channel, to be connected with the present land lines at Dover and Calais. It will be equipped with Pupin coils, and is expected to materially improve communication between London and Paris.

The entire machine shop of the International Harvester Company at Sterling, Ill, is to be operated by electricity, for the generation of which turbines are now being installed The substitution of motors at all the individual machines for shafting and belting is expected to reduce the power cost by one-half.

Many of the railways are arranging to employ telephones for train dispatching, the Northern Pacific having already 470 miles of telephone in service and 250 more projected, while the New York Central will have its whole route to Chicago under telephone control when 300 miles of equipment, in addition to the present 250 upon the Michigan Central is complete

A dressmaking establishment in Boston almost entirely operated by electricity has an electric cutter capable of cutting out 250 thicknesses of cloth at once, a button-sewing machine which puts on 3 000 buttons a day, a buttonhole machine making 400 per hour sleeve sewers, tucking machines waist and skirt machines making 1,800 to 3,500 stitches a minute

A new hydro-electric power station has been completed on the Reedy River in South Carolina. It uses the entire flow of the river of 110 cubic feet per second but has a storage reservoir of 1 600 000 cubic feet capacity retained by a masonry dam Three turbines drive direct-connected generators one of 300 and two of 600-kilowatt capacity delivering 60-cycle three-phase alternating current at 2 300 volts pressure

Prof. Gale of the University of Chicago is slowly recovering from his accident last March at the solar observatory at Pasadena, Cal, when he received a shock of 15,000 volts He appears to have suffered less from the actual shock than from burns from a hot rheostat, upon which he was thrown by the shock and lay for a long time unconscious, but his recovery at all is remarkable and cause for congratulation

The valuable work of the United States Forest Service has called attention, among many other matters to the fact that damage to wooden telegraph telephone, and electric light poles by woodpeckers and similar birds may be prevented by creosoting The value of this process for the preservation of wood both from decay and from fungous growth and wood boring insects is well known It has now been found that of poles of identical wood those which have been impregnated with creosote are immune from attack by birds of the woodpecker family in districts where untreated poles are severely injured

The American Mono-rail Company announces that it will commence the construction of a mono-rail road through Pelham Park to City Island early this autumn Engineers of the Public Service Commission who saw the system in operation at the Jamestown Exhibition say that a speed of 135 miles an hour may be expected over parts of the route where right of way has been granted away from highways so that the train head way may be unrestricted If this line meets with the approval of the public application will be made for permission to operate mono-rail express trains on an upper deck over the present elevated railways in New York

The destruction by fire of the long-distance wireless telegraph station at Glace Bay, Nova Scotia, just as it was completed and ready for service is not merely a serious blow to the Marconi Company, but very much to be regretted by all interested in the advancement of radio-telegraphy The towers and aerials were not damaged, fortunately, and the boiler room and manager's house also escaped, but all the valuable machines had been specially made and cannot be duplicated, while quantities of spare parts for them stored in the burnt-out condenser room were ruined The loss amounts to thousands of dollars, apart from the loss of business due to the station having to stand idle until new machines can be sent from Europe.

The latest machine in which electricity has been substituted for steam power is the steam shovel which from its cumbrous parts, rough usage and irregular loads did not seem a likely appliance to be electrically driven. Two 110-ton machines are used in limestone quarrying by the Dolese & Shepard Company of Chicago, in which the hoisting and the digging movement are controlled by separate motors of 200 and 80 horsepower respectively Each motor is separately controlled by an automatic magnetic switch controller, securing the greatest nicety of operation and protecting the motor from overload due to rock encountered while digging. A feed cable is carried on a reel in the cab connecting at a convenient point with fixed conductor and the shovel moves under its own power It has been found very simple and economical in operation, requiring fewer operators than a steam shovel and eliminating the carrying of coal and water

SCIENCE.

The seventy-fifth meeting of the British Association for the Advancement of Science was opened on August 25th in Winnipeg with six hundred delegates present from the United Kingdom, the United States, and Canada. The twelve sections of the Association remained in session for a week One of the principal addresses was delivered by Sir J J Thomson, the president of the Association and is published in the SCIENTIFIC AMERICAN SUPPLEMENT

Capt. Rowland V Webster F R G S is to head an expedition of the Royal Geographic Society to the South Pole He expects to employ an aeroplane or some form of flying machine in making the final dash, and to follow the route taken by the German expedition a few years ago

An effort is to be made to stock the Hudson River as well as other northern rivers of the United States with sturgeon a fish that once swarmed in their waters, but which has since been exterminated The proposal comes from Mr Horace G Knowles formerly American Minister to the Balkan States. Through Mr Knowles's efforts the Roumanian government has promised a carload of sturgeon fry some cans of young sterlet, and smaller food fish to populate our waters. The first consignment of several hundred thousand fry will probably be planted in the Delaware River The native sturgeon have been all but exterminated by wastefulness.

The ancient Romans excelled in making pottery They possessed regular muffle ovens and even a sort of producer gas oven Attempts to produce the beautiful soft gloss peculiar to old Roman pottery have not yet attained complete success. The best result is obtained by Fischer's mechanical process, in which the ware, before it is fired is coated with a paste of clay and pigment and is then polished Fine imitations of ancient pottery are thus produced but the study of defective portions of the genuine *terra sigillata* ware shows that it was made by a different process the gloss having evidently been produced by the application of a superficial glaze without mechanical polishing

Stoklasa has published the results of experiments in inoculating soil with nitrogen fixing bacteria which possess great power of assimilating free nitrogen and are retarded in development by nitrates in the soil The radio-bacteria on the other hand decompose nitrates, and liberate nitrogen which is voraciously consumed by the azotobacteria The results of the experiments show that inoculation with nitrogen fixing bacteria increases the crop and improves its quality, provided that care is taken to supply the carbohydrates potash and phosphoric acid which these bacteria require for their growth and to neutralize the free acids of the soil by applying lime in liberal quantities

Ozone is the best agent for purifying water because it adds nothing except oxygen which assists in aeration An ozonizing plant has recently been installed at Saint Maur near Paris where the water of the Marne River was found to contain many disease germs even after it had passed through sedimentation basins and sand filters The ozone generators are of the Siemens type and are operated by a high tension alternating circuit obtained by transforming the current of a 110-volt alternator which is driven by a 44 horse-power steam engine The total consumption of energy is 1 kilowatt hour for each 1 200 cubic feet of water and more than half of the energy is employed in working the compressing pumps The cost of sterilization is less than 5 cents per thousand cubic feet The temperature of the water is lowered by the operation and not a trace of nitrous oxide chlorine compounds hydrogen dioxide or metallic salts due to corrosion of the apparatus can be detected in the sterilized water Of the ozone absorbed, 73 per cent is consumed immediately in sterilization 7 per cent remains diffused through the water and exerts a subsequent sterilizing effect and 20 per cent escapes into the atmosphere

Walter Wellman's second attempt to sail over the North Pole in a dirigible airship was made on August 15th, and proved a failure The airship met with a mishap about thirty two miles from the starting point. The leather guide rope to which was attached a thousand pounds of provisions and stores, broke away Relieved of this great weight the airship shot up to a great height but the pilot succeeded in bringing it down to earth and in turning it homeward against a strong wind No one was injured The airship has been described in these columns in detail for which reason it is hardly necessary to discuss its construction at length Although the attempt was a failure it must be admitted that while aloft the craft was maneuvered with ease That it was brought to earth after its swift upward rush, and safely landed speaks well for the power of its engines. Mr. Wellman has been working for four years to carry out his idea of reaching the North Pole by an airship His aeronautical idea is the result of two expeditions by sledge and boat into the polar regions.

A NEW SPEED INDICATOR FOR MARINE PROPELLERS

When the steamship Perry G Walker collided with the lock gates at Sault Sainte Marie causing the wreck of two other steamers and doing damage to the locks which required weeks for repair the captain stated under examination that he had signaled to his engineer to go astern but that his signal had somehow been misunderstood and the engines had started full speed ahead Such an accident is conclusive and incontrovertible evidence of the need of a reliable system of indicating the direction and speed of rotation of the propellers of vessels. It is but one instance of a number of marine accidents occurring annually from either the incorrect interpretation of signals given to the engine room from the bridge or the execution of signals given by the bridge which owing to mental stress from impending accident are incorrectly given It is always extremely difficult for a board of inquiry to determine just with whom the error lies

In the above instance it is claimed by the captain that the correct signals were given but instead of the engines being reversed at the critical moment they were sent ahead and before the error was discovered such headway had been gathered by the vessel as to preclude all hope of stopping her within the limited lock space

There is no question of the importance of enabling the captain and pilot to be at all times familiar with the interpretation and execution of signals Errors are thereby immediately discernible and correspondingly corrected before damage is done

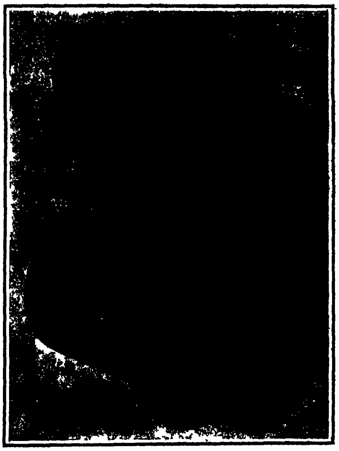
In the absence of a tachometer to show at a glance the rate in revolutions per minute at which the propeller shaft is turning signals are executed by the engineer according to his best judgment For instance the execution of half speed astern may vary eight or ten revolutions per minute and the pilot depending upon a speed-checking effect may be thrown off in his calculations by too slow a rate of turning of the engines

When equipped with a tachometer system however the signals can be obeyed at an exact predetermined propeller shaft speed with corresponding increased accuracy and efficiency of handling the vessel Warships in line or column formation must correctly execute the orders of the flagship setting their speed to conform to the desired headway between ships quickly and accurately Otherwise a collision is probable

The absence of an accurate and dependable tachometer up to the present has made it necessary to arrive at the revolutions per minute by noting the turns successively by the revolution counter for preferably at least a half minute If the speed of the shaft is too high a rough guess must be made as to how much the throttle is to be closed and another counting gone through All this takes time and is on too much of a cut and try system With a tachometer to guide him the man at the throttle has but to operate the throttle until the pointer of the tachometer rests on the desired R P M

Range finding for the accurate sighting of the guns includes the determination of the distance of the object to be fired at angle at which the warship is approaching or receding from the target, and the speed at which the vessel is traveling

The first two factors are quickly and accurately determined by means of the modern range finder in the hands of skilled men, located on the masts or range towers of the warship This is telephoned to the fire control sub-station It then becomes imperative that the rate at which the engines are turning over at that instant be immediately determined in order that the proper instructions may be telephoned at once to the turrets The sooner the discharge of the projectile is effected after the range has been determined the more accurate is the aim and the greater the execution done



A NEW SPEED INDICATOR FOR MARINE PROPELLERS.

In these calculations the effect on ship speed by propeller speed taking into consideration the extent and direction of wind and tide is quickly and accurately calculated

Relation between ship speed and propeller speed is frequently calibrated with due reference to increased fouling of the ship's bottom from marine growth and is immediately available Even when the engine-room forces are endeavoring to maintain an exact prearranged speed of rotation this speed often varies owing to the absence of accurate deadbeat tachometers for indicating at all times the rate of revolution

Aside from the strategic advantages of a tachometer for indicating engine speed of rotation the economic

POWERFUL ELECTRIC HOISTING AND CONVEYING MACHINERY.

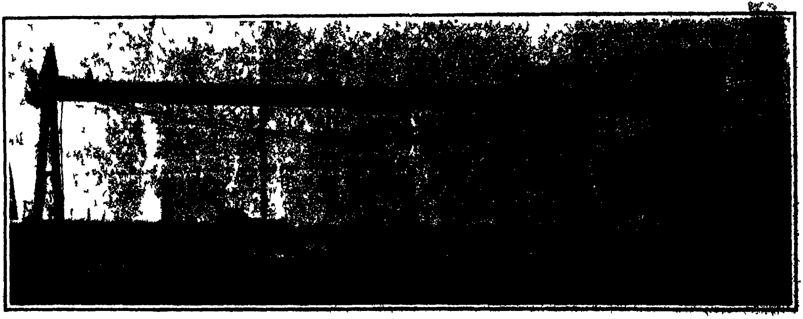
Nowhere in the field of mechanical engineering has American ingenuity in the design of [illegible] plants been shown to more striking [illegible] than [illegible] great hoisting and conveying plants, which are such a prominent factor in our modern constructive and industrial operations. The rapid and cheap raising, removal, distribution and deposit of materials in large bulk is one of the most serious problems of the day, and it is the ingenious solution offered by American hoisting and conveying apparatus that has enabled our engineers to dig canals, build embankments, handle enormous loads of coal, iron ore, wheat, and corn with an economy undreamed of in an earlier day We present illustrations of a powerful electric bridge tramway designed and erected by the Brown Hoisting and Machinery Company for the Michigan Alkali Company which is an excellent example of the type of machinery above referred to.

The bridge which is designed to handle the limestone in the stock yard of the company has a span of 256 [illegible] center of pier to center of shear [illegible] center depth of 17 feet, and the [illegible] of the structure is 286 feet [illegible]. The height from top of rail [illegible] at the shear is 59 feet 9 i[illegible] the pier 61 feet 9 inches the [illegible] level To the bridge span an[illegible] is attached a runway carry[illegible] trolley arranged to handle [illegible] a two-rope grab bucket or a scraper bucket

The pier consists of two specially designed shear legs mounted on a portal structure arranged to straddle ove[illegible] of railway track The two shear legs are joined together at the top by a [illegible] connection, designed to carry the bridge structure By this arrangement a free [illegible] is allowed for the passage of the [illegible] through the pier support The st[illegible] of the pier throughout is of medium open-hearth steel The portal or lower portion of the pier consists of two pairs of [illegible] latticed together by girders and braces and arranged to carry a bin for the rec[illegible] distribution of the limestone The lower portion of the portal is mounted on four two-wheel equalizing trucks These wheels are connected by bevel and spur gears to the driving machinery in the house on the bridge The shear-leg support is of A-frame construction mounted on two-wheel equalizing trucks arranged to run on a single line of rail At the top of the shear is a ball bearing upon which the main bridge is hung The track wheels are connected with the moving gear in the engine by bevel and spur gears

The bridge span consists of two parabolic pin-connected trusses supporting the cross beams from which the track stringers are suspended The bridge span is supported on the pier support by roller bearings, and held in place by a vertical center pin. At the shear support it is hung from a ball and socket connection in such a manner that the bridge may be skewed in either direction from its normal axis, so as to give an angle of one foot crosswise in nine feet lengthwise of the bridge span The moving gear is operated from the main operating mechanism located

(*Continued on page 169*)



Length over all, [illegible] feet [illegible] inches depth of trusses, 17 feet; height of bridge above ground, [illegible] feet 9 inches.

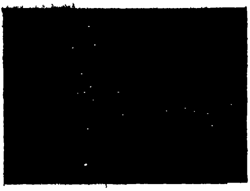
Hoisting and conveying machine; capacity [illegible] tons per hour

POWERFUL ELECTRIC HOISTING AND CONVEYING MACHINERY.

[illegible] OF THE HEAVENS

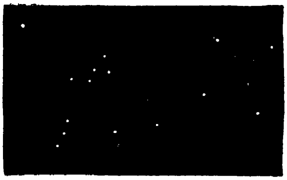
[illegible]

The [illegible] astronomer who takes delight in contemplating the starry skies, is as familiar with the constellations as he is with the continents and islands of the terrestrial globe He rarely thinks of them however, with regard to the images they are supposed to represent but finds them by means of the quadrangles, triangles, circles, etc by which they are distinguished, and by means of their relative positions Rarely does he realize how long it took for the stars to become systematically classified and the constellations mapped out as they are to-day The skies as we know them owe their arrangement to the Greeks and the Arabians

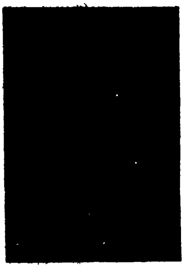


Boötes and the Crown

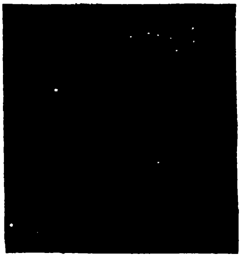
The Great Bear and Cassiopeia



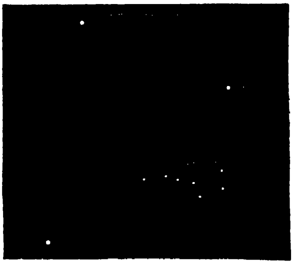
The Great Square of Pegasus



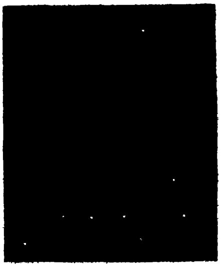
Orion, Sirius, and neighboring stars.



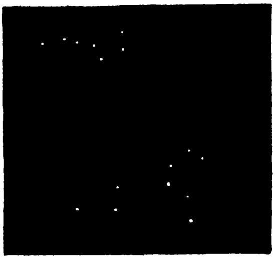
Virgo and the neighboring constellations.



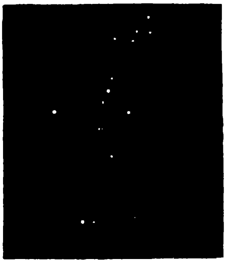
The constellation of Lyra



The Great Bear and Pole Star



The Great Bear and the Lion



Perseus and its neighboring stars

HIEROGLYPHS OF THE HEAVENS

The first reliable information regarding the Greek sky is obtained from Eudoxus of Cnidus an astronomer who lived about 370 B C His work furnished Aratus, who lived a hundred years later with material for his great astronomical poem The Romans read this in many translations, one of which was by Cicero Instead of Hercules Aratus gives the figure of a kneeling man with outstretched arms called the Kneeling One Above him stand Ophiuchus holding the Serpent, under whose coils Boötes, the Ox-Drover is seen with the brilliant Arcturus under his girdle The other constellations of Aratus are Auriga, the Waggoner, carrying on his left shoulder the goat that nourished Jupiter, and on his wrist a kid, half the body of Pegasus with his wings, the chained Andromeda menaced by the sea monster Cetus (now the Whale); the King Cepheus, Cassiopeia in her chair, the kneeling Bull with the Hyades and the Pleiades the Eagle Dolphin Wolf Centaur the Water Serpent winding across the sky with his head under the Crab and his wreathed body under the Lion and bearing on his body a cup out of which a crow seems to drink and Orion with his dog Sirius here not a star but representing the whole constellation of Canes Major His body is dark says Aratus but a star on his jaw sparkles with more life than any other star

Beneath Orion is the Hare which he is hunting and behind the Dog the Ship Argo sails The Tortoise found by Mercury and converted by him into a lyre here appears with the Lyre on his head and the Swan is described as spreading its pinions in gentle flight and sinking down perpendicularly into the western horizon with its right wing turned toward Cepheus s right hand and its left to the Horse s foot.

The Manger and the Asses are also mentioned and all the signs of the Zodiac.

In great numbers says Aratus and in various courses the stars incessantly move around the motionless skies The axle stands immovable In the midst the earth is suspended in equilibrium while the heavens swing around it The poles bound the axle on both sides These are encircled by the Bears that revolve around back to back separated by the Dragon s manifold coils."

Eratosthenes (about 70 B C) enumerates these constellations and not only tells the mythological stories but indicates the positions and numbers of stars in every figure. He differs from Aratus only in a few particulars the Centaur he calls Chiron gives the Wild Goat and Altar other names introduces Berenice s Hair and speaks of Aquarius s stream of water and the Thyrsus wand of the Centaur

Equuleus the Little Foal of the southern hemisphere seems to have been introduced by Hipparchus (160-125 B C) who compiled a catalogue of a thousand stars with their latitudes and longitudes

Ptolemy (130 150 A D) who extended many of the theories of Hipparchus in his great work to which the Arabs gave the name of Almagest gave forty-eight constellations The figures were the same as the old constellations of Aratus with a few additions The stars however were marked in their proper places and defined as to latitude longitude and magnitude

After Ptolemy a long period ensued during which the astronomical charts were unchanged It is to the Arabs in the eighth century that the next advance is due The Caliphs of this period among whom was Haroun al Raschid of Arabian Nights fame were friends to science and gathered around them men of learning such as the famous astronomers Ulug Bekh Fergani El Batan and Abdelrahman Sufi To a great extent they were satisfied with Ptolemy s work to which they gave the name Almagest and although they retained a great many of the Greek star names they added a number derived by tradition from the ancient Arab names Abdelrahman Sufi wrote a detailed and exhaustive account of the Greek constellations carefully following Ptolemy and at the same time he treated of the ancient Arabian heavens

This great mass of uncharted Arabian folk lore is extremely picturesque. The stars in the vicinity of the North Pole are supposed to represent a shepherd, who with his dog is pasturing a herd of sheep. To this group belong also two calves, three goats, four camels and a foal These animals are all in the neighborhood of Cepheus. A single camel (one star in Draco) has strayed away to pasture alone Two jackals and several hyenas are prowling around the herd with wicked intentions. The small stars in the region occupied by Hercules indicate another meadow where another shepherd pastures his flock, and the long row of stars (in Hercules and Serpens) are fences protecting the sheep from the hyenas and jackals. The other side of the meadow is protected by the shepherd's two dogs Many other shepherds with flocks of sheep and camels are scattered through the heavens, and amid these meadows runs a River (the Milky Way), which affords refreshment to various camels, sheep, and ostriches, some of which are in the act of drinking or going to or returning from the River, each represented by stars more or less close to the broad luminous band The oval ring which we know as the Southern Crown is the Ostrich Nest, near which two pairs of Ostriches are supposed to stand Another Ostrich Nest is situated in Eridanus, near which a number of small stars indicate male and female ostriches, young birds eggs, and broken egg shells. Five yelping dogs are marked by five stars in Virgo, a pair of birds by two stars in Sagittarius two frogs by a star in Pisces Australis and one in Cetus, four monkeys by four stars in Ursa Major, and two ravens by two stars in Columba Near Ursa Major and Ursa Minor are a gazelle and its young Three pairs of stars (below the feet of the Great Bear) are the footprints of several gazelles, which, according to the story sprang from that spot when the Lion also in the vicinity lashed the sky with his tail and which is now pursuing these gazelles, some of which have jumped for safety into the great Pond (a group of stars in Ursa Major)

We also find in the Arabian Heavens a Tent (three stars near Auriga), a Traveling Tent (near the Southern Crown), a Pot (a ring of stars in Cepheus and Cygnus), a Beggar's Dish with nicked rim (the broken circle which forms the Northern Crown), a Boat (in the Phœnix), a Manger (in Crater), a Dyed Hand (in Cassiopeia), a Mutilated Hand (in the head of Cetus), and Pearl Necklaces, Brooches, and Crosses are scattered in various parts of the sky The quadrangle of the Great Bear forms the Bier, followed by three mourning women poetically called the 'Daughters of the Bier" These three stars are what we call the tail of the Bear

In many instances as will have been noticed the imaginary figures are not composed of a group of stars, but of a single star Some individual stars, too, are of great importance, the three bright ones that form Orion's belt are the Three Kings, one in Andromeda is the Red Speckled Magpie one in the Great Bear, the Black Horse, belonging, perhaps, to the neighboring Emir and around the North Pole circle the Dancers. Besides these the Arabs have a great many stars with such vague names as the Forgotten, the Touchstone, the Isolated the Dim-eyed, etc

So strong was their objection to the personal element, that when the Greek Zodiac was incorporated by the Arabian astronomers they indicated the names of the objects carried by the characters instead of the characters themselves. Thus Virgo was called the Ears on account of the wheat she held in her hand Sagittarius was not the Archer but the Bow, and Aquarius, not the Water-Bearer, but the Well Bucket.

When the great mixture of Arabian folk lore was combined with the Greek sky many of the star names were retained but occasionally the Greek names were changed, for instance the beautiful red Antares in Scorpio was appropriately called the Scorpion's Heart

The Pleiades.

Castor and Pollux.

HIEROGLYPHS OF THE HEAVENS.

In 1433 Ulug Bekh made at his observatory in Samarkand the most correct catalogue of stars up to that period The famous astronomical tables compiled under Alphonso X of Castile date from 1252, and next in importance was the great catalogue of Tycho Brahé (1546-1601) In this occur two new constellations, Berenice's Hair and Antinous, which Ptolemy mentioned in speaking of the 'informæ' of the Lion and the Eagle. Berenice's Hair was erased by Bayer who depicted in his "Uranometria" (1603) an authority for many years, a Sheaf in its place Subsequently Berenice's Hair was replaced

Two new figures occur in Jakob Bartsch's 'Planisphærum' (1624), the Tigris and the Jordan which were repeated for many years on the French maps and globes, and are mentioned in a book by A. Royer (1679) in which a constellation in honor of Louis XIV was introduced This was the Scepter and the Hand of Justice, and was placed immediately over Sagittarius in the Milky Way After the death of the grand monarch, it suddenly disappeared from the globes, its place being taken by the Lizard which originated with Helvetius. In Royer's book the Lily from the old French coat-of-arms occurs in the spot occupied by the Fly A similar liberty was taken by Thomas, in his 'Firmamentum Firmianum" (Augsburg, 1731), where he changed the Northern Crown to "Corona Firmiana,' a device ornamented with two stag-antlers from the German coat-of-arms.

The southern hemisphere, which was uncharted by the ancients, is of far less interest than the northern, partly because the changes have been frequent and unimportant, and partly because the only constellation visible to us is the Dove introduced early in the sixteenth century In the old books it is called Columba Noæ because it is near the ship, represented sometimes at that period as Noah's Ark The regions around the Ship and the North Pole have been subject to the most frequent changes since the seventeenth century For a time the Cock was formed at the expense of the Ship, which however, was soon restored Halley introduced in his 'Catalogus" (London, 1678) the figure of an Oak between the Ship and the Centaur, to represent the tree in which the King of England was hidden for twenty four hours after Cromwell won the battle of Worcester (September 3rd, 1651) Helvetius and Flamsteed accepted this new constellation, but La Caille complained that Charles's Oak was formed out of some of the finest stars in the Ship and ruined this constellation Therefore he left it out of his charts Bode however used it. Halley also introduced another figure—the Heart of Charles the Second—which was finally adopted on all the modern charts and globes. It consists of a single star of the third magnitude on the collar of the Southern Hunting Dog

Vega, the Swan, and the Eagle.

Camelopardus is a young constellation, and was placed in the space between the Pole Star and Auriga about 1624 This is the only figure that remains of the many that were here among which were the Reindeer introduced by Le Monnier when he returned from Lapland, between the Pole Star and Cassiopeia, a Harvest Keeper, between Cepheus, Cassiopeia, and Camelopardus formed by Lalande when the comet of 1774 passed through that unclassified region and named by him for the astronomer Le Messier, who put it on his globe of 1780, and a third figure, formed by Bode as a memorial to King Frederick II called Friedrichs-Ehre consisting of seventy-six stars between Cassiopeia, Cepheus, Andromeda, and Cygnus The figure includes sword, pen, and olive branch laurel wreathed

In 1624 the Fly was made out of the "informæ" of the Ram, and the Unicorn was placed between the Great and Little Dogs.

Helvetius is responsible for the Hunting Dogs (Canes Venatice) which run before Boötes; Mount Mænalus, below Boötes, Cerberus in the left outstretched hand of Hercules, the Fox and Goose in the Milky Way, near Sagittarius, the Lizard, near Andromeda, the Sobieski coat of arms, above Sagittarius, the Lynx, between the Great Bear and Hercules; the Little Lion near the Great Lion, and a small Triangle and Sextant. These were published in 1690 after his death and were accepted.

Early in the seventeenth [illegible] was made to substitute Biblical names [illegible] those of classic myth and legend. [illegible] for example, published in 1627 a [illegible] popes, martyrs, and persons from [illegible] New Testaments were figured in rich co[illegible] in the style of the illuminated manus[illegible] Middle Ages. Christ was represented as [illegible] and the planets revolving around him were [illegible] instead of Saturn; Moses, Jupiter; [illegible] John the Baptist, Venus, Elijah, Mercu[illegible] Virgin Mary was substituted for the moo[illegible] with Goliath's head was placed on the ma[illegible] of Perseus with the head of Medusa, Samso[illegible] the jawbone of an ass, instead of Hercules[illegible] on which Christ rode to Jerusalem instead of [illegible]; Noah's Ark for the Ship Argo; the Cross [illegible] Swan; the dog of Tobias instead of the Gr[illegible] Dog, etc. The signs of the Zodiac were named [illegible] Apostles the Ram became St. [illegible] St. Andrew, the Twins, St. John, [illegible] the Evangelist, the Lion, St. Tho[illegible] Virgin, St. James the Less, the Scales, [illegible] the Scorpion, St. Bartholomew, the [illegible] Matthew; the Goat, St Simon, Aqua[illegible], and the Fishes, St. Mathias.

In the latter part of the same [illegible] attempt was made by Weigel, w[illegible] the coats of arms of various famili[illegible] and other devices in his "Cœlum H[illegible] 1688), where we find the Brand[illegible] in place of the Eagle, the Elepha[illegible] in place of the Great Bear, a Cardi[illegible] of the Scorpion, the double-headed [illegible] Eagle for Orion, etc. Flamsteed's "Sky Atlas," corrected by Bode (Berlin, 1782), gives two new constellations the Brandenburg Scepter near Eri[illegible] Poniatowski Bull, named in honor of th[illegible] near the Eagle including the Hyad[illegible] of all the constellations is the Cat, in[illegible] between the Cup and the Ship in [illegible] century After Napoleon's death so[illegible] to place him in the heavens in [illegible] but his figure appears in no map of t[illegible]

The accompanying illustrations [illegible] from Sir Robert Ball's "Story of the He[illegible]

The Current Suppl[illegible]

The opening article of the curre[illegible] No. 1757, deals with the railway-car f[illegible] Germany and Sweden, and describes [illegible] the vessel called the "Drottning Victo[illegible] Mr. A. [illegible]'s excellent article on imitation arms [illegible] concluded In 1911 Rome is to be the [illegible] celebration of the fiftieth anniversary of the pro[illegible] of the Italian kingdom For that reason [illegible] article on Old and New Rome seems peculiarly a[illegible]. The paper read by Prof Harold A. Wilson [illegible] the Royal Institution on the Electrical Properties of Flames is summarised Mr Percy Collins contributes an article on Ants and Bees as Pets. Mr Snowden B. Redfield prophesies that in a few years a [illegible] who desires to call another over the telepho[illegible] not only make all the electrical connections [illegible] but will deposit his money in an automatic [illegible] talk as long as he likes, and then have his ch[illegible] automatically handed back to him This p[illegible] he bases upon the [illegible] performances [illegible] automatic telepho[illegible] central, which is de[illegible] at length Mr A[illegible] Watson contributes [illegible] taining article [illegible] Old Conjurers' [illegible] and Utterances. [illegible] of the most brillia[illegible] read before the [illegible] Association for [illegible] Advancement of Sc[illegible] at its Winnipeg meeti[illegible] was that of Sir J J. Th[illegible]. In the current Supp[illegible] will be found an abstract of that paper, entitled "Studies of Electricity and Matter"

Swarms of bees are sometimes compelled to take refuge in very remarkable shelters. A peculiar and instructive instance was observed by the writer in the spring of 1908 The swarm flew over a large vineyard which contained few buildings. One of these buildings was constructed of hollow concrete blocks. The swarm flew directly toward a small hole in one of the blocks and disappeared in the interior No doubt the swarm had rested on a tree or shrub on the preceding day and had sent out scouts to seek a home. The scouts found the little hole leading into the great cavity of the concrete block, and reported their discovery to their comrades. This case furnishes indisputable proof that swarming bees really send out scouts, as they are believed to do, for the little hole could not have been discovered in the rapid and lofty flight of the swarm.

THE AVIATION MEETING AT RHEIMS

The first real aviation meeting held anywhere in the world took place last week near the city of Rheims, France. The Betheny plain, which is several miles in length and a mile or more in width, was the scene of a triumph of aeroplanes such as even the most enthusiastic aeronauts did not believe possible. Not only were all records broken, but new ones were set up which are far in advance of the supposed state of the art at the present time

Altogether there were thirty-eight aeroplanes entered for the various contests and races, for which $40,000 in cash prizes were offered The machines which made flights were divided about equally between the monoplane and the biplane types, although the latter type was rather more in favor Of the machines of this type, five were Wright biplanes, five biplanes of the Voisin cellular type with a tail, and three of the Farman type with a tail but without vertical partitions between the main planes. The Curtiss biplane represented America.

The monoplane type of flying machine was represented by three Antoinette machines, two Bleriot, and three Pelterie.

The course over which all the contests took place was a rectangular one, the total distance around it being 10 kilometers (6.21 miles) The judges' and timekeepers' stand was in the middle of one of the short sides, just opposite the grand stand. A row of aeroplane sheds was placed at one end of the grand stand.

The first day of the meeting, Sunday, August 22nd, was given up to trials of the machines entered in the International Cup Race for the Bennett trophy On account of the seventeen entries, elimination trials were required in order to select three contestants to represent France in the race

As there had been rain the preceding day and also early Sunday morning, and as the wind still continued to blow at the rate of about 12 miles an hour, the weather conditions were not propitious for the first flights. Soon after 10 A. M Monsieur Maurice Guffroy attempted to get off the ground with his red winged "R.E.P" (Pelterie) monoplane, but on account of the sodden condition of the earth, he was unable to rise in the air M Paul Tissandier was the next to make an attempt. He had a Wright biplane, and as this starts from a rail, he had a distinct advantage over M Guffroy It was with considerable difficulty, however, that everything was put in readiness about the starting apparatus in the fifteen minutes allowed for making a start. Then, too he had trouble with his motor Finally, however, he got away just as the time was up The machine rose and made a two-minute flight, during which all the skill of the aviator was required to keep it right side up At length it was caught by a stronger gust than usual, which caused it to make a dive. M Tissandier stopped the engine and glided to earth Thus was eliminated the second entrant for the International Cup Race.

M. Hubert Latham was the next one to attempt a flight with his powerful Antoinette monoplane He rose in the air readily but when once aloft the strong wind gusts caused his machine to pitch and roll in an alarming manner After covering about a kilometer he quickly descended, landing safely In a second trial later on, M Latham qualified by making two rounds of the course (20 kilometers or 12 4 miles) in 18 minutes and 33 seconds. No sooner had M Latham descended than M. Louis Bleriot rose in the air in his No 22 monoplane fitted with a 45-horse-power Anzani motor But even this skillful aviator had difficulty in keeping his monoplane on an even keel in the wind which was blowing. He covered the course once, and was making his second round when a sudden gust drove his machine earthward and damaged the tail in alighting. He had covered sufficient distance to be appointed one of France's representatives in the International Race.

Capt. Ferber, who flies under the pseudonym of De Rue, made a short flight with his Voisin biplane He came very near running into a barricade opposite the grand stand. M. Lefebvre, with a Wright machine, succeeded in starting during a calm moment. He made a round of the course in 8 minutes and 8 1-5 seconds, and although he was obliged to descend during the second round, and after covering but 16 kilometers (10 miles) on account of the wind, he was appointed as the third representative in the cup race. M. Tissandier afterward made two rounds in 19 minutes and 26 seconds, and was appointed as a reserve pilot. M. Latham, on the "Antoinette II.," made two rounds in 19 minutes and 44 1-5 seconds. M. Paulhan made two rounds with his Voisin biplane in 21 minutes and 4-5 second, and M. Sommer in 23 32. Thus, although six reserve pilots were allowed, only three—Tissandier, Paulhan, and Sommer—were appointed.

As the weather cleared in the afternoon, and the wind ceased entirely, ideal conditions prevailed toward the end of the day, with the result that almost all the aviators brought out their machines and made flights before evening. At 6 o'clock no less than five aeroplanes were flying simultaneously around the course, and the sight was one never to be forgotten M. Lefebvre on his Wright machine performed the most daring feats, besides describing circles and figure eights, he would rush at the grand stand, and then quickly turn to the left and avoid it. M Paul Tissandier and Count de Lambert made excellent exhibition flights upon their Wright aeroplanes The latter at one time flew past M Bunau Varilla on his Voisin biplane, going below him and thus reversing Mr Curtiss's maneuver of the day before, when he passed above M Latham when flying at right angles to him

The results of the first day's attempt to cover one and three circuits of the course (10 and 30 kilometers, or 6 21 and 18.63 miles) in the speed tests, were as follows

	3 Rounds.	1 Round
Tissandier (Wright biplane)	28 59 1/5	9 26 1/5
Count de Lambert (Wright biplane)	29 02	9 33 2/5
Lefebvre (Wright biplane)	29 02 1/5	8 58 1/5
Latham (Antoinette monoplane)		9 47 4/5
Paulhan (Voisin biplane)		10 50
Bunau-Varilla (Voisin biplane)		13 30 1/5
Sommer (Farman biplane)		11 24 2/5
Cockburn (Farman biplane)		11 44

The following day, Monday, Mr Glenn H Curtiss covered one round of the course in 8 minutes and 35 2/5 seconds. He succeeded in lowering this to 8 minutes and 11 3/5 seconds on Wednesday although he was not able to equal M Bleriot's record of 8 minutes and 4 2/5 seconds (46 15 miles an hour), made Tuesday by this aviator with a new monoplane fitted with an 80-horse-power motor The third day of the meeting was notable on account of a visit paid by the French president M Fallieres, who inspected all the machines and showed great interest The first flight this day was made by Bunau Varilla who flew in a breeze of 15 miles an hour, which caused his Voisin biplane to rock dangerously He made one circuit of the course Next M Paulhan made a flight, rising first to a height of about 100 feet and afterward to between 300 and 500 feet. On the back stretch he raced a train for some distance, overtaking and passing it. Despite the strong wind, which caused the machine to pitch and lurch he made the first round in 12 minutes and 13 seconds. After completing three rounds of the course he made a sudden descent and a wide curve, but righted his machine when near the ground, and passed the grand stand on a level keel, making a couple of wide circles in front of it before he alighted As an exhibition of daring his flight in the 15-mile wind at such a great height stands unprecedented The time of his three rounds was 38 minutes and 12 2/5 seconds M Paulhan's performance indicated that he might yet do greater things, and it was only the next day that he succeeded in breaking all endurance records. On Wednesday, August 25th, he remained in the air 2 hours 43 minutes, 24 4/5 seconds. He covered a distance of 134 kilometers (83¼ miles) After several other aviators had made short flights, M Paulhan started about 4 P M in a wind of about 6 miles an hour, and circled the course continuously, notwithstanding that the wind blew at times as high as 24 miles an hour While the speed of the machine was only about 30 miles an hour, it was remarkable for the ease with which it flew in the wind and for the steady running of the motor This motor is the Gnome revolving-cylinder 50-horse-power engine, consisting of seven cylinders which spin around a fixed crank. The propeller is attached to the cylinders, which revolve in a vertical plane, the motor being placed in the rear of the lower plane

M Paulhan had already made several lengthy and excellent flights with his biplane, but that on the 25th ultimo is by far the longest, exceeding Wilbur Wright's 2-hour and 20-minute record by 23 minutes The first round of the course was made in 12 minutes and 16 seconds. During the sixth round the wind increased to such an extent that M. Paulhan was blown inside the course, and in order to turn the pole at one corner he was obliged to describe a complete circle After alighting, when his gasoline gave out at 7 30, he had the tank refilled, and then flew from the point where he came to earth across to the grand stand He received an ovation from the spectators. M Paulhan's flight was for the Grand Prix de la Champagne, the prize for which is $10,000 to the winner

Another aviator to make his appearance on Wednesday was M Rougier who had a Voisin biplane. He made the first flight of the day, but his motor gave out, and he came to earth shortly after crossing the starting line After two unsuccessful attempts, M Latham flew once around the course at a great height with his "Antoinette XIII ' at the same time that M Paulhan was flying. He only succeeded in making one round, owing to motor troubles and the wind at a high elevation appeared to bother him as much as it did Paulhan, who was flying lower down M Henri Fournier, in a Voisin machine, was another novice to attempt a flight. After getting three-quarters around the course, he was dashed to the ground by the strong wind, and escaped with a broken nose although his machine was demolished M Latham also made a round at a great height with his No. 29 Antoinette monoplane. M Lefebvre was the only Wright pilot to attempt a flight. He soon came to earth, owing to the breaking of the gasoline feed pipe M Delagrange made a short flight on a small Bleriot monoplane, and M Bunau Varilla made a good flight on his Voisin biplane M Latham's best performance this day was three rounds of the course Between 6 30 and 7 P M eight or nine machines were quickly brought out and attempts were made to better the 10 kilometer speed record The Curtiss biplane was the last to start, which it did when no less than five aeroplanes were traveling around the course The aviator took the first turn rather wide He was obliged to fly above one machine, and he ran out of his course somewhat in order to avoid a collision with M Sommer on his Farman biplane He reduced his time to 8 minutes and 11 3/5 seconds in this flight. Short flights were made by M Legagneux on Capt. Forber's biplane, M Rougier and Bunau Varilla on their Voisin biplanes, M Sommer on a Farman biplane and M Delagrange on the Bleriot monoplane M Bunau-Varilla rose to a height of more than 300 feet

The record for speed and distance was made on August 26th by M Latham with his No 29 Antoinette monoplane The weather conditions were favorable at the start, but during the course of the flight M Latham encountered heavy wind and a rain storm He nevertheless kept the machine flying until the fuel gave out. He succeeded in making over fifteen rounds of the course in 2 hours 18 minutes and 9 3/5 seconds. The total distance covered was 154 375 kilometers (95 88 miles) The average speed was therefore 41 62 miles per hour The fastest round was made in 8 minutes and 20 3/5 seconds, at an average speed of 44 65 miles an hour This record surpassed that made the day before by M Paulhan, since the machine flew a considerably greater distance in less time, while it also demonstrated its stability in a wind of about 24 miles an hour and its capability of traveling through rain The flight was a complete vindication of the Antoinette motor which, it will be remembered failed Latham twice when he attempted to cross the English Channel This motor is of the V-type, having eight water-cooled cylinders It is one of the lightest motors ever constructed per horse-power Besides making this record flight in the P M Latham flew 70 kilometers (43 5 miles) in the A M with the "Antoinette XIII ' Count de Lambert flew 116 kilometers (72 miles) late in the P M also so that the long flights on Thursday totaled over 212 miles M Bleriot met with an accident on Thursday In order to avoid alighting upon some dragoons who were traveling across the field on horseback he steered his machine into a fence breaking the propeller and damaging the monoplane considerably He was making a flight with M Delagrange as passenger when the accident occurred M Rougier also alighted upon some spectators, but fortunately they were not seriously injured

Latham's distance record of Thursday was a record of only a day for on Friday, August 27th Henri Farman surpassed it decidedly with his modified Voisin type biplane now known as the Farman machine The sixth day of the meeting was the last one in which the Prix de la Champagne could be competed for, and everyone took it for granted that Latham's record of 95 miles in 2 18 would remain unbeaten About 4 30 P M Latham brought out the Antoinette XIII ' monoplane and started on another long flight Some ten minutes later MM Farman and Sommer started out quite unexpectedly upon Farman biplanes and a real race at once began. At the end of Latham's second round, he passed high above Sommer and Farman, who were flying close to the ground at about the same level and only 50 feet apart, Sommer leading The two biplanes made the last turn of the course only a second apart, and then Farman passed Sommer in front of the grand stand while the latter's machine dropped and touched the ground just as it crossed the line Sommer accordingly circled around the timer's box and crossed the line once more according to the rules, which maneuver placed him far in the rear Both biplanes flew at an average height of from 6 to 12 feet only while Latham maintained an elevation of from 250 to 300 feet His machine was considerably faster than the other two and he lapped both of them several times Latham covered 50 kilometers (31 05 miles) in 44 23 against Farman's 51 21 Eighty and 100 kilometers (49 71 and 62.14 miles) were covered by Latham in 1 11 20 1/5 and 1 29 20 2/5 respectively but finally after making 110 kilometers (68 35 miles) in 1 38 5 1/5, his fuel gave out and the monoplane glided to earth After Latham ceased flying Farman kept steadily on Sommer stopped after making three rounds because of motor trouble He afterward started again but too late to make a record before the closing of the lists at 7 30 Shortly before 5 P M M Tissandier started on his No 4 Wright machine and made 11 circuits in 1 46 52 2/5 At about the same time, Bunau Varilla made several circuits on his Voisin biplane, and Delagrange and Bleriot came out

(Concluded on page 171)

MEASURING A RIVER'S FLOW

BY A MAYO HALL

The increasing attention which is being given to the conservation of natural resources particularly to water power and the irrigation projects of the United States Reclamation Service renders timely some description of the manner in which the water supply is

Gaging the flow of a mountain stream with hand instrument

measured and recorded Through the kindness of Mr H C Rizer Chief Clerk of the United States Geological Survey at Washington the writer has been given facilities for a study of the system generally adopted which is as follows

The quantity of water flowing in a stream is expressed in various terms according as it represents the drainage from a watershed of given area the rate of continuous flow as for power purposes or simply volume and it may be as well to commence with a definition of these terms

Second foot an abbreviation for one cubic foot per second is the quantity of water flowing in a stream one foot wide one foot deep at a rate of one foot per second It is generally used as a fundamental unit from which others are computed

In connection with pumping and a city's water supply the water is generally measured in gallons per minute

The miner's inch is the quantity of water that passes through an orifice one inch square under a head which varies locally It has been commonly used by miners and irrigators throughout the West and is defined by statute in each State in which it is used

The average number of cubic feet of water flowing per second from each square mile of area drained on the assumption that the run-off is distributed uniformly both as regards time and area is given as second feet per square mile

Run off in inches is the depth to which the drainage area would be covered if all the water flowing from it in a given period were conserved and uniformly distributed on the surface It is used for comparing run off with rainfall which is usually expressed in depth in inches

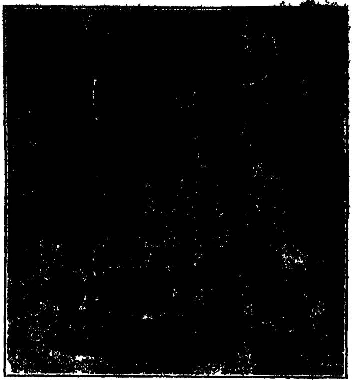
An acre foot is equivalent to 43 560 cubic feet and is the quantity required to cover an acre to the depth of one foot. It is commonly used in connection with storage for irrigation work There is a convenient relation between the second-foot and the acre-foot. One second foot flowing for twenty-four hours will deliver 86 400 cubic feet or approximately two acre-feet

Gaging stations are located upon streams as far as possible at points above and below which the channel is straight where there are no cross currents or backwaters and where the bed of the stream is smooth and its banks high Their equipment consists of fixed gages graduated to show the vertical fluctuations of the water surface and permanent bench marks indicating the points of measurement up and down stream when the channel conditions are satisfactory bridges are used as from them observations may more readily be made and the cost of equipment is small

Current velocity is measured sometimes by floats and sometimes by means of the meters illustrated herewith In measuring by floats of which there are several kinds the simplest being a corked bottle weighted at the bottom and carrying a flag at the top little affected by wind observation is made of the time taken by the float to pass over a selected run of the stream 50 to 200 feet long A number of velocity determinations are so made at different points across the stream and the mean velocity of the whole section estimated

The discharge is the product of that mean and the mean sectional area of the run which is determined by measurements and soundings of the two ends of the run and at intermediate points

When meters are used they are held stationary in the current at a number of points across the width of the stream and at different depths and the velocities recorded are averaged as before A typical meter much used in the government service is shown in the illustrations designed by Mr W G Price Its submerged portion consists of a small wheel carrying five conical buckets similar to that of the [illegible] meters; these are rotated by their [illegible] resistance to the current at their larger [illegible] small ends, the axis of the wheel carrying [illegible] tric by means of which electrical contacts [illegible] and broken in a suitably protected water-tight compartment. The number of revolutions made by the wheel are thus electrically recorded by the current of a battery operating the clockwork of the indicator dials Two of the small portable meters are also shown in one the revolutions are recorded by the striking of a small hammer [illegible] diaphragm, the sound being conveyed [illegible] tube to the ear of the observer who [illegible] the revolutions and in the other an [illegible] current from the small battery shown operates a buzzer when the contact is made and broken as has been described for the larger machine



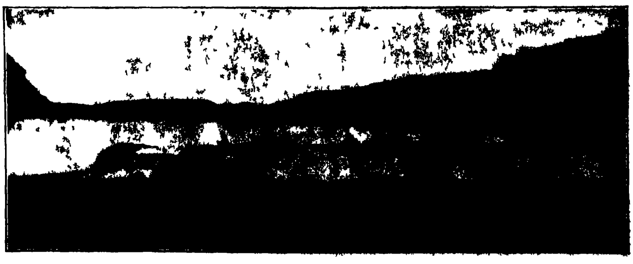
On the left a small Price electric meter, sounds received at the earpiece being transmitted by current from the small battery shown ; on the right a Price acoustic meter.

In each case the meter is supported above a pointed weight, provided with fins which keep it pointing straight upstream both in the vertical and horizontal plane

A meter calibrating station : the meters are drawn through still water at a known speed, and the revolutions they make recorded.

To insure the coincidence of readings by different meters each individual instrument has to be separately rated' to determine the exact number of revolutions it will make in a current of a certain speed This is done by drawing the meter through a measured space of still water at a number of different speeds and noting the number of revolutions made from which a rating table is prepared giving the velocity per second corresponding to any number of revolutions Current-meter measurements may be made by an observer on a bridge suspended from a cable in a boat or wading, and gaging stations are classified in accordance with the method used A wading station is shown in one of our illustrations.

The velocities indicated by the meters at different points in the stream are averaged by a variety of methods known as "multiple point," "vertical integration," etc. In the various multiple point methods the stream is divided theoretically into strips in the direction of its [illegible]



Great Falls of the Missouri River in Montana : A hitherto undeveloped water power

MEASURING A RIVER'S FLOW

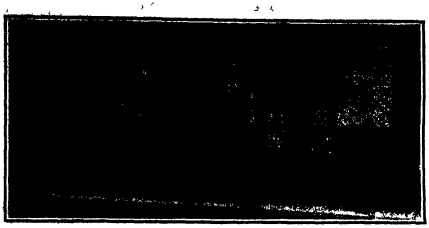
GERMAN MUSEUM OF MASTERPIECES OF SCIENCE AND INDUSTRY.

BY OUR BERLIN CORRESPONDENT.

Both England and France have long been in possession of a museum illustrating the evolution of science and industry and the mutual influences between engineering, scientific research work, and commerce and trade. The Conservatoire des Arts et Métiers of Paris (founded at the end of the eighteenth century), besides representing the significance of technical achievements in their relation to the factors above mentioned, is intended to propagate technical knowledge by the aid of popular lectures. The collections of the Kensington Museum (established toward the middle of the nineteenth century) on the other hand afford a comprehensive idea of the gigantic strides made by England in the field of mechanical engineering, without there being any more intimate connection between this part of the museum and its mathematical and scientific departments.

The German Museum of Masterpieces of Science and Industry, which was inaugurated a short time ago, is intended to become a national German institution of a similar kind, a special point, however, being made of the mutual influences of science and engineering. Apart from retrospective exhibits, the very latest achievements in the field of technical and scientific investigations were to be represented. Besides serving as a Pantheon to those men whose thought and work have been operative in fashioning modern civilization, this museum was thus to become a source of historical knowledge to the scientist, and a place to which both engineers and laymen could refer for fertile ideas and models.

As the Bavarian Academy of Sciences as far back as twenty years ago had made plans for extending its mathematical and physical collections on strictly historical lines, many useful instruments and apparatus of historical importance were already at the disposal of the founders of the new museum. The latter was inaugurated a few years ago (on June 28th, 1903) in provisional headquarters, the state having placed at its disposal the rooms of the old National Museum in Maximilianstrasse. As, however, these in the following years proved inadequate, an extension was granted by the Department of War, which at the beginning of 1906 authorized some collections of the museum to be installed in the [illegible] [illegible]. The foundation stone of the definite building was finally laid a few months ago by the German Emperor. The museum comprises



Apparatus used in Korn's picture telegraphy.

Successive stages in the evolution of the plow

Evolution of the automobile.

1. Collection of scientific instruments and apparatus as well as of remarkable technical products (both originals and models), which collections are well classified and provided with necessary information for the benefit of the visiting public

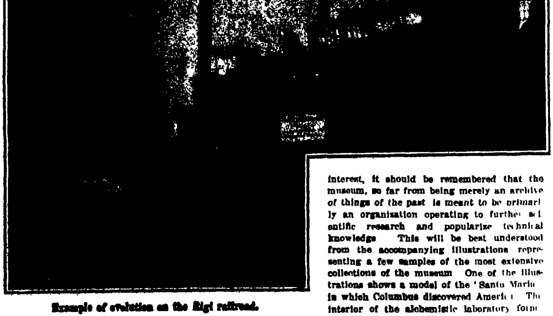
2 An archive containing important documents both scientific and technical.

3. A technical and scientific library containing manuscripts, diagrams, pamphlets and books

In order to preserve the memory of prominent workers in the field of engineering science portraits and biographies of those Germans whose labor has been especially noteworthy in furthering the evolution of industry will likewise be incorporated with the museum

In carrying out the task laid before the museum viz, to illustrate the evolution of any fundamental ideas and the influence of such ideas on the various economical factors, as well as to represent the ideal success of acquired knowledge and the importance of past experience the most varied methods and means had to be resorted to In fact, many fields which apparently are strictly separated from each other, had to be classified and combined together in order to afford an adequate picture of civilization as an offspring of science and engineering The historical aims of the museum are mainly realized by original machines and apparatus in addition to records of the very first experiments in a given direction, and the earliest sketches and designs These collections in order to illustrate the achievements of science and industry in a really comprehensive manner necessarily had to be international

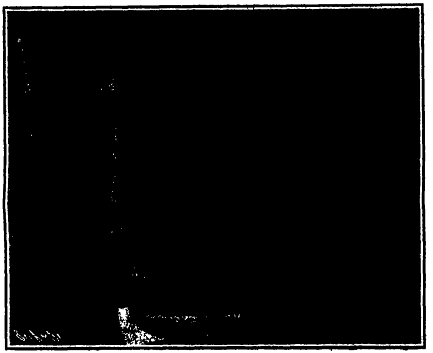
The central library above referred to and which is intended for serving the scientific purposes of the museum contains both ancient and modern works, pamphlets periodical publications, etc on subjects of engineering mathematics and science While furthering historical investigation this library is intended to make accessible to both specialists and lay people the very latest scientific and industrial achievements An archive of maps and diagrams of unsurpassed dimensions is connected with the library and will allow both the engineer and workman to obtain useful information on subjects otherwise inaccessible While the collection of documents and manuscripts is of mainly historical interest, it should be remembered that the museum, so far from being merely an archive *of things of the past is meant to be primarily* an organization operating to further scientific research and popularize technical knowledge This will be best understood from the accompanying illustrations representing a few samples of the most extensive collections of the museum One of the illustrations shows a model of the 'Santa Maria in which Columbus discovered America The interior of the alchemistic laboratory forms part of the exhibit and will be found espe



Example of evolution on the Rigi railroad.

GERMAN MUSEUM OF MASTERPIECES OF SCIENCE AND INDUSTRY cially instructive as compared with the examples of chemical laboratories in the eighteenth, nineteenth, and twentieth centuries While on one hand a most striking progress from the primitive apparatus of alchemists to the improved instruments of modern chemists will be noted it is interesting to observe that certain apparatus still retain their original traditional form in which they have been used by the predecessors of present-day chemists The evolution of plows is figured from the most primitive implement, viz., roughly shaped trees drawn first by men and afterward by oxen, to the present-day steam plows, passing through many stages which had to be traversed in various ages and centuries. Another feature in evolution pertains to the development of automobiles, from the first motor-car constructed by Daimler in 1885 to the most improved modern types In the same hall will be found a similar retrospective exhibition, relating to the various stages in the evolution of cycles. The strides made in a special branch of railway engineering viz., the construction of mountain railway locomotives are graphically rendered Side by side with the latest type of locomotive used on the Rigi railway is a model of the earliest type used on the same railway line the latter having been constructed in 1871

In the exhibit representing the achievements in the field of electricity is shown the outfit used in the Korn picture telegraphy, of which a description was given some time ago in the columns of this journal To the left in the illustration will be noted the sending apparatus with an electric lamp and the cylinder on which the photographic film is wound up, while the receiving apparatus is shown at the right Diagrammatic views and descriptions in addition to some samples of telephotographs further facilitate the understanding of this apparatus the importance of which will be fully gaged only after its introduction into general practice



The "Santa Maria," which carried Columbus to a new world

GERMAN MUSEUM OF MASTERPIECES OF SCIENCE AND INDUSTRY.

Black Diamonds.

BY GEORGE E. WALSH

The term black diamonds" is sometimes jokingly applied to ordinary coal which we burn in our furnaces, but the real black diamonds of commerce are among the most unique mineral products of the world and they serve a purpose in the industrial world that makes them of great value The black diamonds are pure carbon and yet in no outward appearance resemble the diamonds which we are accustomed to wear as ornaments. They are slightly harder than the crystal or gem diamonds, and in fact about the hardest substance known

Black diamonds or carbons are among the greatest curiosities of the mineral kingdom They are without crystalline form and are found in irregular pieces ranging in size from half a karat up to three four and five hundred karats They are dark gray black, or brownish in color and opaque The real diamond of the jewelry trade is also pure carbon but translucent and crystalline in form Two objects so alike in composition could not be found so opposite in appearance as these two forms of carbon

Another peculiar thing about the black diamonds is that they are found only in one locality in the world They come from a very small section in Brazil not more than 225 miles square in area Outside of this limited territory no pure black diamonds have ever been found In the Brazilian black diamond fields the natives dive in the river beds for them and recover them from the gravel and washings of the rivers.

What peculiar freak of nature caused the deposition of the black diamonds in this section of the world and nowhere else is one of the mysteries which science has failed to explain None of them has been found in the great Kimberly diamond regions, where the crystal form of diamonds have for so long been mined, and likewise no fine specimens of the gem diamond have been found in the Brazilian black-diamond fields.

The whole origin of the black diamonds is therefore a scientific enigma Naturally the question is raised "Of what use is a black diamond? No one would care to wear one of these diamonds which resembles a piece of coal more than a real diamond, and so far no one has popularized the black gems as the black pearl has been Nevertheless the black diamonds serve a most important and useful function in the industrial world

This pure black carbon is not only harder than the real diamond but tougher and not so brittle as the gem Consequently it is of great value for many mechanical purposes, and particularly for boring with diamond drills. In diamond drilling, the tips of the drills are studded with carbon or black diamonds, and when the bores are deep, the pressure is so great that the gem diamonds would be crushed in the process. But the carbon resists this continued pressure, and slowly eats down into the rocks

In diamond drill work, the carbon is set in circular pieces of soft steel or iron, called bits, and these bits are attached to tubing Armed with these black-diamond teeth, the drills push their way down under severe pressure to a depth of five and six thousand feet, cutting through the hardest kind of rock Some black diamonds are much harder than others, and there is no way to determine by the color the difference in the degree of toughness.

Black diamonds or pure carbon are not by any means cheap, and the owners of the mines in Brazil where they are gathered are making a good thing out of their monopoly In the last thirty years the prices of black diamonds have advanced from $5 to nearly $85 a karat, and the tendency is still upward. The arming of a drill with diamond points is thus a rather expensive matter Usually a set of eight stones are placed in the head of a single drill If each diamond weighs only three and a half karats, the total cost at $85 per karat would be about $2,380 for a single bit.

Great as this expense is, however, it pays, for the black diamonds are so tough that they last a long time, and they achieve results which could not be obtained in any other way There is no known substance that can take the place of carbon in drills in boring for gold, silver copper, and other mineral deposits. Before the black diamonds of Brazil were discovered, it was impossible to make deep borings.

When the carbon was first introduced in our industries it was used in diamond saws for cutting stones, marble and similar substances. Then the price advanced so that the carbon was found too costly for such use and bort was substituted for stone cutting Bort is really an imperfect crystal or gem diamond, but it is too brittle for use in drills. Consequently, bort has taken the place of black diamonds for stone cutting and the latter have been restricted almost entirely to diamond-drilling purposes.

The average size of black diamonds used in the drills ranges from two to five karats, but the larger specimens give much better results. They cost more, but they last longer Consequently, there is a greater demand for the larger pieces of pure carbon, and the price is sometimes run up to premium figures for unusual specimens.

The fear that the supply of black diamonds may some day give out and paralyze the diamond-drilling industry has stimulated prospectors to systematic search for new deposits, but so far they have not been successful On the other hand, scientists have been making a close study of the chemical conditions which have produced the black diamonds, but their manufacture is apparently about as difficult as the making of the gem diamonds. It is possible under certain conditions to make either but not in sizes sufficient to be of any commercial value. Nature in some peculiar way has made these rare products, and then thrown the secret of the process away If any man can ever unlock or find that secret, he may cause a panic in the diamond trade.

The Real Value of Steam Coal

In general, it may be said that a furnace [illegible] signed to burn almost any kind of coal with [illegible] ciency, and that the real value of a coal depends very largely upon the number of British thermal units which it contains. So states Mr. D. T. Randall, engineer in charge of fuel engineering department of the Arthur D. Little, Inc., laboratory of engineering chemistry, Boston, Mass., in a recent paper. He points out that tests which have been made at the government fuel-testing plant seem to indicate that the most important thing to be considered in a coal is its heating value. Following this, the size of the coal may be considered next in importance, and when the moisture, volatile matter and ash are widely different they must also be considered The results of more than 400 boiler tests at the government testing plant show that the average drop in efficiency for a range of coals between 14,000 B T U and 10,000 B. T U is only about [illegible] per cent. This difference is due to the combined influence of the size of the coal and the moisture, volatile matter, and ash in the coal. It will be seen from these figures that the probable influence of any of these constituents is not as great for hand fired furnaces as it is often thought to be. With certain boiler equipments in which a considerable overload is necessary at times, the effects of these constituents may be much more important, owing to the reduction in capacity which may be obtained, and it is for this reason that when coal is selected for a given plant it is important that the coal supplied should not vary greatly from time to time, otherwise, the fireman may have serious difficulty in maintaining the capacity required, and in burning coal with good efficiency

With a furnace which is well designed, there should be a close correspondence between the heating value of the coal and the water evaporated Small variations in moisture volatile matter, and ash should make little if any difference in the efficiencies obtained

The size of the coal may influence the results to a serious extent Small sizes of anthracite coal pack together closely and strong drafts are required to burn them This results in holes in the fire and a leakage of air in the boiler settings The loss is often estimated to be at least 10 per cent. This is also true of many of the bituminous coals. Other coals which coke readily forming a loose bed of fuel, do not show much loss, due to the presence of fine coal, except such as is so small as to be carried off from the grate by the draft. With any character of coal there may be a loss of fine coal, due to sifting through the grates. That this loss may be large is well known. The carbon in the ash is an important item in determining the losses in a boiler room. In many plants care on the part of the firemen has reduced this loss to the equivalent of 2 and 3 per cent of the fuel fired Occasionally, owners of power plants have purchased for testing purposes a coal of higher grade than they usually furnish for the boiler furnaces. The results obtained have often been disappointing, and without further investigation they have declared that the plan of purchasing coal on the basis of its heating value is at fault, and that corresponding results cannot be obtained from the higher grade coals. On the other hand, it has happened that others have tried coals of lower heating value than the coal regularly burned in their plants, and they often find a greater drop in the evaporation than they expected This has led many people to believe that there is a great difference in the value of coals for only slight variations in the composition.

Boiler tests are a rather crude method of comparing coals, especially if the fireman is not accustomed to burning the coal to be tested.

A chemical laboratory test is conducted under conditions which may readily be duplicated, and the results are therefore more reliable than boiler tests.

The averages of a number of boiler tests on each coal on which the combustion is fairly good in all cases should show results which agree quite closely with the chemical results on the coals, provided they are of the same general character If they vary in composition, a slight reduction in efficiency may be expected for the coals high in moisture, volatile matter, and ash.

The Mexican Central plant at Aguascalientes for preserving railroad sleepers with oil, which was started some years ago as an experimental plant to develop and perfect the Ebano oil process, is now treating about a carload, of 3,500 sleepers, daily Each sleeper takes up about three gallons of oil

Handy Man's Workshop

HOW TO MAKE CONCRETE POTTERY —VI.

BY RALPH C DAVISON

(Concluded from the issue of August 14th.)

In the previous articles nothing much has been said in detail in regard to the numerous and various materials which can be used in making concrete, such as the different kinds of stones, pebbles, etc Nor has anything been said about the quantity of each ingredient necessary to make a fixed amount of finished material.

Concrete is made by mixing together with water various proportions of Portland cement, sand and stone. The sand and stone which go to make part of the mixture are commonly known as aggregates. It is by the careful selection of these aggregates that we are able to produce numerous pleasing and artistic results.

In many cases, if the proper aggregates are used in the right proportion, natural stones such as limestone, granite of all colors, brownstone, and French Caen stone, etc., can be so closely simulated that it takes an expert to tell it from the real material

The ordinary concrete or cement surface as usually seen is most uninteresting in appearance As a general thing, it is smooth and lifeless and of a dull gray color The same general appearance as just described for ordinary concrete will prevail in almost any concrete surface, no matter what the aggregate used unless the surface is treated so as to expose or bring out the aggregates used If, however the surfaces of the concrete in which selected aggregates have been used are property treated, a marked difference between these surfaces and those obtained with ordinary mixtures will be noted By varying the kind size, and proportions of the aggregate used surface finishes of practically any desired color and texture can be obtained, the possibilities being limited only by the number of different kinds of aggregates available and the combinations of the same

In small work, that is, where the thickness of the finished product is to be ½ inch or less never use any aggregate exceeding ⅛ inch in size especially so if the mixture is to be made thin enough to pour In larger work having a thickness of 1 inch or more, aggregates up to ¼ of an inch can be used with good results

Some interesting textures for pottery work can be obtained from the following mixtures

A mixture composed of 1 part white marble chips not exceeding ¼ inch in size, and 1 part of trap rock or other dark stone of the same size mixed with 1 part of Portland cement and 1 part of marble dust will produce a surface similar in appearance to a light granite This mixture should be allowed to set for twelve hours after pouring, then the molds should be carefully removed, as the concrete is still green, and the surface of the concrete should be lightly brushed with a stiff brush

As the concrete is not thoroughly set or hardened yet, this operation will remove the surface cement and thus expose the aggregates of marble and trap rock After having performed the above operation allow the piece to harden a few days, and then treat the surface with a solution composed of 1 part of commercial muriatic or hydrochloric acid to 3 parts of water Dash this solution onto the face of the concrete surface with a brush, and allow it to remain for at least fifteen minutes. Then thoroughly scrub it off with a good stiff brush and plenty of clean water This operation will remove all of the surplus cement. and will leave a good clean surface full of life and sparkle. Instead of using white marble chips and granite, as above, one can vary the results by using white marble chips and crushed-up red brick, or various colored marbles crushed to the proper size can be used, and than by treating the surfaces as explained the colors in the various aggregates will be exposed. thus producing some very interesting surfaces

A good light-colored surface somewhat simulating limestone can be procured by using 1 part Portland cement to 2 or 3 parts of white marble dust. After this has become thoroughly hard, treat it with acid as described above. The acid will eat off any surface cement, and thus the marble dust will be exposed, producing a pleasing sparkle throughout the entire surface. To simulate white marble, use 1 part white Portland cement to 2 parts of marble dust, and treat surface with acid as described.

By incorporating in the above mixture a small amount of yellow ocher a pleasing buff tint will be given to the mass, which will then very closely resemble French Caen stone To simulate red granite, use red granite chips or screenings. These can be procured at almost any stone yard where they cut granite. The pieces to use should range in size from ¼ inch down to dust. If the pieces available are too large, they can be crushed up with a hammer The proportions of the mixture should be 1 part of Portland cement to 2 parts of the granite After having set for twelve hours, brush the surface out and treat it with acid as already explained and the surface thus obtained will very closely resemble the real red granite. From the above details the reader will have grasped the possibilities to be obtained by the selection of aggregates, and now by using a little ingenuity can without further instruction experiment along original lines, which will be found most fascinating work.

In regard to the amount of the various ingredients to use for a fixed amount of finished material the uninitiated often think, and naturally so, that if an amount of finished material equal in bulk to three glassfuls is required, all that is necessary to do if it be a 1 to 2 mixture, is to take one glassful of cement and two glassfuls of sand, and then by mixing these together they will still have an amount of material that will fill three glasses. This is not so The particles of cement are ground so fine that the cement is practically one dense mass, but the particles of sand are coarser, and between each of the particles appears a space or cavity These cavities are called voids, and it is in these voids that the larger portion of the cement finds its place when the mass is mixed The majority of sands used in concrete work contain from 25 per cent to 40 per cent of voids. If we take the larger figure for an example, then in two glassfuls of sand we will have 80 per cent of one glassful of voids. As we only have one glassful of cement to add to the two glassfuls of sand, and as the cement fills the 80 per cent of voids in the sand it is plain that we have but 20 per cent left upon which we can figure for bulk Therefore, instead of having three glassfuls of material, as one might naturally think we will only have two glassfuls and 20 per cent of one glassful over, or two and one fifth glassfuls of finished material The percentage of voids varies largely in different grades of sands. The finer the particles of which the sand is made up, the smaller the percentage of voids It is always best to use sand in which the particles are not uniform in size, or in other words, use what is commonly termed a well-graded sand By this is meant a sand in which the particles vary in size say from 1/32 inch or less up to 1/16 inch or a trifle more The heavier the work, the coarser the sand that can be used. Be sure that the sand used is clean By clean sand is meant sand that is free from loam or clay One can readily detect dirty sand by placing same in the palm of the hand and slightly wetting it Then if by rubbing it around the hand becomes discolored, there is more or less dirt in the sand A little dirt will not do much harm, but it is always well to have it perfectly clean It is often found necessary to wash the dirt out of sand by means of water This can be done by placing the sand in a pail of water and agitating it, thus making the dirt rise to the top To thoroughly wash the sand keep running the water into the pail and agitating the sand until the water discharged is practically clear

When using a stone aggregate in the mixture the spaces or voids between the particles of stone are filled by the cement and sand in the mixture, as were the voids in the sand filled by the cement. As in sand the larger the particles of stone used the greater the percentage of voids in it will be Therefore a greater amount of sand and cement will be required to fill them.

By a little experimenting along these lines, one will become experienced enough to judge fairly closely the amount of each ingredient to use in mixing up any amount of finished material needed It is always well to mix a trifle more material than is needed rather than not enough For when one once starts pouring a cast, he should continue to pour until the mold is full If not, a mark is very apt to show in the finished cast where pouring was left off and started again Never try to use any material that has been mixed and let stand for more than half an hour For in this time the concrete will have commenced to get what is called its initial set. If the mass is now disturbed and worked up again the product produced will never have the same strength as one made with freshly-mixed material In mixing always mix the cement and sand together thoroughly before adding the water One can judge by the color of the mass fairly well as to whether the mixing is complete If the color is uniform throughout it is a pretty good sign that the aggregates are well distributed through the mass. When making a mixture containing cement, sand and stone always mix the cement and sand dry first and then add the stone which has previously been well soaked in water In this way one is assured of having each stone coated with the cement and sand for as soon as the damp stone comes in contact with the dry cement and sand they adhere to it and cover the stone completely thus a compact matrix of cement and sand is formed between each and every particle of stone which binds them securely together into a dense and compact mass.

HOME-MADE CHEMICAL PERFUME

BY GUSTAVE MICHAUD COSTA RICA STATE COLLEGE

Early in the nineteenth century chemists generally thought it impossible to make organic compounds out of the elements found in them Synthesis they believed to be practicable only in the case of minerals. Woehler with his remarkable synthesis of urea shook that belief at least as much as the Curies recently shook the common belief of chemists in the integrity of the atom Other organic syntheses followed that of urea, and some of them as that of the alizarin dye, were made in conditions so favorable that it became unprofitable to grow the plants from which the chemical had hitherto been extracted Thousands of acres have thus been so far given back to the cultivation of food stuffs and one may confidently expect a time in which most if not all of our drugs dyes and even food will be made through synthesis Agriculture then will be a thing of the past Factories will make for us sugar starch fats, proteids that is to say bread eggs milk fruits besides some new foods which may prove as superior to the old ones as antipyrin and pyramidon have proved superior to the natural alkaloids formerly used in similar circumstances

The most recent and greatest advance in the organic synthesis of industrial products can be observed to-day probably in the perfume industry The fragrance of heliotrope hyacinth, pink rose violet hawthorn lilac, musk wintergreen vanilla cinnamon bitter almonds, and that of many fruits are now produced with chemicals which frequently have but a repugnant smell or no smell at all Most of these syntheses require complicated apparatus as well as considerable chemical skill but in one case at least that of terpinol, an essence now sold sometimes under the name of lilac sometimes under that of lily of the valley the operations are simple enough and the synthesis is but an enjoyable experiment easily performed at home or in the class room

APPARATUS FOR MAKING ARTIFICIAL LILAC PERFUME.

Besides the vessels found in every kitchen the only needed apparatus are a round bottom flask (capacity about one pint) a rubber stopper with one hole and two glass tubes united with a piece of rubber tubing The preparation may be divided into two operations, i e the transformation of common oil of turpentine into terpin and the transformation of terpin into terpinol The first operation requires much time and no care whatever The second operation is made in less than a quarter of an hour

One-half of a quart bottle is filled with oil of turpentine Three-fourths of a pint of alcohol at about 80 per cent is mixed with it and one-fourth of a pint of nitric acid is added to the mixture, which is left to itself for several days until crystals are formed These are collected and dried with some blotting paper They are pure terpin To get the full amount formed in such circumstances one should wait over three months but for experimental purposes such a delay is of course unnecessary Moreover should the experimenter wish to prepare the perfume at once he may get the ready made terpin at the drug store as it is prescribed by physicians for a kind of lung trouble

To transform odorless terpin into fragrant terpinol terpin must be heated with water containing a small amount of sulphuric acid The round bottom flask is half filled with water Two or three large spoonfuls of terpin are thrown into it and about as much sulphuric acid is slowly poured into the flask There is no danger in pouring sulphuric acid into water but water should never be poured into sulphuric acid, as the heat thus suddenly generated may cause some of the caustic liquid to be thrown out of the bottle

An alcohol lamp is now lighted directly under the flask If a gas stove be used a piece of wire gauze should be interposed between flame and flask As soon as the liquid in the flask begins to boil the glass tube is plunged into the water in a tumbler There the steam and the terpinol carried along with it noisily condense A delightful scent fills the room To keep the tumbler cool place it in a bowl of water The operation is over when the liquid in the tumbler has become nearly hot in spite of the water in which the glass is immersed A layer of liquid terpinol will then be found to float over the water The fragrance which is extremely strong while the essence is warm becomes much more agreeable after it has cooled Some odoriferous plants such as marjoram contain terpinol in their leaves but the extraction of the essence from such sources is always much more expensive than its synthesis with oil of turpentine

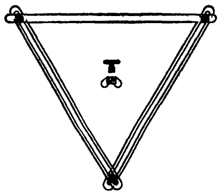
◆

PAPER HANGER'S ADJUSTABLE TEMPLET

BY I G BAYLEY

This handy tool will be found useful and will save considerable time in cutting wall paper up the rake of a stairway or where any roof slants allowing the paper hanger to cut a number of lengths of paper on the paste board at once where at present it is only customary to cut one at a time

The tool can be made of wood and satisfaction obtained although a better tool can be made from saw steel Each blade is about three feet in length two of them being furnished with slots running almost the full length Three thumbscrews detailed on a larger scale will be necessary to hold the frame together after the proper adjustment is obtained The paper should be hung in position on the wall and one side of the tool held along the perpendicular edge of the paper while one of the other sides of the tool is adjusted to suit the angle of the stairway or slanting roof when the screws are tightened up and the frame permanently set



PAPER HANGER'S ADJUSTABLE TEMPLET

◆

HOW TO MAKE A SIMPLE DRY BATTERY

BY E BON F WORTS

Often the experimenter is in need of a good dry battery of a certain size or shape for some particular work where the ordinary standard sized cell is either too large or not of the right shape for the same work An inexpensive dry cell that will produce results and can be made by anybody capable of handling a soldering iron has long been the desire of every experimenter The cell as described herein has been used for many purposes and with marvelous results by the writer and has been used in other shapes where economy in space was desired such for instance as in wireless telegraphy

To make a cell of the standard size a strip of zinc of medium thickness 8¼ inches long and 6 inches wide is necessary The zinc is rolled into a cylinder 6 inches long and 8 inches in circumference thus leaving a quarter of an inch which is to be tightly soldered A zinc cap is next soldered on one end of the cylinder Any solder showing on the inside is to be well shellaced Do not shellac any zinc surface as that will interfere with the action of the battery Line the inside of the cylinder with a thin layer of blotting paper For the positive pole of the battery the carbon from a wornout cell is the best if procurable but if not a bundle of arc light carbons with the copper surface well filed off is the next best The chemicals for producing the action that generates the electricity are ¼ pound of sal ammoniac ¼ pound of chloride of zinc (paste form) ¼ pound oxide of zinc and ¼ pound plaster of Paris These salts should be thoroughly mixed with a mortar and packed tightly in the cylinder about the carbon, which is a half inch from the bottom of the cell. This paste will fill the cylinder to within half an inch of the top, the rest being filled with paraffine A copper terminal soldered to the zinc and a heavy copper wire scraped clean and bound about the protruding end of the carbon form the negative and positive connections for the cell

This cell can be easily formed in various other shapes to suit the experimenter's fancy The cell herein described if constructed according to specifications will produce very satisfactory results especially in ignition work or for wireless It will register about 1 2/5 volts and between 10 and 15 amperes

HOME-GROWN CALABASH GOURDS

BY CHARLES A MIDNAN

The Department of Agriculture through its office of foreign plant introduction has brought to the notice of the smokers of the country one of the most useful articles of their trade This is the curious calabash gourd a plant indigenous to South Africa, and from which the highest quality of pipe bowls can be made

PIPES MADE FROM CALABASH GOURDS

The plant is now being introduced into the United States for the purpose of pipe making and it has been found by experiments to thrive perfectly in our climate The perfect success with which the gourd can be grown in almost any part of the country warrants the belief that it will prove a good investment to import a large amount of seed from South Africa

A curious feature of the calabash gourd pipe is its great resemblance to a certain capacious bowled meerschaum popular in Germany It is said that a Boer farmer first utilized the gourd as a pipe and that the English shortly afterward recognized its merits and the use to which the plant could be adapted

From the educated smoker's point of view the calabash pipe not only yields a very sweet and cool smoke but it colors beautifully far surpassing in this respect the finest meerschaum Besides taking on a high polish its life is about as long as that of a French brierwood pipe The usual lining is of plaster of Paris usually known by the trade as pipe meerschaum

The present market price of these calabash pipes is rather high owing to the fact that there are but few grown in this country and also to the fact that these gourds are never of the same shape and size necessitating the making of the mountings by hand

The writer was given a few seeds for testing and his success was all that could be desired The plant was of very hardy growth and the fruit set very easily As there was only one plant each flower had to be pollenized The plant was grown on a trellis about five feet high but as the fruit began to get very heavy it had to be tied to the wire In growing the plant for pipes it seems to demand a very hot and dry soil with rain at the right season to bring the gourds to perfection The curved stem end of the calabash forms a light and appropriate shape for the pipe The majority of the gourds take their own shape but for special shapes they must be tied.

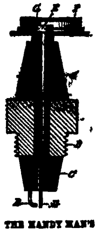
THE GOURDS ARE TIED TO THE TRELLIS TO GIVE THEM THE PROPER SHAPE

Any man who has a small space in his yard can grow enough pipe gourds in a season to last him for several years.

THE HANDY MAN'S SPARK PLUG

BY S W [illegible]

The spark plug shown here is equally well adapted for high or low tension ignition It may be made by a handy workman out of an old mica plug by taking out the steel wire down the center and putting in its place a piece of brass tubing, 3/16 of an inch outside diameter and ⅛ of an inch inside diameter A and B are the terminals forming the spark gap C is the mica, and D the threaded body of the plug The upper end of the terminal A is riveted to a small valve which is pressed down by a weak spring and thereby closes the upper end of the tube as shown in the sketch A valve chamber is screwed on the upper end of the tube, thus holding the mica together The valve operates in the chamber being fastened thereon by the screw F The valve and its seat should be ground flat and then the terminal A should be riveted to it There is a small hole E in the cover of the air chamber The cover should be fastened to the chamber with a screw or other simple means so that it may easily be detached for the purpose of cleaning the valve In use the terminal A vibrates with a noise like the trembler of a coil and in this way strikes the terminal B During the compression stroke the compressed gases travel up the central tube lift the small valves and instantly fill the valve chamber to the same pressure as the cylinder With the same pressure on both sides of the valve it will be forced down by its spring But as the gases in the chamber C escape through the hole G the pressures will be thrown out of balance and the valve will again be raised by the pressure in the cylinder This action will continue during the entire compression stroke The hole G should be extremely small and the amount of gas that will escape during compression will not perceptibly lessen the power of the engine It will be clear that as the valve is raised A approaches B and also that A moves away when the valve is closed because the fulcrum is virtually at the screw F



THE HANDY MAN'S SPARK PLUG

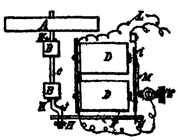
As A keeps striking B while it vibrates the low tension contact or touch spark may be used with this plug This plug gives many contacts and therefore many sparks instead of the single contact given by the usual hammer and anvil This plug is far simpler than the hammer and anvil system and besides it does not leak and lose compression like the latter does when worn It will work with high tension ignition with a trembler coil As the terminal vibrates it keeps itself clean and an excess of oil or soot will not affect it like an ordinary plug If used for high tension ignition the period of vibration should not be the same as that of the coil trembler or an odd spark will be missed owing to A being sometimes in contact with B when the high tension current is in the act of flowing The terminal A may be made to vibrate as rapidly or slowly as desired by strengthening or weakening the valve spring

◆

HOW TO MAKE A SIMPLE ELECTRIC ENGINE

BY ROBERT N BROLEMAN

A simple electric engine may be made as follows Take an ordinary electric bell and remove the gong The striker arm should be cut off about ¾ inch from the armature leaving the butt G A strip of brass 1/16 inch thick and ¼ inch wide of suitable length is bored at both ends one end to fit the butt G and the other end to fit the crank J of the shaft C The shaft is made of ¼ inch diameter brass or steel Care should be taken to make the stroke of the crank J the same as that of the armature



A SIMPLE ELECTRIC ENGINE

The balance wheel A is fastened to the shaft C Any wheel of suitable size and weight can be used In the model made by the writer a valve wheel 2 inches in diameter was used

The bearings B can be made of strip brass—in the model screw eyes were used K K are wire rings soldered to the shaft C to keep it in place H is a wire ring soldered to the crank to keep the strip F in place

When the screw E is properly adjusted and the terminals L are connected to a battery the engine will run at a high rate of speed.

RECENTLY PATENTED INVENTIONS.

Pertaining to Apparel.

MILLINERY DEVICE.—J Porges, New York, N. Y. This invention relates to a device by which one may determine the effect of any particular style of hat without having the actual hat at hand. A relatively large card or screen is provided having a display opening for the head, and a pictorial representation of a hat about the opening, a portion of which is adjustable to and from the screen in order that the effect of the hat may be obtained.

SKIRT-LIFTING DEVICE. — M Bechem, Wilmington, Del. The object here is to provide a device arranged for attachment to the waist of a woman, to allow her to raise the skirt evenly all around and to support it in this position without requiring the use of the hand, and with a view to prevent the skirt from being soiled when walking in rainy weather, and to allow her to use both hands freely for carrying an umbrella, or when entering or leaving cars and vehicles.

BOOT AND SHOE HANGER.—C B Robuck, San Bernardino, Cal. This device is adapted for use in suspending or supporting boots, shoes, and other foot wear having a sole or heel crease, the same being in the nature of a spring clamp adapted to embrace the heel portion of the article and thus hold it by friction in any position in such manner as not to obstruct the view of the same appreciably

Electrical Devices.

MACHINE TELEGRAPH — G C. Read, Davenport Station Toronto, Canada Mr Read's invention refers to machine telegraphs, his more particular object being to provide a receiver system including mechanism whereby currents sent over an electric line and made up of dots and dashes, are caused to operate the keys and analogous parts of a typewriter, so as to print the letters corresponding to the telegraphic characters.

ELECTRIC GENERATOR.—E. F White, Spokane Wash This invention refers to electric generators of the portable manually-operated type, the more particular purpose being to provide an improved form of such generator especially suitable for blasting and having a high degree of efficiency with great mechanical strength.

ELECTROTYPE.—A Van Winkle, Newark, N J The electrotype is for use in galvanizing iron or steel in such a manner that a very heavy and smooth deposit is obtained. For this purpose use is made of a solution containing fluosilicate of zinc in combination with certain salts, and a small quantity of gelatin or other organic substance that improves the deposit.

Of Interest to Farmers.

CULTIVATOR.—D J Ellis, Parlier Cal The invention relates to cultivators, and has for its object to provide a cultivator with teeth which may be adjusted as to depth and which may also be rotated in the teeth bar so that the cutting edge may be turned to any desired angle relatively to the said bar

PLANTER.—J H McCoy Aberdeen S, D The aim in this improvement is to provide economic check row devices of novel construction and accurate in operation and that will avoid the use of ropes, wires, or equivalent guides, and wherein the working mechanism includes means for effectually laying off or marking the rows to be planted

PIG-FORCEPS. -W Robertson Vail Iowa This invention is an improvement in pig forceps. In operation it will be found that the forceps may be easily inserted and engaged with the presenting portion of the pig, and when once engaged will retain a firm grasp thereon. The different sized pairs of blades also provide for the use of the same instrument on large and small animals.

EGG-CARTON—R. M Odell, Hoisington Kan. One object of the inventor is to provide a device by which eggs may be shipped without danger of breakage, in separate cells which are so joined together as to form a single package designed to be placed in a case, and when so placed to form a rectilinear body which will act as a brace for the case itself

POTATO-PLANTER.—G W Nation Alliance, Neb. This potato planter attachment is for use in connection with the agricultural implement shown and described in a co-pending application filed by Mr. Nation In operation a roller engages an arm thus swinging the latter out of a chute and dropping a potato cut into the furrow As soon as the roller passes the end of the arm a spring immediately returns it into a pocket to engage another cut. The disks are provided with arms, which loosen the ground and cover the potato cuts deposited in the furrow.

STRAW-RACK FOR GRAIN SEPARATORS.—J. P Hirsch, Lake Mills, Iowa. The purpose in this case is to provide details of construction for racks, which are adjuncts of a grain separator, whereby positively continuous and regular speed and reciprocating motion of the racks is assured, and a reliable separation of the grain from the straw is produced while the threshing is being conducted.

PLOW-BLADE.—O. S. Jewett, Lordsburg, Cal. The object here is to provide a blade, which in suitable number are radially arranged and secured in lapped engagement with each other and with clamping disks, whereby a spading wheel is produced that in series is secured on an axle at suitable intervals, said axle being journaled on a frame that is adapted for progressive movement

CULTIVATOR.—A. Brindon Albertville, Ala The object of the invention is to produce a cultivator of simple construction the teeth of which may be adjusted so as to change their distance apart as may be desired and further to provide a construction which will enable the teeth to be adjusted as to their elevation to adapt the implement for use on a hillside or ridge

PLANTER. — A Brinkoetter, Floresville, Texas. This planter is without springs inside of the seed box which are apt to be choked or gummed by the seed or dust. The invention provides bottom plates and feed plates of different sizes, which may be used with seeds of different sizes, and also for seed which are to be planted a greater or shorter distance apart

AGRICULTURAL IMPLEMENT.—A C Nelson, Nelson Township N D This invention relates more particularly to such implements as are known as potato forks, and each of which in general consists of a head having a fork integral therewith the latter being provided with a plurality of tines, a shaft having a handle at its upper end pivotally secured to the head, and means for locking the shaft in a plurality of positions on the head.

Of General Interest.

CURRENT MOTOR.—C A Neyland, Spokane Wash. This invention relates to wave or current motors of a class that utilize the force of a moving body of water such as a flowing stream or tidal action for useful effect The purpose of the invention is to provide novel features more particularly for the current motor formerly patented by Mr Neyland

RELEASING DEVICE.—C Hunt, New York N Y The intention here is to provide a device arranged to permit instant releasing of the boat lowering means from the boat as soon as the latter reaches the water, thus allowing the crew to quickly pull away from the vessel and thus prevent the boat from injury by bumping against the side of the vessel especially if a heavy sea should prevail at the time

APPARATUS FOR CONSTRUCTING CONCRETE PIPES.—F Teichman, San Francisco Cal In this patent the invention relates to concrete pipe constructions, the more particular object being to provide certain general improvements in the molds for cheapening the building of concrete pipes An advantage lies in the arranging of the plates of the inner mold into a general spiral form to facilitate the removal and replacement of the plates as the work proceeds.

FENCE-CLAMP.—P Garen Wytheville Va This invention is an improvement in fence clamps and relates particularly to the means whereby the lines of the wire of wire fences may be held for connection with the stretching device The construction is simple and by forming the opposing surfaces curved the wire will be tightly and firmly held and as the curve prevents slipping the clamp may be operated efficiently with fewer bolts than in ordinary constructions.

FASTENING.—I Coleman New York, N Y The invention refers to eye glasses and spectacles and the object is to provide a device for securely fastening the frame and lenses together without use of screws, and use is made of a stud held in a post lug and extending through an aperture in the lens, the free end of the stud being engaged by a locking device having connection with the post

PROCESS OF MANUFACTURING SOLUBLE COMPOUNDS OF MERCURIC SALTS WITH HEXAMETHYLENE-TETRAMIN.—A. Busch Brunswick, Germany The invention consists in the application of the discovery of a process in which, for instance, dry hexamethylene-tetramin mercuric chlorid is mixed with an equal weight of an albuminoid, soluble in water, such as albumose peptone, alkali-albuminate, casein alkali or the like, and the mixture is dissolved in a soap solution, the mercury of the solution is in an organic form and no longer to be precipitated by the usual reagents for precipitation of mercury

CONCENTRATING-TABLE.—J W Meyers and D F Paine, Ely, Nev The table is such as used in concentrating the crushed ores of precious metals. Simple means are provided for maintaining a cover such as linoleum, in a taut condition the general object being to prevent buckling or formation of ridges or unevennesses in the cover, which usually necessitates the removal or replacing of the cover

Hardware.

ANTISAGGING DEVICE FOR DOORS.—C Lehman, Elgin, Iowa The purpose in this case is to provide a device which may be manufactured at little expense, and which is adapted to lift the door to a normal position after the wearing of the hinges causes it to drop out of normal position, the support being so constructed that it is certain of operation although the pintles of the hinges are out of alinement.

LOCK. — H. C. Waldecker, Austin, Minn. This invention pertains to locks such as used on doors. It concerns itself especially with locks which employ a latch bolt for latching the door and a bolt for locking the door The latch bolt is withdrawn by turning the knob, while the locking bolt is operated by a key.

SAW-HANDLE.—R. D. Bowen, Oakville, Wash. The invention relates to fastening means employed for securing saw handles to cross-cut saws, and the special object is to so construct the fastening means that the parts cannot become accidentally loosened, which presents no obstructions or sharp points which might injure the hand of the workman and which can be readily dissembled to permit removal of the handle.

BRUSH.—S. A. Van Bryck, Belleville N J The purpose here is to provide a paint-brush or the like, in which the bristles are securely attached to the head of the brush in which the ferrule holding the bristles in position is compressed and partly imbedded in the head to hold it in place in which a comparatively small head can be employed for holding a large quantity of bristles, and in which the necessity of extensively nailing or otherwise securing the ferrule to the head is obviated.

PROTECTION NOZZLE FOR FIRE HOSE.—M J Marum New York, N Y The production is of a nozzle having a construction which will enable a protecting sheet of water to be thrown out from the nozzle and between the firemen and the fire so that the firemen will be protected from the smoke and gases of combustion and to arrange the nozzle in a way that the sheet will not have the effect of producing a draft toward the fire

KEY RING TAG.—H E Milleson Shelbyville, Ind Mr Milleson's invention consists in the forming of the tag of two separate plates, one constituting an identification plate and the other a stamp-bearing plate the two plates being so connected together that the stamp is normally protected yet may be readily exposed to view

BELT LACING TOOL.—J W Kane and W R Christie New York N Y This tool is adapted to be used in lacing the ends of belts together The invention consists in a gouge adapted to cut openings in the belt of any size desired and a slicing knife which is adapted to cut lacings for the belt of a size such that they will fill the openings cut by the gage.

LUBRICATOR FOR SAW BLADES.—G E. Hanzinger and S. J Rowan Greenville Miss The aim in this instance is to provide a lubricating attachment which may be easily operated when required whereby lubricant may be discharged at will upon the saw blade so that it is enabled to make a narrower and smoother kerf with less friction Thus lubricated a blade requires less set or spread of teeth and will do closer smoother work with less force

SICKLE SHARPENER. -- O A Haugen Arkansas Little Rock, Ark The sharpener is for use in connection with a grind stone and to provide means for clamping a sickle bar on a support mounted on the frame of the stone A universal joint permits movement of the sickle to give it the proper angle to the stone and a counter balanced sickle carrier is arranged to be raised or lowered and to be moved lengthwise along the stone so that the sharpening can be performed with quickness and convenience

STIRRUP.—G W Hooks, Sourlake Texas The stirrups are made rights and lefts, the right being the exact opposite of the left and they will always hang in proper position for the insertion of the foot without twisting the stirrup leather The inner side will not chafe the body of the horse It may be made of any suitable material and form of body or foot plate to accord with the saddle

NUT LOCK.—W R Garner, Palestine, Texas This improvement in nut locks is especially in that class of nut locks and plates designed for use on railroad joints frogs, cars bridges and the like as well as on engines iron fencing buggies, wagons, and otherwise where similar locks can be employed

Heating and Lighting.

PETROLEUM BURNER FOR INCANDESCENT LIGHTS.—F Holy Berlin Germany This invention relates to burners which have a horizontal flange around the top of the outer wick. This flange is usually permanently connected with the outer wick tube but according to the present invention it is made independently thereof and is supported by the burner gallery, for instance, by means of arms or feet which are mounted on a ring fastened to the gallery

VACUUM VALVE FOR HEATING SYSTEMS.—F Shurtleff Moline Ill. In this patent the invention is an improved valve or combination of valves for maintaining a partial vacuum in a heating system. It is capable of use with any vacuum heating system or other apparatus where it is desired to prevent the return of air after it has been expelled

Household Utilities.

MATTRESS.—P Klimowicz and J S Worzalla Stevens Point, Wis. This mattress is intended to provide a comfortable and healthful position to the person and to this end is constructed with an approximately transverse groove or depression in which the shoulder is adapted to sink, and a number of substantially longitudinal grooves intersecting the transverse depression to receive the forearm and a loose covering over the depressions.

COFFEE-POT.—T J Clement Atlantic City, N J This pot has a percolator which can be readily introduced and removed The construction of the percolator is such that it holds itself fixed within the coffee pot the member which operates to hold the percolator within the pot operating also to hold the cover of the percolator in position.

SERVING-CUP FOR BEVERAGES.—T J Clement Atlantic City, N J. The cup in this instance is for use in serving beverages, and it has improved means for refrigerating the glass containing the beverage to the end that a beverage can be kept cold even if allowed to stand a considerable time after having been served.

DIPPING DEVICE FOR BOTTLES OR JARS.—R. W McGinnis Wichita, Kan The device is for use in holding bottles or milk jars when they are being dipped to sterilize or scald them It can be operated in a simple manner to hold a number of bottles in a convenient manner to enable them to be dipped in a vessel having a scalding or sterilizing bath.

DINNER PAIL.—A M Hunt Hampden Maine. The invention refers more particularly to devices for carrying food and the like which includes a number of traps for liquid and solid contents and which have means for holding heat-supplying substances such as burning coke or charcoal for maintaining the contents of the receptacle in a heated condition

BED.—W H Long Charleston S C This invention shows a form of invalid bed in which the mattress frame can be raised at the head and lowered at the foot to suit the necessities or convenience of the occupant Efficient means are provided for actuating the parts and for maintaining the intermediate portions of the mattress and the head portions of the mattress under the desired tension regardless of the adjustment of the bed

COVER FOR TEAPOTS.—T J Clement Atlantic City N J This invention is a division of the invention described in a patent the application of which was formerly filed by Mr Clement The improvement is useful in connection with any pot on which a beverage may be brewed from leaves or grindings, or indeed it may be used in any connection where the contents of a serving vessel should be strained before serving

ADJUSTABLE SHADE SUPPORT.—C P Westhauser New York, N Y In this patent the invention is an improvement in shade and such like supports the present embodiment of which belongs to that class of such devices in which the shade-supporting arms are adjustable to and from each other to accommodate shades of different length

Machines and Mechanical Devices.

STARTING DEVICE FOR THE COMPRESSED AIR MOTORS OF SELF-PROPELLED TORPEDOES.—A E. Jones Fiume Austria Hungary This invention consists in particularly connecting the delay action flap of ordinary construction with the reducing valve of the pressure reducer arranged between the compressed air reservoir and the motor for dispensing with the moderating part of the air admission valve ordinarily arranged between the reducer and reservoir and the auxiliary air supply valve for disengaging or operating the gyroscope thereby simplifying the mechanism of the torpedo while rendering it more certain in its operation

GRINDING AND PULVERIZING MILL.—J J Knight, Alameda Cal The invention relates more specifically to a mill in which communicating rollers are arranged in concentric circles upon a supporting member and have concentric pressure rings arranged upon each circle of rollers and held resiliently and adjustably in position thereupon to force the rollers firmly against the supporting member

WASHING MACHINE.—R Twohig, Salina Kan The intention is to provide a machine which can be driven by hand or by power in which clothes, household linen etc can be laundried efficiently in which the cleansing is effected by the pounding action of a beater upon the articles which are immersed in a washing fluid such as soapy water and in which the articles are positioned preferably upon a perforated false bottom

ROTARY VALVE.—S Yankauer New York N Y An object of this invention is to provide a valve in which the valve plug is resiliently held in place so that leakage is effectively prevented and in which the rotation of the valve in opening and closing the same tends to continually grind the valve plug and seat and maintain a perfect fit

GRADER OR DITCHING MACHINE.—W L Davis Wabbaseka Ark The invention comprises a pair of blades or boards which are disposed at an acute angle to each other the arrangement being such that when the implement is advanced one of these blades or boards presents itself in an inclined position so that its lower edge will operate as a scraper on the surface of the earth

MOUNTING FOR BOTTLE WASHING BRUSHES.—A N Davis New York N Y In the present patent the invention has reference to mechanism to be used in connection with bottle washing brushes the inventor's more particular purpose being to produce a mounting provided with a spring-controlled mechanical movement for holding the brushes in good position for washing the bottle

WRAPPING TWISTING AND POLISHING MACHINE.—W J Carey Trenton N J The purpose here is to provide a machine arranged to cover a plurality of wires or cores with paper or like wrapping material and then polish the covered cores and twist the same into a single strand in an exceedingly simple manner and in one operation

PARACHUTE.—T L. Zook, Lima Ohio In

this parachute rigid guys or braces operate in conjunction with a sail or kite to extend it and the inventor's objects are to provide means for effecting the opening of the parachute in descent to afford facilities for folding and stowing the device and to provide a durable and simple construction of the several parts of the parachute and its entirety

CAPPING MACHINE.—C. A. Youngman, Louisville, Ky. The intention of the inventor is to provide a machine arranged to press the cap or capsule snugly onto the head and neck of the receptacle without danger of marring the cap or capsule, or scratching or removing the paint, wax or other material with which the cap is decorated.

Railways and Their Accessories.

SWITCH MECHANISM.—F. F. Young, Lowell, Ohio. The invention pertains to railway switches, and particularly to the switches of light railways such as trolley tracks. The inventor's aim is to provide means for operating the switch from the car platform so as to obviate the necessity for operating the switch by hand.

AUTOMATIC SWITCH-STAND.—B. K. Staggs, Hachita, New Mex. An object here is to provide a switch in which the target will always indicate the true condition of the switch. This obviates a grave danger which arises from the use of switch stands of the ordinary kind since with this invention there must be a positive movement by some one who wishes the switch to be changed before the target will indicate such change. The change made the target will be shifted to indicate the change and will be positively locked in its shifted position.

LOCOMOTIVE ASH PAN.—J. S. Downing, Atlanta, Ga. The inventor's object is to provide a novel positively operating construction for discharging ashes from the ash pan. This is an automatic self-cleaning ash pan having a system of hoes attached to the piston rod and a cylinder adapted to receive fluid pressure for reciprocating the hoes in the ash pans for discharging the ashes thereon.

RAIL CHAIR AND BRACE.—K. Landerau, Cherry Valley, N. Y. The object of the invention is to provide a chair and brace by means of which railroad rails can be securely held in place upon the cross ties and which serve to brace the rails against lateral movement at curves and other points of the track where such bracing is necessary.

METALLIC CROSS-TIE AND RAIL CLAMP.—H. S. Kilbourne, Washington, D. C. An object of this invention is to provide a cross-tie of light weight but strong and durable. In carrying this out I-beams of standard sizes and shapes are used thereby reducing cost of manufacture. The tie requires but few bolts the main connecting member being a clamp of a peculiar form.

Pertaining to Recreation.

MOVING PICTURE DEVICE.—W. Hendrick, New Haven, Conn. The object of the present invention is to provide certain improvements in chaplets and shrines of the holy rosary whereby actuating mechanism is employed and the endless web containing pictures is properly actuated to accurately display one of the pictures at a time and to display the several pictures in the proper order according to the intended devotional exercise.

Pertaining to Vehicles.

THILL-COUPLING.—V. B. Henry and H. Fintel, Jr., Hardy, Neb. The main object in this case is to provide an improved means for enabling the draft eye to be detached or inserted while at the same time means are provided for holding the draft eye in close contact with the coupling pin to prevent rattling of the various parts.

POLE TIP.—J. W. Dean, Geary, Okla. The invention relates to tips for wagon poles and the like and more particularly such as have resiliently controlled means for securely holding a neck yoke in place on the pole. In operation the latch cannot drop out through the slot of the casing as the stop with its shoulders which are transversely disposed with respect to the slot is covered by the end of the pole.

PNEUMATIC TIRE.—P. I. Viel, 87 Rue de Rivoli, Paris, France. This invention relates to a tire characterized by the use of a lining formed of a metal cable of wire. This packing or lining is intended to entirely do away with ruptures resulting from excessive pressure or excessive weight or overheating and punctures. This lining diminishes in no way the flexibility of the tire.

BOLSTER.—J. Heimlicher, Defiance, Ohio. The aim in this instance is to provide a bolster for wagon bodies and the like which is light in weight and inexpensive to manufacture and which can be easily fashioned from standard structural iron or other metal pieces such as I-beams and channels.

Designs.

DESIGN FOR A CUT-GLASS DISH.—T. B. Clark, Honesdale, Pa. This highly ornamental dish is of a circular form and its height is about one-half the diameter of the top and open part. The pattern cuttings are of great variety and exquisite design.

DESIGN FOR A TOBACCO PIPE.—J. M. Tavran, Athens, Texas. The bowl in this ornamental design represents the body of a tree with several roots sawed off close at the base. The handle has a symmetrical curve. The words Dum Tacet Clamat are inscribed across the bowl and also large initial letters W O W arranged vertically.

NOTE.—Copies of any of these patents will be furnished by Munn & Co. for ten cents each. Please state the name of the patentee, title of the invention, and date of this paper.

NEW BOOKS, ETC.

THE COMMERCIAL PRODUCTS OF INDIA. By Sir George Watt. New York: E. P. Dutton & Co., 1908. 8vo., 1,189 pp. Price, $5.

This work is an abridgment of "A Dictionary of the Economic Products of India," which was published in 1889-4, and which has been out of print for some time. The government of India therefore decided that a correct and abridged edition should be brought out. The instructions provided that the work should be limited to a single volume the arrangement of which should follow that of the dictionary and should be confined to products which are at present of prospective industrial and commercial importance. The book is a monumental work, and represents a vast amount of labor. It will prove valuable to those who are in any way identified with Indian industries.

THE PHOTOGRAPHIC MANUAL. Edited by H. Snowden Ward. London: Dawbarn & Ward, Ltd. New York: Tennant & Ward. 12mo., 287 pp. Price, paper, 50 cents, cloth, $1, postage extra.

This is the fifth edition of an excellent English manual which incorporates the figures, facts, and formulæ of photography, and is a guide to their practical use and is intended for all photographers. This collection of formulæ is one of the best that we have ever seen. It is a book which should be in the hands of every photographer.

THE ANGLER'S GUIDE. A Manual for Campers and Anglers. Edited by Wainwright Randall. New York: The Field and Stream Publishing Company, 1909. 18mo., 242 pp. Price 50 cents.

This little volume contains a description of all popular fresh water and salt water fish. It describes tackle and bait for the expert angler; it gives complete information on how, when and where to fish, and a summary of the fishing resorts of the United States and Canada. The book is admirably arranged, and is very well printed. Its form is so convenient that it can be carried in the pocket. Among the features which appeal to us particularly are the views and plans of bungalows, the fishing charts and the directions for preparing food suitable for a fishing camp. The book should be in the possession of every fisherman.

THE DIRECTORY OF DIRECTORS IN THE CITY OF NEW YORK. New York: The Audit Company, 1909. 12mo., 860 pp. Price $5.

The tenth edition of this useful work has just come from the press, and maintains the reputation of its predecessors for completeness and reliability. The Directory this year contains over 32,000 directors, each director's name being followed first by the name of the firm or company with which he is directly associated, and then by all the companies in which he is a director. Select lists of corporations in banking, insurance, transportation, manufacturing and other lines of business, alphabetically arranged, accompanied in each case by the names of the company's officers and directors, are to be found in the appendix as well as a list of the principal exchanges in New York with their officers and managers. This is a book which no business house dealing with a large number of companies or their stocks and desiring to know by whom their clients' interests are controlled, can afford to be without.

THE IMPLEMENT BLUE BOOK. St. Louis: Midland Publishing Company, 1909. 8vo., 460 pp.

This is a very useful book of reference for all users of or dealers in vehicles of all kinds, agricultural machinery and implements. A remarkable feature is the simplicity with which one can find any name or subject heading one wants, the book being described as "self-indexed, double-indexed and cross-indexed." It begins with a classification of manufacturers in the alphabetical order of the implements they make, following with vehicles in the same manner. Then comes a list of manufacturers in alphabetical order with lists of the specialties they make and then a list of branch jobbing and transfer houses in geographical order with the names of manufacturers whose lines they handle.

ENGINE LATHE WORK. By Fred H. Colvin. New York: Hill Publishing Company, 1909. 16mo., pp. 180. Price $1.

The writer is Assistant Editor of the American Machinist, and is the author of many well-known books on mechanical subjects. The present volume gives practical suggestions which will give the young machinist or apprentice the foundation principles of engine lathe work. The illustrations number 127, and are well executed. The author states that while the suggestions have been written especially for those with a limited experience, it is quite probable that many of the ideas and suggestions may be new to some of the older men who have not had a chance to see what other shops were doing.

RADFORD'S ARTISTIC BUNGALOWS. Unique Collection of 208 Designs. Chicago and New York: The Radford Architectural Company, 1908. 4to., pp. 221. Price, $1.

In the last three years the number of bungalows which have been built in the United States has increased by leaps and bounds, and whole farms are being split up into lots for the erection of bungalows consisting of from two to five or more rooms. The work before us consists of a collection of wash drawings and floor plans. Plans and specifications for any of them are furnished by the publishers at moderate rates. The illustrations are hardly as attractive as they would be if they were made from photographs of bungalows which have actually been built.

THIRD REPORT OF THE WELLCOME RESEARCH LABORATORIES AT THE GORDON MEMORIAL COLLEGE, KHARTOUM. Andrew Balfour, M.D., B.Sc., F.R.C.P. Edin., D.P.H. Camb., Director. Published for Department of Education, Sudan Government, Khartoum, by Bailliere, Tindall & Cox, 8 Henrietta Street, Covent Garden, London. Depot for U. S. A.: Toga Publishing Company, 45 Lafayette Street, New York city, 1908. 4to., pp. 476.

The admirable work conducted in the Wellcome Research Laboratories is undoubtedly familiar to our readers. The laboratories were established to promote technical education in general; to further the study of tropical disorders, especially the infective diseases of both man and beast peculiar to the Sudan; to render assistance to the officers of health and to the clinics of the civil and military hospitals; to aid experimental investigations in poisoning cases by the detection and experimental determination of toxic agents, particularly the obscure potent substances employed by the natives of the Sudan; to carry out such chemical and bacteriological tests in connection with water, food stuffs, and health and sanitary matters as may be found desirable; to promote the study of disorders and pests which attack food and textile produce and other economic plant life in Sudan; and to undertake the testing and assaying of agricultural, mineral and other substances of practical interest in the industrial development of the Sudan. The two volumes of reports previously issued by the laboratories cover the period from the foundation of these laboratories in 1903 to 1906. The third report completes the record up to 1908. The work of the laboratories has been so far extended that the latest report contains some 480 pages of detailed records of many interesting experiments, and researches principally connected with tropical medicine. The volume is profusely illustrated and includes many valuable colored plates. Simultaneously with the Third Report and as a Supplement to it is published a Review of the Progress made in Tropical Medicine during recent years, compiled by Dr. Balfour and Dr. R. G. Archibald.

DICTIONARY OF CHEMICAL AND METALLURGICAL MACHINERY, APPLIANCES AND MATERIAL MANUFACTURED OR SOLD BY ADVERTISERS IN ELECTRO-CHEMICAL AND METALLURGICAL INDUSTRY. First Edition. New York: Electro-Chemical and Metallurgical Industry, 1909. 12mo., pp. 182. Price 50 cents.

LA MORPHOLOGIE DE L'INSECTE. Par Charles Janet. Limoges, France: Imprimerie-Librairie Ducourtieux et Gout, 1909.

INDEX OF INVENTIONS

For which Letters Patent of the United States were issued for the Week Ending August 17, 1909,

AND EACH BEARING THAT DATE

[See note at end of list about copies of these patents.]

Adding machine, C. W. Gooch	931,410
Addressing machine, W. F. Kellett	931,619
Advertising device, M. H. Singer	931,509
Advertising machine, F. W. Remer	931,218
Aerodart, C. R. Bannihr	931,036
Air brake, Turner & Farmer	931,337
Air brake system, E. M. Swift	931,324
Air motor or locomotive, Pittman & Harrison	931,048
Air ship, R. Schmiechen	931,[illegible]
Amusement device, F. W. Nall	931,129
Annunciator board, J. Sickel	931,548
Armature for alternating current motors, winding of, B. G. Shipman	931,150
Atomizer, Venner & Brown	931,340
Automobile lock, Orim & Lay	931,094, 931,095
Automobile rear axle, F. C. Miller	931,461
Automobile wheel, J. A. Fleming	931,408
Awning, M. L. Bond	931,[illegible]
Axle bearing device, car, J. W. Stephenson	931,056
Axle box lubricating device, car, H. C. Gamage	931,058
Bag bundling device, G. J. Naeman	931,468
Baker's goods, milk, postal packages, newspapers, and the like, arrangement for receiving, W. Richelmaut	931,295
Baking powder, W. A. Beatty	931,067
Baking utensil, potato, J. F. Fairbanks	931,567
Basin, toilet, W. Rieck	931,400
Batteries, preparing alkaline electrolytes for storage, D. P. Perry	931,088
Battery elements, preparing storage, D. P. Perry	931,061
Bearing for upright shafts, step, W. H. Larrabee	931,469
Beater, M. A. Valz	931,100
Bed bottom, W. Shannon	931,140
Bed or douche pan, Williams & Scott	931,[illegible]
Bedstead lock or joint, M. D. L. Martin	931,[illegible]
Beer drawing apparatus, Handy & Phillips	931,307
Bell ringer, E. Wilson	931,108
Bell striker, T. L. Wilson	931,178
Bilge drainer, C. W. Moore	931,623
Biscuits, machine for making shredded wheat, W. E. Williams	931,543
Bit. See Boring bit	
Blast and pressure meter, H. H. Nebuls	931,348
Blasting device, J. Phillips	931,581
Blowpipe, E. S. Kimball	931,088
Boat, W. N. Bell	931,177
Boat and tent, convertible, J. Vaghi	931,[illegible]
Boiler tube cleaner, J. Zilliox	931,348
Boll weevil exterminator, J. W. Evans	931,404
Bolt and nut lock, Regnas & Chapman	931,107
Book holder, E. R. Antisdale	931,311
Book, loose back, C. Chivers	931,679
Boring bit, expansible, L. W. Garner	931,608
Bottle, L. V. Phillips	931,316
Bottle cap, A. M. Miller	931,460
Bottle filling and capping head, G. Kirkegaard	931,634
Bottle filling and capping machine, T. G. Redington	931,040
Bottle filling machine, T. Roberts	931,244
Bottle stopper, G. Kirkegaard	931,635
Box, S. Bachmann	931,373
Box, A. Sabor	931,658
Box strap reel, A. Griesbeck	931,394
Braid cord making and similar machines, carrier for, A. Petersen	931,063
Braiding machines, etc., carrier for, A. Petersen	931,064
Brake shoe adjuster, O. S. McCurdy	931,219
Bread raiser, J. M. McIntosh	931,075
Brick molding machine, C. Simpson	931,154
Brine cooling apparatus, G. F. Dickman	931,687
Broom, S. F. Frasier	931,390
Brush, F. M. Hanaway	931,603
Brush, rotary tooth, C. L. Phillips	931,141
Brush stud support, B. A. Behrend	931,376
Building block molding machine, A. L. Post	931,664
Burglar alarm, G. J. Deffner	931,398
Burglar screen, K. A. Wayland	931,[illegible]
Cabinet for the sacristy, H. A. McEachen	931,[illegible]
Cable hanger clamp, N. B. & G. B. Dusinberre	931,399
Cager and sump guard, G. Holmes	931,276
Calorimeter, C. J. Emerson	931,159
Can capping machine, G. W. E. Brooks	931,368
Can filling machine, C. S. Bucklin	931,641
Cans and their heads, machine for clearing sheet metal, Adriance & Calleson	931,082
Cans to operating mechanisms, device for feeding, Krummel & Taliaferro	931,494
Candy, sugared nut, McDonald & Hopson	931,157
Cap, miner's, I. M. McPherson	931,468
Caps, device for applying protectors to fulminating, W. E. Miller	931,454
Capping machine, C. A. Youngman	931,244
Capping machine head, G. Kirkegaard	931,636
Car coupling, G. E. Tomlinson	931,097
Car coupling, R. F. Poindexter	931,385
Car draw bar and extension shank, M. A. Garrett	931,196
Car fender, G. W. Mahan	931,326
Car framework, N. C. Anderson	931,555
Car side bearing, railway, J. F. Courson	931,681
Carbureter, M. D. Colbath	931,306
Carton, G. Morton	931,074
Carton, egg, R. M. Odell	931,[illegible]
Cash register attachment, O. K. Slotto	931,549
Casket lamp for hearses or funeral cars, adjustable, Roe & Astes	931,400
Celery bleaching sleeve, C. W. Mark	931,[illegible]
Celluloid article, colored, O. Muller	931,394
Cement and making same, package of sticky, A. Thoms	931,590
Centrifugal apparatus, H. E. Warren	931,707
Centrifugal screen, W. R. Cunningham	931,380
Characters on sheet material, machine for impressing, C. B. Stillwell	931,188
Chasing mill working in looped paths, G. Ehrich	931,[illegible]
Check receptacle, C. Boulard	931,[illegible]
Chenille strip manufacturing mechanism, W. P. Zimmermann	931,345
Chilian mill, W. B. Easton	931,180
Chuck, drill, C. W. Mandel	931,387
Chuck release, lathe, W. L. White	931,167
Churn, M. V. Dudley	931,548
Cigar, F. Meyer	931,689
Cigar machine, F. E. Kelsey	931,514
Cigarette detachable and collapsible tip, O. A. Drecktlieb	931,282
Circle divider, N. Perris	931,680
Circuit breaker, Browne & Howell	931,294
Clasp. See Veil clasp.	
Clasp, Albertoni & Tremanno	931,[illegible]
Clock, electric self-winding, Steiger & Besancon	931,187
Clock register, nautical, T. Cunningham	931,279
Clutch, J. Schneider	931,502
Clutch, M. H. Fischer, release	12,999
Clutch, car cable, H. A. Robinson	931,099
Clutch mechanism for printing, stamping and die presses and the like, friction, M. Rockstroh	931,681
Coal scuttle, D. O. Hedges	931,305
Coat fastening means, W. S. Barker	931,390
Coating articles, dipping process for, W. G. Scott	931,309
Coating composition, receptacle, W. R. Long	931,524
Cock, safety gas, O. B. Healy	931,151
Coin controlled mechanism, F. M. Davis	931,374
Coke loader, Wright & Monroe	931,118
Collection box, R. B. Adams	931,048
Colliery and other inclines, safety appliance for, J. Morton	931,273
Combination rack, Haas & Olsen	[illegible]
Commutator, dynamo electric machine, J. E. Webster	931,[illegible]
Commutator, dynamo electric machine, E. G. Lamme	[illegible]
Compasses, attachment for, A. M. Washburn	[illegible]
Compound, H. M. Sinclair	[illegible]
Concrete construction, reinforced, [illegible]	[illegible]
Concrete construction, reinforced, [illegible] Large	[illegible]
Concrete molding machine, [illegible]	[illegible]
Concrete mold, D. R. [illegible]	[illegible]

60 YEARS' EXPERIENCE

PATENTS

TRADE MARKS
DESIGNS
COPYRIGHTS &c.

INVENTORS are invited to communicate with Munn & Co., 361 Broadway, New York, or 625 F Street, Washington, D. C., in regard to securing valid patent protection for their inventions. Trade-Marks and Copyrights registered. Design Patents and Foreign Patents secured.

A Free Opinion as to the probable patentability of an invention will be readily given to any inventor furnishing us with a model or sketch and a brief description of the device in question. All communications are strictly confidential. Our Hand-Book on Patents will be sent free on request.

Ours is the Oldest agency for securing patents; it was established over sixty years ago.

A NEW SPEED INDICATOR FOR MARINE PROPELLERS.

(*Continued from page 156.*)

function enters largely Each marine plant has its most efficient cruising speed, and in the case of cargo-bearing merchant marine vessels, every pound of coal saved means increased earnings also increased cruising area to warships. When this economical speed had been determined, with a tachometer system consisting of a plurality of indicators distributed about the vessel to guide, the engines can be kept at this rate of speed accurately and with but slight effort. The captain, in his cabin or on the bridge the chief engineer when off duty—all can keep track of exactly what rotation speed is being maintained

The accuracy of dead reckoning is greatly facilitated by an exact knowledge of what engine speeds have obtained during stated and frequent intervals of time instead of having to take the total number of revolutions over a protracted period and guess roughly at the distance traveled, because the distance traveled per minute by the ship at say 100 R P M is not increased in proportion when 125 R P M. obtains. Therefore, during long periods the rate of speed of the shaft may vary considerably with no tachometer to guide the man at the throttle.

Efforts along this line have been made for a number of years but have been productive of no dependable and accurate device prior to the invention of the system which is the subject of this article

Centrifugal devices are not susceptible to mechanical transmission to various remote parts of the vessel, and lack extreme accuracy over protracted periods of operation Pneumatic devices operated by air-pumps actuated by the propeller shaft are less accurate Electrical tachometers have failed in accuracy heretofore because of the error introduced, and varying from day to day by rubbing or abutting contacts becoming foul, thereby introducing a resistance in the circuit with corresponding inaccuracy of reading of a voltmeter operated by the dynamo calibrated in R P M of the propeller shaft Owing to the former use of direct-current instruments commutators and brushes were necessary on the magneto The spring tension of these brushes varied the commutator became oxidized and covered by oil from the bearings, and considerable error crept in As a warship going ten knots per hour with engines turning over 72 R P M is not traveling ten knots at 71 or 70 R. P M, it is seen that a tachometer, to be of value, must be accurate to a fraction of a revolution, and maintain its calibration

All reciprocating engines owing to the use of connecting rods between the crank and the piston impart rotation to their shafts of constantly varying angular velocity The fewer the number of cylinders or the slower the speed of rotation the greater this variation These variations are smoothed out more or less by the *flywheel on the stationary engine* but a marine engine has no flywheel except a propeller the weight of which is not sufficient to possess flywheel action to any extent Therefore, any tachometer actuated by the propeller shaft by gearing or otherwise, has imparted to it an unsteady rate of speed If the tachometer is geared up to the shaft so that it will rotate faster than the shaft, any momentary irregularity in the revolution of the main shaft is multiplied in the tachometer proportionally to the ratio of gearing between the main shaft and the tachometer Therefore whatever indicating device is used in connection with the tachometer will pulsate, and the reading of the pointer on the scale of the instrument will be largely a matter of guesswork between two values of low and high. Hence it is evident that some sort of compensating device must be used to take up these momentary fluctuations of the propeller shaft, and impart to the generator of the tachometer a steady av-

How to Construct An Independent Interrupter
In SCIENTIFIC AMERICAN SUPPLEMENT 1615, A. Frederick Collins describes fully and clearly with the help of good drawings how an independent multiple interrupter may be constructed for a large induction coil.
This article should be read in connection with Mr. Collins' article in SCIENTIFIC AMERICAN SUPPLEMENT, 1605, "How to Construct a 100-Mile Wireless Telegraph Outfit."
Each Supplement costs 10 cents; 20 cents for the two. Order from your newsdealer or from
MUNN & CO., 361 Broadway, New York

FRICTION DISK DRILL
FOR LIGHT WORK.
Has These Great Advantages:
The speed can be instantly changed from 0 to 1600 without stopping or shifting belts. Power applied can be graduated to drive, with equal safety, the smallest or largest drills within its range—a wonderful economy in time and great saving in drill breakage. Send for Drill Catalogue.

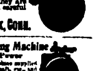
BARKER MOTORS
Reliable.—1½ to 10 H P—Economical
Their perfect operation and reliability are due to common sense mechanical ideas and good construction. While low in price, they are made of best materials with careful attention to details.
C. L. BARKER, NORWALK, CONN.



Pipe Cutting and Threading Machine
For Either Hand or Power
This machine is the regular hand machine supplied with a power base pinion, countershaft, etc., and can be worked as an ordinary power machine or taken from its base for use as a hand machine. Pipe ½ in. to 15 in. diameter handled easily in small room. Illustrated catalogue—price list free on application.

Two Good Books for Steel Workers

Hardening, Tempering, Annealing and Forging of Steel
By JOSEPH V WOODWORTH
Size 6½ x 9½ inches. 288 pages. 201 illustrations Price $2 50 postpaid
THIS is a practical work treating clearly and concisely modern processes for the heating, annealing, forging welding hardening and tempering of steel making it a book of great value to toolmakers and metal working mechanics in general Special directions are given for the successful hardening and tempering of steel tools of all descriptions, including milling cutters, taps, thread dies, reamers, hollow mills, punches and dies and various metal-working tools, shear blades, saws, fine cutlery and other implements of steel both large and small. The uses to which the leading brands of steel may be adapted are discussed, and their treatment for working under different conditions explained also special methods for the hardening and tempering of special brands. A chapter on case-hardening is also included.

The American Steel Worker
By E. R. MARKHAM
Size 6¾ x 8 inches. 367 pages. 163 illustrations. Price $2 50 postpaid
THIS is a standard work on selecting, annealing, hardening and tempering all grades of steel by an acknowledged authority The author has had twenty-five years practical experience in steel-working during which time he has collected much of the material for this book. Careful instructions are given for every detail of every tool Among the subjects treated are, the selection of steel to meet various requirements, how to tell steel when you see it; reasons for different steels; how to treat steel in the making of small tools, taps, reamers, drills, milling cutters; hardening and tempering dies; pack-hardening, case-hardening annealing; heating apparatus; mixtures and baths, the best kind, and why; and in fact everything that a steel-worker would want to know is contained in this book.
OUR SPECIAL OFFER: The price of these books is $2.50 each, but when the two volumes are ordered from us at one time, we send them prepaid to any address in the world on receipt of $4.00.

A pure Havana filled cigar for 2 cents
(Prepaid anywhere)
Yes—Pure Havana
Grown on the Isle of Cuba—
Imported from Cuba—
Put into this cigar by us—
Guaranteed pure Havana by us
Is there any way to make it stronger?
Mr Smoker—You don't have to be told that there *is* such a thing grown as real Havana tobacco.
You *know* there is.
You have tasted it. You know that no other tobacco *ever* gave you that delightful, rich, tasty smoke that Havana tobacco does.
But the cost!
The point you want to know—have to be shown—is this:
Is it possible to sell a genuine, pure Havana filled cigar of "decent" size for 2 cents?
It certainly is—and here it is:
Santa Glorias Box 50 Prepaid $1.00
Exact size and shape shown. A clean, thoroughly cured York State wrapper with genuine Havana filler. A quickly rolled cigar—not expensively finished—but substantially made. Will please 99 out of 100 experienced, exacting smokers.
SANTA GLORIAS can be had of dealers everywhere. If you have the slightest difficulty in locating them, just send a dollar bill with your name and address to the makers.
R. & W. JENKINSON CO.
Whose word in the tobacco world is as good as a bond. 49th Year—600 Employees
1162 Liberty Ave., Pittsburg, Pa.

Save Money by Machinery!
You can do this easily with the right machine in all furniture factories.
DODDS' TILTING CIRCULAR SAW
tilts to 45 degrees, simplifies the work and insures perfect accuracy in cutting. Removable throat in table. 12-inch rip or cross-cut saw with each machine Write for free illustrated catalogue and price list.

A Home-Made 100-Mile Wireless Telegraph Set
Read SCIENTIFIC AMERICAN SUPPLEMENT 1605 for a thorough clear description by A Frederick Collins, of the construction of a 100-mile wireless telegraph outfit Numerous adequate diagrams accompany the text Price 10 cents by mail Order from your newsdealer or from
MUNN & CO., 361 Broadway, New York

Let us send you Popular Electricity [illegible]
Here is a magazine which should be in every home—which will vitally interest every member of the family Each and every number contains a wonderful fund of electrical knowledge—in plain English—its articles are written—free from technical terms—so plainly that all can understand—so entertainingly that man, woman and child are held under a spell of interest. It treats every principle and possibility of electricity in industrial and home life. Such subjects are covered as:
Wireless Telegraph Automatic Telephone
Electric Cow Milking Electric Plant Growing
Electric Air Making Electric Chicken Hatching
and thousands of wonderful new applications of electricity in as many ways all over the world
Spécial Free Offer
We know that you will be more than pleased with this bright, snappy magazine and just to prove it to you we make this offer Simply fill in the coupon below and send us the price of a year's subscription, $1 (Canadian, $1 35, Foreign $1 50). We will date your subscription three months ahead and send you the first three issues absolutely free of cost. Read them and if at the end of that time you are dissatisfied tell us so and we will return your subscription money in full. This is a limited time offer—so write today and get three issues free and your money back if you want it.
Popular Electricity Publishing Co.
1222 Monadnock Block, Chicago
Enclosed find $1.00 (Canadian $1.35, Foreign $1.50) for fifteen months subscription to Popular Electricity It is understood that you will refund the full subscription price if at the end of three months I am not satisfied in every way
